Resolved That the House of Delegates authorize and direct the Board of Trustees and the Committee on Legislation to seek to obtain the amendment of the Federal Narcotic Act to provide that all mixtures and compounds containing codeine, dihydrocodeine, or dihydrohydroxycodone in combination with other nonnarcotic ingredients may be dispensed upon an oral including telephonic prescription which must be reduced to writing by the pharmacist and to cooperate with the American Pharmaceutical Association and the National Association of Retail Druggists in pursuing this objective

Report of Reference Committee on Hygiene and Public Health

Dr Everett P Coleman, Chairman, presented the following report, which was adopted

Your reference committee considered a resolution presented by Dr Raymond M McKeown of the Oregon State Medical Society, concerning amendment of the Federal Narcotic Act to provide for dispensing of codeine mixtures and compounds on oral prescription. Your committee realizes that many corrections should be made in the field of narcotic prescription and that many needless hardships are forced on patients, pharmacists and physicians. However, it feels that the resolution is not sufficiently inclusive and recommends that it be not adopted in its present form, but that the entire subject matter be referred to the Board of Trustees for subsequent referral to the proper committee for more complete study

Resolution on Health and Welfare Funds

Dr James Z Appel, Pennsylvania, introduced the following resolution, which was referred to the Reference Committee on Insurance and Medical Service

WHEREAS Certain developments in the administration of the program of the United Mine Workers Welfare and Retirement Fund have taken place in Pennsylvania that seem to threaten the private practice of medicine and may result in the deterioration of the quality of medical services in these areas and

WHEREAS The Board of Trustees of the Medical Society of the State of Pennsylvania has instructed its delegates to present this matter to the House of Delegates of the American Medical Association for its most urgent consideration be it

Resolved That the American Medical Association through its proper committees immediately study this problem in order to ascertain the true objectives and methods of operation of all health and welfare funds

Report of Reference Committee on Insurance and Medical Service

Dr Gerald V Caughlan, Chairman, submitted the following report, which was adopted

A resolution introduced by the Pennsylvania delegation relative to health and welfare funds being used to set up clinics and hospitals, was studied by your reference committee. This matter deals with cooperative medicine, and your committee recommends that it be referred to the Council on Medical Service

Resolutions on Gamma Globulin

Dr Robert B Homan Jr, Texas, introduced the following resolutions, which were referred to the Reference Committee on Hygiene and Public Health

WHEREAS Gamma globulin, a derivative of whole blood, is now being used for the prevention or attenuation of measles, infectious hepatitis and poliomyelitis and

WHEREAS The Office of Defense Mobilization is "the allocating authority for gamma globulin" which blood product is to be released or allocated through the state or territorial health departments to local county health departments or county health officers according to a formula based on previous and present incidence of measles, infectious hepatitis and poliomyelitis in each community and

WHEREAS Gamma globulin under this program will be distributed free, without charge regardless of the ability of the exposed person or his family to pay although the family doctor may charge "for his services" in administering this product, and

WHEREAS In order to implement this program the National Foundation for Infantile Paralysis has contracted to purchase all gamma globulin available from commercial sources at a cost of \$11 000 000 from funds donated by the public to this Foundation through the March of Dimes and other fund raising methods and

WHEREAS The cost of the gamma globulin to the individual user would in most instances not be prohibitive and

WHEREAS The fund donated by the people of this country to the Foundation to combat polio and to care for the afflicted is greatly needed for research and for the treatment of individual cases the cost of which would be prohibitive to the individual in many instances and

WHEREAS Such free dispensing of prophylactic products or medical care both preventive and curative regardless of ability to pay is contrary to the American system now therefore be it

Resolved That the House of Delegates of the American Medical Association favor and sponsor any move to require that gamma globulin so distributed among the various communities be purchased by the individuals receiving it when the cost is not prohibitive to the individual or his family in order that the funds in the treasury of the National Foundation for Infantile Paralysis may be used for much needed research and for the care of afflicted individuals such research certainly and such care most often being prohibitive in cost to the individual and his family and be it further

Resolved That funds so collected be returned to the treasury of the National Foundation

Report of Reference Committee on Hygiene and Public Health

Dr Everett P Coleman, Chairman, submitted the following report, which was adopted

Your Reference Committee on Hygiene and Public Health considered the resolution submitted by Dr Robert B Homan Jr, of Texas, on Gamma Globulin Your committee recommends that the House of Delegates of the American Medical Association favor any move to encourage individuals receiving gamma globulin to contribute to the cost of the material used, so that the National Foundation for Infantile Paralysis and the American Red Cross may replace, in part, funds used for this purpose and that such funds be available for much needed research and for the care of afflicted individuals

Resolution on Revision of Principles of Medical Ethics

Dr Russell V Lee, Section on Military Medicine, introduced the following resolution, which was referred to the Reference Committee on Miscellaneous Business

Resolved To substitute for Chapter I, Sections 1 and 2 of the Principles of Medical Ethics the following section 1

We physicians affiliated with the American Medical Association recognizing that in common with physicians of the entire world we are only trustees for the benefit of all mankind of the great treasure of medical knowledge and skill accumulated throughout the ages accept with the trusteeship certain obligations as follows (1) To make these benefits accessible to all who need them insofar as facilities permit, (2) to exercise these skills for the benefit of all humanity, (3) to strive constantly to improve ourselves in knowledge and skill (4) to teach our art to all of good character who have the desire and capacity to learn insofar as proper means can be developed (5) to increase by research and other means this share of knowledge and to make our discoveries freely available to all physicians, (6) to resist all attempts to misuse our services for political purposes while freely discharging all our obligations as citizens (7) to devote our skills to the alleviation of suffering and the deferment of death and never for any reason to the termination of human life (8) to aid and support our medical colleagues in all countries in the attainment of proper humanitarian objectives (9) to maintain in our relationships with our patients our colleagues and the public the strictest standard of personal honor and (10) to dedicate our knowledge and skills and our lives to the alleviation of suffering the prolongation of life and the enrichment of living for all men without thought of any personal advantage or gain

Report of Reference Committee on Miscellaneous Business

Dr Walter P Anderton, Chairman, presented the following report, which was adopted

With respect to the resolution by Dr Russel V Lee of the Section on Military Medicine suggesting revision of the Principles of Medical Ethics, your committee recommends referral of this resolution to the Council on Constitution and Bylaws for its consideration in the forthcoming revision of the Principles of Medical Ethics

Resolution on Disapproval of Executive Order of President of the United States

Dr Hugh H Hussey, District of Columbia, introduced the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS President Eisenhower's Executive Order 10450 dated April, 29 1953 dealing with security requirements for government employees stated that among the threats to Government security are the following: An adjudication of insanity or treatment of serious mental or neurological disorders without satisfactory evidence of cure (Sec 8 (a) (1) (iv) and

WHEREAS This Order has singled out two groups of illnesses from the total mass of human ills each of which may have psychological complications and

WHEREAS It is recognized that employees with severe mental illness as well as those with other illnesses may in some instances constitute a threat to government security and

WHEREAS Well-established personnel policies now provide leave of absence in the event of serious illness and

WHEREAS The extent of illness can in each instance be determined only by a qualified doctor of medicine and

WHEREAS The Order would seriously discourage employees from seeking medical treatment thereby destroying medicine's most effective tools, namely early diagnosis and treatment and

WHEREAS The Order indicates a need for a critical survey of the relation of all illnesses among government employees to the total subject of security therefore be it

Resolved That the House of Delegates of the American Medical Association instruct the Association's Board of Trustees to recommend to the President of the United States (1) that he rescind Section 8 (a) (1) (iv) on the ground that it is unscientific unnecessary and damaging and (2) that he direct that the subject of illness among government employees as related to security be further reviewed

Report of Reference Committee on Legislation and Public Relations

Your committee has studied with interest the resolution introduced by Dr Hussey of Washington, D C, concerning the relation of all illnesses among government employees to the total subject of security This matter is one which requires careful consideration and study It is recommended that this matter be brought to the attention of the Special Medical Assistant to the Secretary of Health, Education, and Welfare, who is soon to be appointed

Message from San Francisco

Dr George F Lull, Secretary, read the following telegram from the President of the San Francisco Medical Society, Dr Edwin J Morrissey

The San Francisco Medical Society is delighted that the American Medical Association will have its next meeting in San Francisco We will do everything in our power to see that the 1954 convention is the usual success

Supplementary Report of Reference Committee on Credentials

Dr William Weston, Chairman, reported that 182 out of 185 delegates had registered

Statement Re Action of Board of Trustees in Calling Special Session of House of Delegates

Dr Thurman B Givan, New York, presented the following statement, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary

At a meeting on May 31 1953 of the members of the House of Delegates of the American Medical Association representing New York State, it was the unanimous opinion that complete accord be granted by said delegates with the action of the Board of Trustees of the American Medical Association in calling together the House of Delegates of the American Medical Association in Washington D C. on March 14 1953

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr H Russell Brown, Chairman, presented the following report, which was adopted

Your committee has studied carefully the statement introduced by Dr Thurman B Givan of New York on the subject of the Special Session of the House of Delegates on March 14, 1953, and wishes to offer the following report It is the opinion

of your committee that the Board of Trustees acted in the best interest of our profession in calling the Special Session of the House of Delegates on March 14, 1953

Resolutions on Membership in American Medical Association Sections

Dr R J Azzari, New York, introduced for Dr Thomas M d'Angelo, New York, the following resolutions, which were referred to the Reference Committee on Amendments to the Constitution and Bylaws

WHEREAS The American Medical Association's several scientific sections constitute in most instances the only representative unrestricted nation wide organization in their respective specialties, and

WHEREAS Membership in these sections is presently determined by members indicating their specialty at the time of registration for the annual meeting and

WHEREAS This system makes for a fluctuating membership depending on attendance at the annual meetings and

WHEREAS Certain International federations of specialty societies (like the International Congress of Ophthalmology) maintain that it is difficult to recognize the sections of the American Medical Association as representative organizations because of the indefiniteness of their membership therefore be it

Resolved That the method of enrolling as members of the several sections be altered so that a member will indicate his specialty membership preference at the time of paying his American Medical Association dues instead of being required as at present to be present at the annual meeting and be it further

Resolved That the Secretary of the American Medical Association cause to be prepared rosters showing the names of those who have indicated their desire to become members of the several sections and these lists so prepared shall constitute the membership rolls of the several sections so long as these members remain in good standing

Report of Reference Committee on Amendments to the Constitution and Bylaws

Dr John W Green, Chairman, presented the following report, which was adopted

Resolution on Membership in American Medical Association Sections This resolution was considered by your reference committee in conference with the Secretary of the Association, and your committee approves this resolution and recommends its adoption

Resolutions on Annual Medical Progress Day

Dr R J Azzari, New York, introduced the following resolutions, which were referred to the Reference Committee on Hygiene and Public Health

WHEREAS The progress and achievements of medicine are momentous and continue to advance at a most encouraging and gratifying rate and

WHEREAS Positive and accurate information concerning this progress and greater recognition of it by the public are urgently needed and

WHEREAS Our national administration is cognizant and highly appreciative of these noteworthy and humanitarian advancements, now therefore be it

Resolved That the House of Delegates of the American Medical Association request the President of the United States of America to proclaim annually an appropriate day of the year to be known as Medical Progress Day and be it further

Resolved That suitable recognition of this occasion be promoted through all possible media for the information of the public concerning the aims ideals and achievements of modern medicine

Report of Reference Committee on Hygiene and Public Health

Dr Everett P Coleman, Chairman, submitted the following report, which was adopted

Resolutions on Annual Medical Progress Day Your committee approves this resolution in principle, but as it may, if successful, require time and the expenditure of funds on the part of state and county medical societies, your committee feels that without further information this recommendation might be unwise and that such a day might be combined with Hospital Day or with a Doctors Day which has been inaugurated in some parts of the country by the Woman's Auxiliary On this account, your committee feels it may be better to refer this resolution to the Board of Trustees for study

Resolution on Clarification of Section 5 of Principles of Medical Ethics

Dr Millard D Hill, North Carolina, introduced the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and Bylaws

Resolved That the Executive Council of the Medical Society of the State of North Carolina in meeting February 15 1953 at Raleigh North Carolina recommends to the American Medical Association that it clarify Section 5 Chapter III of the American Medical Association Principles of Medical Ethics related to the subject of fee splitting and that the provisions of said section be elaborated

Report of Reference Committee on Amendments to the Constitution and Bylaws

Dr John W Green, Chairman, submitted the following report, which was adopted

Resolution on Clarification of Section 5 of Principles of Medical Ethics Your committee believes that this refers to Section 5, Article 6, Chapter III, of the Principles of Medical Ethics Your committee feels that this section covers the situation, but it also feels that it should be referred to the Board of Trustees for further study, because the subject is too broad to settle at this time

Resolution on Proposed Change in Make Up of Nominating Committees of Scientific Sections

Dr Edward L Compere, Section on Orthopedic Surgery, introduced the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and Bylaws

WHEREAS Section 7 of Chapter VII of the Bylaws specifies that the executive committee of each section except for the Section on Miscellaneous Topics shall act as the nominating committee of the Section and

WHEREAS This nominating committee so constituted includes the secretary and the section delegate and

WHEREAS It has been found to be advisable by most of the sections to elect both the secretary and the delegate for several years and

WHEREAS The secretary and the delegate may be embarrassed to be in the position of appearing to help to renominate themselves year after year therefore be it

Resolved That the last sentence of Section 7 of Chapter VII be changed to read as follows "The nominating committee of the section shall consist of the chairman and the last two previous chairmen except for the Section on Miscellaneous Topics."

Report of Reference Committee on Amendments to the Constitution and Bylaws

Dr John W Green, Chairman, presented the following report, which was adopted by more than the two thirds vote that the Vice Speaker declared was necessary to effect the indicated change in the Bylaws

Resolution on Proposed Change in Make-Up of Nominating Committees of Scientific Sections Your reference committee approves this resolution and recommends its adoption

Resolution on Prescriptions in Code

Dr R J Azzari, New York introduced the following resolution, which was referred to the Reference Committee on Hygiene and Public Health

WHEREAS It has come to the attention of the American Medical Association that certain physicians have entered into arrangements with pharmacists in the dispensing of prescriptions in code and

WHEREAS This procedure prevents a patient from going to the pharmacist of his choice and

WHEREAS Such procedure lends itself to the overcharging for prescriptions and

WHEREAS The dispensing of secret remedies is contrary to the Principles of Medical Ethics of the American Medical Association and contrary to the avowed traditions and principles of the medical profession therefore be it

Resolved By the House of Delegates of the American Medical Association at the 102d Annual Session that all physicians who engage in such practices are guilty of unethical practices and should be disciplined by their local societies

Report of Reference Committee on Hygiene and Public Health

Dr Everett P Coleman, Chairman, presented the following report, which was adopted

Resolution on Prescriptions in Code The use of codes in prescriptions is in use in some large institutions as a matter of convenience but the codes are not secret and are available to druggists if the patient desires to get the prescription filled elsewhere. This resolution is not meant to apply to institutional practice. Your reference committee recommends the adoption of this resolution.

Resolution in Appreciation of Dr. Louis H. Bauer

Dr. William A. Hyland, for the Michigan delegation, introduced the following resolution, which was adopted by a unanimous, rising vote.

Resolved: As its distinguished President Dr. Louis H. Bauer concludes his term of office the American Medical Association expresses to him the deep appreciation of its officers and members for his inspired leadership, devoted service, and wise counsel. They extend to him as well their great thanks the best wishes for many more years of satisfaction which must come to him as a result of his unselfish and generous contributions in behalf of the medical profession.

Address of Commander of American Legion, Mr. Louis K. Gough

Dr. Louis H. Bauer, Past President, introduced Mr. Louis K. Gough, Commander of the American Legion, who addressed the House as follows:

Mr. President, Mr. Speaker, Distinguished Members of the House of Delegates and Distinguished Guests: I am informed that one of the questions before you is how to transact so much business in so little time, and, as my contribution, I am going to keep my remarks brief. As National Commander of the American Legion, I am honored and privileged this morning to represent the four million members of the American Legion and the Auxiliary before the leaders of the American Medical Association. There are many delegates among you and many more of your colleagues throughout the country who are also American Legionnaires. How many, I do not know. I am sincerely confident, however, that if this total were higher, it would be to the mutual benefit of both of our great organizations.

One of the goals common to both organizations was given eloquent expression by your immediate Past President, Dr. Bauer, here in New York at the time of the 34th National Convention of the American Legion last summer. Dr. Bauer was kind enough on that occasion to point out that, years before you decided to launch upon your own organized campaign against socialized medicine, the American Legion was already on record in opposition to any form of Government regimentation in the field of medicine. Now we understand that, so far as such commitments can be made, the present Administration has given your Association the assurance that there will be no support for a program of socialized medicine. As a veteran group high in the tradition of actions expressing our belief that the free institutions of America are worth fighting for, we are glad that the record shows our position in this matter arrived at early in the 1940's.

There is a second area in which we believe your interest should be as great as ours. That is the primary purpose for which the American Legion was organized, namely, veterans' rehabilitation. We have maintained, and the people through the Congress have acknowledged, that there is a clear obligation on the nation to care adequately for those citizens from whom war service has taken the ability to care for themselves adequately and properly.

The current actions of your Association give strong supporting evidence to our belief that the man who is called, or who volunteers for service, thereby has created a sense of obligation—of debt—owed by the people, through their government, to him who serves. Recognizing the sacrifice of the doctor who serves—and serves again—you have supported legislative efforts to gain special financial recognition for the doctor in uniform.

You know, of course, that the American Legion recognizes the part of the American Medical Association has played in bringing inspired medicine to the veterans of our wars. Here again the American doctor recognized the actions of the American Legion, in 1940 and 1941, in calling for a correction of the undistinguished medicine practiced in the Veterans

Administration prior to 1940. Since 1946 private medicine has performed the tasks that only its members could accomplish in supporting the improvements called for by the American Legion in Milwaukee in 1941. These joint efforts represented clear gain for everybody involved. The veteran, who is our primary concern, the profession, which is close to your hearts, and the taxpayer, who makes the service possible. As doctors, I am sure you agree that good medicine these days costs money and bad medicine is no bargain at any price. We believe that you are just as interested as we are in preserving and improving the high caliber of Veterans Administration care. We believe that you take exception as we do to any attempt, however well intentioned, to destroy the superior standards which have been established with your help for those who are deserving of help.

The American Legion is carefully watching the deliberations and action of Congress with reference to adequacy of funds for the Veterans Administration to carry out the programs for veterans assigned to it by Congress. Returning veterans' medicine to the political grabbag in the long run would solve nothing and save nothing. The veteran with entitlement who needs hospital care will continue to need it whether the Veterans Administration facilities are available to him or not. So far as I know, no one has suggested just where and how and by whom the neuropsychiatric, the tubercular, and the chronic cases are to be treated outside the veterans hospitals. No one knows better than you the overcrowded conditions of state and municipal institutions. To turn the deserving veteran out of Veterans Administration facilities would solve nothing and only create a new social problem.

There are those who want a change in the law authorizing hospital care of the non service-connected who are legally entitled on basis of inability to pay and availability of beds. We do not! We insist that only a selfish interest impels those who seek to abridge the basis for providing this medical care so positively established by the existing statute.

The American Legion, like the American Medical Association, is made up of citizens who pay taxes and who would like to see the federal budget balanced and the tax load lightened. We are for economy and efficiency in the government—most of all in the Veterans Administration, where those factors mean improved service for the deserving veteran. I think we have proved that over the years, and specifically during the current year by preparing and submitting to the Veterans Administration and the Congress seven separate recommendations for administrative savings in the agency that would save millions. I have discussed these proposed economy measures with the President, his reorganization staff, and several committees of the Congress, and have submitted them in writing to every member of Congress.

Much of the criticism being circulated about the program is based on erroneous or incomplete information directed at alleged abuses of the limitations on entitlement. We have found that charges of this character are usually based on erroneous or incomplete knowledge of the facts. It is a case of bad information running interference for good intentions. Accordingly, our National Convention of 1952 authorized the establishment of a special liaison committee to work with similar groups in the American Medical Association, the hospital and dental associations, and government agencies, to see if we could not come up with a set of agreed upon facts, acceptable to all concerned, as a means of common approach to the problem. The American Legion was privileged to arrange for the first of these fact-finding conferences last March in Washington. We had been led to believe that this was but the first of a series of meetings in which there could be a joint appraisal of the facts. We recognized that however accurate such a set of facts might be, their value was limited to the extent of their acceptance by all concerned—the public, the Congress, the doctor, the veteran, and the Veterans Administration.

Meanwhile, in line with the conferees' thinking, we are proceeding with our own surveys of certain aspects of the Veterans Administration operation. So far as our surveys have been developed, we yesterday submitted them for your consideration. It is our belief that such surveys, the only such information available, indicate a high observance of the rules

for eligibility for treatment under Veterans Administration authority. They are factual and not stacked. We would be delighted to have the American Medical Association participate in the work of preparing such surveys.

The American Legion field staff of rehabilitation experts to date has looked into the conditions surrounding the admission of patients to ten different Veterans Administration hospitals. Bedside checks of those actually in the hospital as non service-connected cases show that the great majority of these men had spent their savings, had lost the capacity to earn a living, and were incapable of paying for private hospitalization. Indeed, a goodly percentage of them had had their Veterans Administration application forms signed by their private physicians. Our surveys, as well as Veterans Administration surveys, indicate the number of short term non service-connected is less than 10 per cent, and of all patients in Veterans Administration hospitals it is indicated there is a negligible percentage whose entitlement under the law may be questioned. And it has not been clearly demonstrated that all of the negligible percentage are guilty of abusing this veterans privilege. We have taken aggressive steps to eliminate even a small percentage of abuse of entitlement which keeps needed beds from deserving veterans, and we will continue to do so. I will not take your time to enumerate what has been done and will be done along this line. Practicing physicians can be of great help in this Legion effort.

The American Legion has maintained the closest possible contact with the veterans medical and hospital system for 35 years. We have developed experience in this field, but we do not know all the answers. That is the reason we have been so anxious to get these facts, to analyze them properly, and to secure their acceptance.

Through such a joint effort, we believe you could bring your resources to the establishment of a Veterans Administration medical and hospital program operated as a stabilized effort, in an area of respect, confidence, and trust. In short, we seek a return to the kind of thinking and action which first inspired our nation to provide for the physical and mental rehabilitation of the veteran who is sick, broke, and has no place other than the Veterans Administration to go. We believe the answer to our mutual problems lies in developing a groundwork of factual information which is not only accurate but known and acceptable to all concerned, and in properly applying those facts to the problems of veterans' rehabilitation.

It has been an honor to appear before you.

Introduction of 26 Millionth Subscriber to Blue Shield Plans

The privilege of the floor was granted to Dr. Robert L. Novy, Michigan, who introduced to the *House of Delegates* Mr. William P. Marcum, Louisville, Ky., as the 26 millionth subscriber to Blue Shield Plans. Mr. Marcum expressed his thanks for the recognition accorded him, and his appreciation of the opportunity to become enrolled in Blue Shield.

Invitations for 1956 Annual Meeting from New York and Chicago

Dr. John J. Masterson, New York, presented an invitation on behalf of the Medical Society of the State of New York to the American Medical Association to return to New York for its annual meeting in 1956. The invitation was predicated on the possibility that New York will have its new coliseum completed in time, and the House of Delegates was petitioned to delay its decision on the 1956 place of meeting and delegate authority to the Board of Trustees, since by Fall of this year it should be known definitely whether or not the new coliseum will be completed in time.

Dr. Harlan English, Illinois, extended for the Illinois State Medical Society and the Chicago Medical Society an invitation to the American Medical Association to hold its annual meet-

ing in Chicago in 1956, anticipating that by that time there would be a new convention hall with adequate facilities.

The Speaker announced that both invitations would be referred to the Board of Trustees for recommendation.

Supplementary Report of Board of Trustees on Place of 1956 Annual Meeting

Dr. Dwight H. Murray, Chairman, presented the following supplementary report, and the Board of Trustees was granted the authority therein requested.

Three invitations have been received by the Board of Trustees for the 1956 Annual Meeting of the Association. Two of the invitations have just been received. The other is from a city where it is believed the accommodations for exhibits are inadequate. The Board, therefore, requests authority from the House of Delegates to select the meeting place for the 1956 Annual Meeting at some time in the near future and to report back to the House in December, 1953.

Address of Past President Frank H. Lahey on National Fund for Medical Education

The Speaker requested the privilege of the floor, which was granted, for Dr. Frank H. Lahey, Past President of the Association, who addressed the House as follows:

Mr. Speaker, Members of the House: I am compelled to come here and speak to you on this subject because I want to bring to those of you who are interested in the future of medical education an encouragement that to me is very stimulating. I have been a trustee of the National Fund for Medical Education now for two or three years. I have become interested in it. I have come to know the men behind it. I have traveled over the country with it, and I know enough about it and what it is doing so that I feel able to bring you some information concerning what is going on in it, what the future offers for it, and what the possibilities in the way of aiding the yearly deficit of medical schools are.

First of all, I must be extremely careful that you do not think I am interjecting myself into your program of contributions from doctors. That should and will remain in your hands, but my interest is to be an individual, if you please, who perhaps links your efforts with the efforts of the National Fund for Medical Education, dealing particularly with industry and industrialists. Why should I interest myself in this project? Mrs. Lahey says it is because I don't know any better, but actually it is possible, it seems to me, to do something for medical education in this capacity which will be helpful. Dr. Henderson and his group handle the contributions from the medical profession, which have been tremendously encouraging to present to industry. But let me at least be one of the professional group who is in contact with those officers of the National Fund for Medical Education who can go out with them and present to industry our viewpoints and our knowledge of what the actual situation is.

You have, as I am sure you all know, in the three previous years, upped your contributions in one form or another from around half a million to around 750 thousand dollars. I have Jerry Ade here who lives with this problem and represents the office, and he tells me that the contributions are now in the neighborhood this year of a million and a half. If you include in your contributions those to the medical schools of which you are graduates, this now runs in the neighborhood of 3 million dollars. This, I believe, is an answer to any questions which we may meet as we travel over the country—why don't the doctors do it themselves? Actually the doctors have outdone industry. I don't believe in the long run they will, but I would like perhaps to give you some information which shows what industry is really doing, and I would like to pay tribute to those men in industry who have participated in this. I refer to such men as President Hoover, President Hoover's willingness to take part in this, to stay up nights and talk to groups, has been tremendously stimulating to me. Sloan Colt, the

president of one of the large banks in this city, has been traveling the country. There is Colby Chester, Chairman of the Board of General Foods, who has shown a deep interest in traveling all over the country addressing organizations. He has used all of his contacts with the National Association of Manufacturers, of which he is a member, and I think a past president, to encourage their interest in this problem.

We are making headway in interesting industry in the roughly ten million dollars a year deficit the medical schools run. I should like to say to you also that it won't be long before we shall have more accurate figures as to what the real deficit is, because we are now in the process of trying to accumulate that information. The committees that have been working on this have found that industry knows little about what this project is. In meetings in Denver, Philadelphia, Chicago, and various other places, I find that industry has a very cloudy idea of what this project is. They satisfy themselves with the idea that they contribute to their local hospitals and their local research problems, but they are not aware that it is the purpose of this organization to inform them that this project is of deeper significance than the maintenance of local hospitals, and we would not want to hurt them or the Red Cross. Without the production of doctors, without the free enterprise in the training of medical students, the Heart Fund, Red Cross, Polio, local hospitals, all, are in serious danger of state control, against which you have worked so successfully.

We recognize that we have a good Administration, but we are not sure what the coming administrations may be. We know also that once we let this go and it gets into the hands of government, it is very likely that we will never recover it, because such has been the history of all projects which have gone into the hands of government. In addition to that, you get into the position of letting government do it if they will, and that is an important psychological factor. When we went to Denver, as we did, we went away all convinced that these industrialists became aware of what the real situation is, that they became interested in it and enthusiastic in developing committees in their communities. They, I believe, will be able to provide more and more each year.

It will be of interest, from these figures with which Mr. Ade has provided me, to note that there is an increase over 1952 for the first five months of this year, that the amount of gifts is 64 per cent ahead of last year, and that the number of gifts is 175 per cent ahead of last year. The renewal rate last year was 73 per cent, and this year it is practically 100 per cent. The number of gifts is more in the first five months by 340 this year than was available in the whole of last year.

I want to give you just some idea of what these men do so altruistically. Juan Trippe, for instance, provides this group with a private plane from Pan American with two pilots that transport them over the country—New York City, Chicago, Denver, Des Moines, Detroit, St. Louis, Cleveland, Pittsburgh, Philadelphia, and New York City again, that is where they went last year. These committees are set up with chairmen for groups, such as furniture, plumbing, steel, brewers, and so on. It is extremely encouraging to me to see how practically and how well this project has been organized. We find that television and radio stations throughout the country are cooperating, and that literally thousands of people are being informed on this subject. There has been front page publicity in the newspapers, there have been all kinds of radio communications and programs. Another impressive thing has been the willingness of President Eisenhower to commit himself, over his own signature, in a letter to the effect that this project must go forward.

I have felt that the Clinic should make a donation to this fund, and it is so close to my heart that I told Jerry Ade this morning that I didn't want him to feel we had lost interest, but our contribution should be, we believe, as yours should be, through medicine, and we want you to know that a real effort and a sound one is being organized to get business to participate.

Colby Chester has said something to business which is so true, and it will come to be effective, and that is that business has been in jail over the past years, and he has said to business, "You must realize that you must do more than give away five-eighths of one per cent of the 5 per cent that you are permitted to give, and that this is one of the gifts that will pay you in industry a very high reward." They are becoming more and more conscious of it, and we feel that if you will go on and set the example that you have in the way of contributions for this project, we can encourage the businessmen to do as much and preserve medicine from that fate which none of us wants to see come about, and that is government dominance.

Thank you very much for the opportunity of presenting this subject to you.

Resolution on Expression of Appreciation to Physicians of Korea

Dr. Robert L. Novy, Michigan, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations.

WHEREAS Our valiant allies the people of Korea have suffered incalculably since the invasion of the Republic of Korea by the Communist North Korean People's Republic, and

WHEREAS the individual physicians of the Korean Medical Association a member of the World Medical Association have shown great courage and personal sacrifice against almost insurmountable odds in meeting the medical needs of their people, therefore be it

Resolved That the House of Delegates of the American Medical Association in session in New York on June 3, 1953 express to the physicians of Korea and the Korean Medical Association our deep and sincere appreciation and admiration for their personal courage and devotion to their nation and their fulfillment of the highest traditions of the medical profession and our firm intention to aid our colleagues, the physicians of Korea both in substance and in spirit.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. George S. Klump, Chairman, submitted the following report, which was adopted.

The resolution introduced by Dr. Robert L. Novy expressing appreciation of the American Medical Association to physicians of Korea is heartily endorsed by your committee. It is suggested that the sentiments expressed might well be transmitted through Ambassador Yang, who is a Doctor of Medicine.

Resolutions on Dr. Donald G. Anderson

Dr. Herbert B. Wright, Ohio, introduced the following resolutions, which were adopted by a unanimous, rising vote.

WHEREAS Dr. Ronald G. Anderson is terminating his position as Secretary of the Council on Medical Education and Hospitals to assume the office of Dean of the Medical School of the University of Rochester New York, and

WHEREAS For more than seven years Dr. Anderson has efficiently and effectively carried out the duties of his office of Secretary to the Council, and

WHEREAS He has set an example by his integrity, capacity, and efficiency and has won the regard of this House, therefore be it

Resolved That this House by adopting these resolutions hereby express its sense of loss of the services of an able man and be it further

Resolved That this House herewith express its sincere best wishes for every success for Dr. Anderson in his new endeavor and be it further

Resolved That after being spread on the minutes of this the annual session of the House of Delegates of the American Medical Association, suitable copies of it be made and forwarded to Dr. Anderson and to Dr. DeKiewit, President of the University of Rochester.

Resolution on Crippled Children's Programs

Dr. Cleon A. Nafe, Indiana, introduced the following resolution, which was referred to the Reference Committee on Hygiene and Public Health.

WHEREAS Section 200.9 of Part 12-4 of Regulations for Maternal and Child Health and Crippled Children's Programs, entitled Crippled Children's Program, Diagnostic Services states as follows: State

Plans for Crippled Children's Services shall provide that the diagnostic services under the plan will be made available within the area served by each diagnostic center to any child (a) without charge (b) without restriction or requirement as to the economic status of such child's family or relatives or their legal residence and (c) without any requirement for the referral of such child by any individual or agency', therefore be it

Resolved That the Board of Trustees work through whatever channels may be necessary to eliminate this section of the Regulations the same being a socialistic regulation

Report of Reference Committee on Hygiene and Public Health

Dr Everett P Coleman, Chairman, submitted the following report, which was adopted

Resolution on Crippled Children's Programs This resolution is required because of the fact that bureaucratic regulations from the Children's Bureau require that no Means test be used and that a state which does not submit to these requirements can have no funds allocated to it Your committee recommends the adoption of this resolution

Resolution on Remarks of Commander of American Legion

Dr Richard L. Meiling, Ohio, introduced the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS Mr Gough stated Recognizing the sacrifice of the doctor who serves—and serves again—you have supported legislative efforts to gain special financial recognition for the doctor in uniform is not correct in fact nor in its implication as to the medical profession's motives or to the motives of the physicians in uniform versus the so-called 'benefits' for veterans in general and

WHEREAS The history of legislative action with reference to the incentive or equalization pay for physicians dentists and veterinarians of the U S Public Health Service and the Armed Forces was proposed in 1947 to aid in the procurement of health professional officers for the regular corps—to wit that physicians and dentists in federal service who paid from personal funds for both their undergraduate and postgraduate education there be equalized the benefits provided the regulars of the line who received their education at West Point or Annapolis at the expense of the government therefore be it

Resolved That the House of Delegates now in session protest the implied slur on the patriotism and motives of physicians serving in the uniform of the Armed Forces and the U S Public Health Service as implied by Mr Gough and that the Editor of The Journal of the American Medical Association make public the true facts concerning equalization pay for physicians dentists and veterinarians serving in the Armed Forces and the U S Public Health Service

Report of Reference Committee on Legislation and Public Relations

Dr George S Klump, Chairman, presented the following report, which, after discussion, was adopted

The resolution introduced by Dr Richard L. Meiling has been withdrawn after proper consultation with the sponsors and with their consent Your reference committee offers the following substitute resolution

Resolved That the Editor of The Journal of the American Medical Association make public the true facts concerning equalization pay for physicians dentists and veterinarians serving in the Armed Forces and the U S Public Health Service

Gift of Woman's Auxiliary to American Medical Education Foundation

Dr Elmer L. Henderson, Past President, announced that the President of the Woman's Auxiliary, Mrs. Ralph B. Tusden, had presented him with a check of \$10,000, for the American Medical Education Foundation, that this is the third year in succession that the Auxiliary has contributed this amount and that in addition a state committee of the Auxiliary has raised \$21,500 which has been turned over to the Foundation

World Medical Association

As Chairman of the United States Committee of the World Medical Association, Dr Elmer L. Henderson announced that application blanks for membership in the United States Com-

mittee were available at this meeting of the House and appealed to the delegates to support the World Medical Association by becoming members of the United States Committee

Death of Dr Leshe S Kent

The Speaker read a telegram announcing the death of Dr Leshe S. Kent, Eugene, Ore., the first woman physician to serve as President of the Oregon State Medical Society and a former alternate delegate to the American Medical Association

The House rose in silent tribute to Dr Kent.

Expression of Appreciation

Dr Hollis E. Johnson, Chairman of the Reference Committee on Rules and Order of Business, presented the following motion, which was duly seconded and adopted

The Reference Committee on Rules and Order of Business wishes to move that we express our appreciation to Mr O'Brien of the G D Searle Company for a delightful social hour at luncheon and that we request Mr O'Brien to transmit our thanks and appreciation to Mr Searle who was not able to attend this meeting because of the marriage of his daughter in Chicago We thank him for this delightful occasion and we convey our best wishes to the bride and groom

Election of Officers

The following officers were elected

President Elect Dr Walter B. Martin Norfolk, Va
Vice President Dr Carl H. Gellenthien Valmora N. Mex.
Secretary Dr George F. Lull Chicago
Treasurer Dr J. J. Moore Chicago
Speaker House of Delegates Dr James R. Reuling Bayside N. Y.
Vice Speaker House of Delegates Dr E. Vincent Askey Los Angeles
Members Board of Trustees Dr Edwin S. Hamilton Kankakee Ill.
Dr Gunnar Gundersen La Crosse Wis. Dr Julian P. Price Florence S. C.

Drs Hamilton and Gundersen were elected to succeed themselves, and Dr Price was elected to fill the unexpired term of Dr Walter B. Martin

Member Judicial Council Dr George A. Woodhouse Pleasant Hill Ohio

Members Council on Scientific Assembly Dr Henry R. Viets Boston Dr Charles H. Philfer Chicago

Members Council on Medical Education and Hospitals Dr Victor Johnson Rochester Minn. Dr Leland S. McKittrick Boston

Members Council on Medical Service Dr Louis M. Orr II Orlando Fla. Dr Robert B. Homan Jr., El Paso Texas

Member Council on Constitution and By-Laws Dr Stanley H. Osborn Hartford Conn.

Election of Affiliate Members

On nomination by the Judicial Council

Dr Jon H. Rouch Oubangul-Charl French Equatorial Africa
Dr Bernarr B. Johnson Addis Ababa Ethiopia
Dr Edward M. Morgenstern Mexico City Mexico

On nomination by the Section on Experimental Medicine and Therapeutics

F. Royce Franzoni Arlington Va.
Kalman I. Perlman Chicago

Motions of Appreciation

Dr Hollis E. Johnson, Chairman of the Reference Committee on Rules and Order of Business, presented the following report and motions, which were adopted individually

Mr Speaker and Members of the House of Delegates of the American Medical Association Your Reference Committee on Rules and Order of Business, acting for the House of Delegates, wishes to make some brief motions expressing commendation and appreciation to the various Councils, Committees, persons and organizations whose untiring and unselfish

efforts have contributed so much toward making this, the 102d Annual Meeting of our Association, such a wonderful success¹

1 Your reference committee moves that a sincere vote of thanks and appreciation be extended to the Local Committee on Arrangements, under the able chairmanship of Dr J Stanley Kenney, for the very efficient plans of this gigantic meeting which have helped so much in the orderly and frictionless operation of its procedures

2 To the Subcommittee on Delegates' dinner under the chairmanship of Dr William B Rawls Mere words cannot do justice to the evening of wonderful entertainment afforded us by the New York doctors

3 To the Secretary's Office and staff, under the capable direction of Mrs Cascio, whose untiring efforts through long, weary hours have contributed so much to the success of this meeting,¹ and to the public relations bureau and staff of the headquarters office

4 To the management and all the staff of the Waldorf-Astoria Hotel for the excellent preparations made for the meeting of this House of Delegates and the other activities of our medical organization and for the efficient execution thereof

5 To the Convention Bureau of New York City and all the other hotels of this city that have helped in any way to make this meeting so successful

6 To the following television and radio networks for their excellent coverage of the activities of our Association CBS TV, NBC-TV, United Press Movie Tone TV, WABC-TV, All Star News and WOR-TV, and the following radio networks ABC, CBS, and NBC, and further to the various radio stations in New York City which made several broad casts of the activities of our Association daily, and to the newspapers of New York City for their excellent coverage of our activities

7 To Jean Hersholt for his sympathetic interpretation of The Family Doctor, to his company of players and the Chesebrough Manufacturing Company for making this production possible

8 To the various Councils and Reference Committees of this House of Delegates for their diligent studies of the many resolutions that passed through their hands

9 To the scientific sections for their excellent programs and to all the exhibitors, both scientific and commercial, for their valuable contributions to the success of this meeting

10 To the Doctors' Orchestral Society of New York for the program of music presented for the Presidential Inauguration

11 Last, but far from least, to the Speaker and Vice Speaker of the House of Delegates for their usual fair and judicious handling of the proceedings of the House.

Motion of Appreciation to Dr Elmer L Henderson

Dr Paul A Davis, Section on General Practice, moved that the House of Delegates express its appreciation for the wonderful work done by the Past President, Dr Elmer L Henderson, as Chairman of the American Medical Education Foundation

The motion was duly seconded and adopted by a rising vote

Introduction and Remarks of Mrs. Ivy Baker Priest, Treasurer of the United States

Dr George M Fister, Utah, received the privilege of the floor to introduce Mrs Ivy Baker Priest of Utah, Treasurer of the United States, who addressed the House as follows

¹ Mrs Bess McDonald Spies Miss Mary McGovern Miss Juellina Williams Mrs Mary DeStefano Miss Hazel Hopkins Miss Eleanor Sirio and Mrs Ida May Cascio were introduced and received the plaudits of the House

Mr Chairman and Distinguished Doctors I am delighted to be here I was greatly surprised to find myself designated for this position I am delighted to have it, very proud to have it, very proud to be part of this Administration I realize that this Administration has a very difficult role in the next four years, a role that it must meet fearlessly and courageously, because the job that must be done for the good of this country is not easy It is very difficult, and it will require patience, understanding, and support from the peoples of these United States everywhere It can't be done overnight, and very definitely it is going to require a great deal of courage, perseverance, understanding, and, above all, deliberation, for a sound basis upon which to build for the future You see, the course that must be followed is not popular, very unpopular, as a matter of fact, but for the good of this country it must be done And so I am very proud to be part of this Administration

As Treasurer of the United States, I have no policy making powers I can't say how the money shall be spent I just spend it according to the way I am directed by Congress and by the Treasury Department But I do know this, that a very real effort on the part of those who are making policy in this Administration will be put forth to see to it that we do present a program that will have a sound basis upon which this country can grow We may be hurt a little, we will be hurt a little I think we expect that. But far better to be hurt a little in an orderly readjustment to a sound base from which we can build than to have had a complete collapse which might very well have happened, and financial collapse would certainly have been chaotic, not only for this country but for the world

And so my few words would just be to help this Administration, and your forbearance, your understanding, your patience, and your forbearance, and I am sure that every effort will be put forth by those in charge during these next four years to do a job for America

Address of President Elect Walter B Martin

The newly elected President Elect, Dr Walter B Martin was brought to the platform, and addressed the House as follows

Mr Speaker, Members of the House of Delegates You have conferred on me a great honor You have placed on me an equally great responsibility I wish to express to you my deep appreciation for the confidence that you have shown in me by so doing After twenty years in the House of Delegates, on the Council on Medical Service and the Board of Trustees, it stirs my soul and lifts my heart to know that my friends and associates have that much regard for me I would be bold indeed in accepting this responsibility were I not moved by some sense of misgiving as to my ability to measure up to the high requirements of this great office You have been most fortunate in the caliber of men who have served you in the past in this position, and I hope that I can follow their leadership and bring to the American Medical Association the accomplishments in some measure that they have

I can give you one assurance, however, and that is a complete devotion to American medicine, its aims, its purposes, its ideals To accomplish these purposes, I know I can rely on you and all our associates here in bringing effective support to anything that I do I am persuaded that the policies laid down by this House have been sound policies, and that our cause is just, that in our labors here together we are working not for economic gains for ourselves, but to serve the cause of all the people, just as you as individual doctors serve your own patients for their best interests To the end that our purposes may be accomplished and our policies continued, I pledge to you the full measure of my strength, physically, bodily, and mentally I want to thank you individually and as the representative body of the American Medical Association for this great honor, and I accept the responsibility

The House adjourned sine die at 3 05 p m., Thursday, June 4

MEDICAL NEWS

ALABAMA

Medical Officer Needed—The headquarters of the Mobile Air Materiel Area, Brookley Air Force Base, is seeking a medical officer (male or female, with experience in occupational medicine) to serve as civilian chief of the civilian dispensary at an entrance salary of \$7,040 a year. This officer will be in charge of the industrial medical program for civilian employees, give emergency treatment to personnel injured on the reservation, prepare reports of examinations, determine type of work for which personnel are physically qualified, and exercise professional supervision over nurses, laboratory technicians, and clerical personnel. Applicants must have had at least one year of responsible professional experience. One year of an approved residency may be accepted for this one year of required experience, but the internship may not be included. Postgraduate experience as a teacher in this field in an approved school of medicine may be accepted toward meeting the experience requirements. Applicants should submit completed form 57 to Employment Unit, Building S 153, Brookley Air Force Base, Alabama. Application forms may be secured at the nearest post office or from Mr. W. N. Ballard, Chief, Civilian Personnel Branch, Brookley Air Force Base, Alabama.

ARKANSAS

University News—The Arkansas General Assembly recently took action that assures the completion of the University of Arkansas Medical Center in Little Rock at a total cost of about

Proposed University of Arkansas Medical Center

13 million dollars. The first unit in the center, a 450 bed teaching hospital and clinic, now under construction, is expected to be completed in the fall of 1954. The recent legislative action makes possible the construction and equipping of a building to house the school of medicine, the school of pharmacy, and a newly established collegiate school of nursing, as well as a women's dormitory to house students in the school of nursing and other women students. The entire medical center is expected to be ready for occupancy in 1955.

Personal—Dr. Leslie H. Wright, manager of the VA Hospital in Fayetteville, was recently elected chairman of the Fayetteville Community Chest.—Dr. Richard W. Miller, Fayetteville, has been appointed chief of staff of the Washington County Hospital, Fayetteville.—Dr. Jabez F. Jackson, Newport, was recently named president of the Newport Rotary Club.—Dr. Lorenzo D. Massey, Osceola, was recently named man of the year by the Chamber of Commerce and was presented with a desk set. Dr. Massey, who has practiced in

Osceola for 30 years, is chairman of the South Mississippi County Medical Association, a member of the hospital committee of the Chamber of Commerce and of the board of the Mississippi County Hospitals, and president of the Osceola Kiwanis Club.

CALIFORNIA

Dr. Blumer Honored—At the annual meeting of the Connecticut State Medical Society in Hamden, Dr. George Blumer, San Marino, president of the Connecticut society in 1920-1921 and a member since 1907, was elected to honorary membership. Dr. Blumer was formerly professor and dean at the Yale University School of Medicine, New Haven, Conn.

Diabetic Camps—According to the *Los Angeles Diabetes Newsletter*, there are two camps for diabetic children in California. Uni-Betic Camp, sponsored by the nonprofit Los Angeles Metabolic Clinic and directed by Dr. William H. Grishaw, is held for two weeks only and is limited to 70 children, with more than half drawn from the clinic at Children's Hospital. Camp site (in the mountains above Redlands), counselors, and staff are "loaned" for the period by University Camp, an all summer project of the University Religious Conference, University of California at Los Angeles. Camp Whitaker, in the mountains above Fresno, near King's Canyon National Park, directed by Dr. Mary B. Olney of the University of California Medical School in San Francisco, is maintained for two 2-week periods each summer. For information write Dr. Olney at 1429-4th Ave., San Francisco 22. For information concerning the 16 other camps for diabetic children in the United States write Chairman, Committee on Camps, American Diabetes Association, 11 W. 42nd St., New York 36.

ILLINOIS

Society News—The Illinois Psychiatric Society has elected the following officers: president, Dr. Alfred P. Bay, Manteno; vice president, Dr. Harry H. Garner, Chicago; secretary-treasurer, Dr. Louis B. Shapiro, Chicago; and councilors, Drs. Jules H. Masserman and Helen V. McLean, Chicago.

Cancer Grants—The Illinois Division of the American Cancer Society has allocated \$57,560 for research in cancer. Dr. Samuel G. Taylor III, clinical associate professor of medicine, University of Illinois College of Medicine, Chicago, received the largest of nine grants (\$11,568) for study of the effects of hormones and various surgical procedures in carcinoma.

Appoint Director of Cleft Palate Institute—Dr. Frederick W. Merrifield, professor emeritus of surgery, Northwestern University Medical School, Chicago, has been appointed director of the Northwestern University Cleft Lip and Palate Institute. Dr. Merrifield, one of the founders of the institute, is a staff member of Passavant Memorial Hospital and Children's Memorial Hospital, and the Evanston Hospital Association. When the institute was established in 1946 \$25,000 was allocated to it from a grant for the rehabilitation of children with facial deformities. Research and education also are phases of the institute program.

Chicago

Dr. Huggins Wins Award—At the annual Symposium on Fundamental Cancer Research, sponsored by the University of Texas M. D. Anderson Hospital for Cancer Research, Houston, the Bertner Foundation award was bestowed on Dr. Charles B. Huggins, professor of surgery, University of Chicago School of Medicine, for his studies in controlling human cancer by physiological methods. Dr. Huggins delivered the annual Bertner lecture. His subject was "The Control of Human Cancer by Hormonal Methods."

Physicians are invited to send to this department items of news of general interest for example those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

Dr Richmond Goes to Syracuse—Dr Julius B Richmond, professor of pediatrics, the University of Illinois College of Medicine, and superintendent of the Institute for Juvenile Research, has been appointed professor of pediatrics at State University of New York College of Medicine at Syracuse. Dr Richmond will be the first full time professor of pediatrics on the college staff, succeeding Dr Tyree C Wyatt, who administered the department on a part-time basis and will continue as clinical professor of pediatrics. After an internship and residency in Chicago hospitals, Dr Richmond graduated from the U S School of Aviation Medicine and served as Chief Flight Surgeon, Army Air Force, Central Instructors School, Randolph Field, Texas. He was lecturer in communicable diseases at the Cook County School of Nursing, lecturer at the School of Social Welfare Administration, and lecturer in biology of human development at the Institute for Psychoanalysis in Chicago, and in 1948 was appointed a John and Mary R Markle Foundation Scholar in the Medical Sciences for a five year period. He was for three years co editor of the "Yearbook of Pediatrics."

MASSACHUSETTS

Grant for Geriatrics Study—A three year grant of \$112,688 has been received from the W K Kellogg Foundation of Battle Creek, Mich., to finance a program in geriatrics at the Harvard School of Public Health, Boston. Dr Hugh R Leavell, head, department of public health practice, will be chairman of the group.

Protein Foundation Formed—Gov Christian A Herter recently delivered to seven business and scientific leaders a charter for a new nonprofit corporation, Protein Foundation, Incorporated, which "will hold and administer patents covering discoveries of importance in the field of therapeutics and public health, arrange for research and development work to make available laboratory discoveries of use to the medical profession, and provide support for continuing basic scientific research." Trustees of the foundation are Chester I Barnard, D Sc, New York, chairman, former president of the Rockefeller Foundation and now chairman of the National Science Foundation, Mr James S Adams, New York, chairman, executive committee, American Cancer Society, Detlev W Bronk, Ph D, president of Johns Hopkins University, Baltimore, and of the National Academy of Sciences, Mr Paul Foster Clark, Boston, chairman, national advisory committee, American Heart Association, Wilbur K Jordan, Ph D, president, Radcliffe College, Cambridge, William M Rank, deputy director of the Mutual Security Agency, and James Norman White, A B, Boston, the investment firm of Scudder, Stevens and Clark. The foundation will hold all patents on inventions in the fields of medicine and public health that have resulted from work by Edwin J Cohn, Ph D, and his associates in the Harvard University Laboratory of Physical Chemistry Related to Medicine and Public Health, and by scientists who have collaborated with the laboratory. The foundation will administer such patents wholly in the public interest, following the policy of Harvard University, which requires that no patent shall be taken out by a member of the university in the field of therapeutics or public health unless it shall be made available in an appropriate manner for the public benefit, without profit to the inventor, the university, or the foundation. The technical advisers to the foundation, the Commission on Plasma Fractionation and Related Processes, under the chairmanship of Dr Cohn, include Dr G J Dalldorf, chief of laboratories, New York State Department of Health, Albany, J Enders, Ph D, associate professor of bacteriology and immunology, Harvard Medical School, and chief of the research division of infectious diseases, Children's Medical Center, Boston, Dr C A Janeway, Rotch Professor of Pediatrics, Harvard Medical School and physician-in-chief of Children's Hospital, Boston, Dr T D Jones, medical director, Helen Hay Whitney Foundation, New York, Dr R I Lee, Boston, member of the Harvard Corporation, Dr G Scatchard, Ph D, professor of physical chemistry, Massachusetts Institute of Technology, and Dr J Stokes Jr, Children's Hospital, Philadelphia.

MICHIGAN

Society News—The Michigan Society of Neurology and Psychiatry recently elected Dr Willard W Dickerson, Caro, president, Dr Orus R Yoder, Ypsilanti, president-elect, Dr Benjamin Jeffries, Detroit, secretary, and Dr Louis Koren, Eloise, treasurer.

Personal—An award for "distinguished service in medicine" has been presented by the Alumni Association of the University of Kansas, Lawrence, Kansas City, to Dr Elwood A Sharp, director of clinical investigation for Parke, Davis & Company, Detroit, since 1929. Before engaging in his research work in Detroit, Dr Sharp served 13 years in the medical corps of the United States Navy, attaining the rank of lieutenant commander. Dr Henry S M Uhl, Detroit, has accepted appointment as medical education director of the Worcester (Mass.) City Hospital. Dr Uhl, an attending staff member of the City of Detroit Receiving Hospital, was formerly affiliated with Johns Hopkins Hospital, Baltimore, Henry Ford Hospital, and Wayne University College of Medicine, Detroit, where he directed research projects in arteriosclerosis and conducted a seminar on ethics and religion in relation to the profession of medicine.

NEW YORK

University News—At the annual meeting of the New York State Hospital Medical Alumni Association, the following officers were elected: Dr Clarence P Oberndorf, New York, president, Dr Richard L. Frank, New York, vice-president, and Dr Samuel R Lehrman, New York, secretary-treasurer.

Clinic for Alcoholics—A daytime branch of the Rochester Clinic for Treatment of Alcoholism, which opened April 15 in Rochester General Hospital, with Dr Harold C Bonner as medical director, was made possible by a \$10,000 grant from the New York State Mental Health Commission. The new clinic, open every Wednesday from 9 a m to 5 p m, will more than double Rochester clinic facilities for alcoholics. According to Dr Ernest M Gruenberg, Syracuse, executive director of the Mental Health Commission, the \$10,000 grant from the commission is matched by contributions from General Hospital, the Health Bureau, and the Health Association of Rochester and Monroe County. The state grant is part of a \$100,000 fund appropriated to the Mental Health Commission last year for development of a clinic program for chronic alcoholics. Other grants have already been made to the University of Buffalo Information and Rehabilitation Center for Alcoholism and to Syracuse Dispensary, Inc., and a fourth grant is pending in New York City.

New York City

Otologists Honor Dr Lempert—The American Otological Society recently presented the 1953 award of merit gold medal "for outstanding achievement" to Dr Julius Lempert, together with an embossed resolution, stating "Your investigations, carried on through trials which would have discouraged a lesser figure, have so perfected the fenestration operation that your technique is accepted throughout the world, and regarded as a boon to mankind. Your remarkable studies, superior surgery and inspiring teaching mark you as the one who has made the greatest single contribution to otology in this generation."

Dr Meleney Goes to Louisiana—The retirement of Dr Henry E Meleney, Hermann M Biggs Professor of Preventive Medicine, New York University College of Medicine, his appointment as professor emeritus of the college, and his appointment to the faculty of Louisiana State University School of Medicine, New Orleans, as professor of research in medicine have been simultaneously announced. Dr Meleney, who has served on the medical faculty of New York University since April, 1941, has also been director of the preventive medicine service at the Medical Center's University Hospital and associate

visiting physician at Bellevue Hospital From 1920 to 1927 he was on the faculty of the Peking Union Medical College in China, and from 1927 to 1941 was associate professor of preventive medicine at Vanderbilt University School of Medicine in Nashville, Tenn. He served as visiting professor of public health at the American University of Beirut in 1949, and for the past two years has been a visiting lecturer at the Harvard School of Public Health. Dr. Meleney, a past president of the American Society of Tropical Medicine and of the American Society of Parasitologists, is currently president of the American Academy of Tropical Medicine.

NORTH CAROLINA

Course in Medical Mycology.—Duke University School of Medicine, Durham, announces a special summer course in medical mycology July 1-29 at the Mycology Laboratory, directed by Norman F. Conant, Ph.D. This is the seventh such course given at Duke since the establishment of its Fungus Registry in 1943, with the support of a grant from the American Foundation for Tropical Medicine.

OHIO

Society News.—At the annual meeting in Cincinnati the Ohio State Medical Association installed Dr. Paul A. Davis, Akron, as president and chose Dr. Merrill D. Prugh, Dayton, as president-elect. Dr. Richard L. Meiling, Columbus, will continue to serve as treasurer and Mr. C. S. Nelson as executive secretary. The 1954 annual meeting will be held in Columbus, April 13-15, and the 1955 annual meeting in Cincinnati, April 19-21.

Mission to Israel.—Dr. Milton Rosenbaum, professor of psychiatry at the University of Cincinnati College of Medicine, recently went to Israel to assist in the establishment of a new department of psychiatry at the Hebrew University-Hadassah Medical School. His special assignment was made possible by a grant of \$150,000 from the Julius and Marie Scheider Memorial Fund for Neuropsychiatry to the Hebrew University-Hadassah Medical School. The grant, covering a 10 year period, is specifically earmarked for psychiatric teaching and research, and for work in neurology. Dr. Rosenbaum, who will be in Israel between three and four months as visiting professor of psychiatry, will integrate the clinical resources of the Rothschild-Hadassah University Hospital and Outpatient Clinic, Lasker Mental Hygiene Clinic of Hadassah, Ezra's Mental Hospital, and the Talbich Psychiatric Hospital, into the teaching program of the new department.

OREGON

Narcotic Violation.—Dr. William Leroy Teutsch, 3011 S. W. Alice St., Portland, was convicted in the U. S. District Court at Portland of violating the federal narcotic law. On March 10 Dr. Teutsch was sentenced to serve a term of three years.

Dr. Swan Awarded Medal.—Dr. Kenneth C. Swan, head, department of ophthalmology at University of Oregon Medical School, Portland, was awarded the Proctor medal at the annual meeting in June of the Association for Research in Ophthalmology in New York. The Proctor medal, established in 1947 by Mrs. Francis I. Proctor in memory of her husband, a Boston ophthalmologist, has been awarded only three times previously. Dr. Swan won the award as the result of nearly 20 years of research on (1) drugs and their effects on diseases of the eye, (2) the basic physiology of ocular movements and abnormalities of coordination, and (3) the causes and prevention of blindness. He has been instrumental in setting up a state-wide ophthalmologic care program and a program for the prevention of blindness and the conservation of vision. As part of this program, he and Dr. Leonard Christensen, assistant professor of ophthalmology, are conducting, under a Kellogg Foundation grant, a three year survey in Oregon on causes of blindness.

PENNSYLVANIA

Dr. Harvey Smith Receives Cancer Award.—Dr. Harvey F. Smith, Harrisburg, has received the American Cancer Society's bronze medal and citation for "outstanding contributions" in the work of cancer control. Now in his 82nd year, Dr. Smith was one of the pioneers in cancer control work in Pennsylvania and a founder of the Wainwright Tumor Clinic program. He retired 10 years ago as chief of the surgical staff at the Harrisburg Hospital, but still is active in his professional career. A member of the first Commission on Cancer of the Medical Society of the State of Pennsylvania, he served continuously from the time of its formation in 1912 until 1933 and has subsequently been a member of the commission at various times.

Philadelphia

University News.—Dr. Russell S. Boles has been appointed professor of clinical medicine in the University of Pennsylvania School of Medicine.

Hospital Health Museum.—Philadelphia's new Lankenau Hospital, to be opened this year, will house a health museum, reportedly the first hospital health museum in the world. There will be permanent exhibits, including animated anatomy, supplemented by changing displays reflecting new advances in the health field. These will feature normal growth and development in relation to maternity, childhood, youth, maturity, and old age. The prevention of chronic and degenerative diseases will be part of the educational program. The museum and auditorium are made possible through a \$300,000 gift.

Personal.—Dr. Charles E. Price, medical director of Hahnemann Hospital since 1948, will leave June 30 to become medical director of the General Hospital of Fresno County, Fresno, Calif. Dr. Price was formerly assistant administrator, Montgomery Hospital, Norristown, Pa. —Dr. Russell S. Boles has been appointed a consultant to the National Cancer Institute, U. S. Public Health Service, Washington, D. C. —Dr. Harry E. Bacon, professor of proctology, Temple University School of Medicine, received the honorary degree of doctor of science from Ursinus College, Collegeville, June 1.

WEST VIRGINIA

Society News.—Dr. James K. Stewart, Wheeling, was recently elected president of the West Virginia Academy of Ophthalmology and Otolaryngology. Dr. Benjamin W. Bird, Princeton, was named president-elect and Dr. Henry C. Hays, Williamson, vice president. Dr. Frederick C. Reel, Charleston, was re-elected secretary-treasurer. The next annual meeting of the academy will be at the Greenbrier, White Sulphur Springs, May 27-29, 1954. —Fred J. Holter, Ph.D., Morgantown, graduate advisor in the School of Physical Education of West Virginia University, and health education consultant to the state department of health, has been elected chairman of the West Virginia Organizations' Council, a new organization composed of groups interested in health, welfare, rehabilitation, recreation, and allied fields. Dr. William H. Rheldaffer, Charleston, United Mine Workers medical administrator, was named secretary. The group plans to enlarge the organization to include between 40 and 50 official and voluntary state groups "engaged in or otherwise concerned with providing services related to the well being of the citizens of West Virginia."

WISCONSIN

Civil Defense Medical Teams.—A new manual for the personnel of mobile medical teams has been prepared and edited for the Office of Civil Defense by Warren H. Southworth, Dr. P.H., professor of health education at the University of Wisconsin-Madison. The manual contains information on the atomic bomb, state organization for civil defense, make up of mobile medical teams, emergency treatment of disaster casualties, control of radiological hazards, and defenses against biological and chemical warfare. It also supplies suggestions for medical team instruction. The appendix carries a bibliography of helpful publications for medical team instruction, and lists films and filmstrips for the same purpose.

GENERAL

Casselberry Award—A sum of money having accrued from the Casselberry Fund of the American Laryngological Association, a prize will be offered in 1954 for original investigation in the art and science of laryngology or rhinology. Materials must be in the hands of the secretary, Dr Harry P Schenck, 326 S 19th St, Philadelphia, before March 1, 1954.

Gift of Hormone Tablets to India—A gift of more than 7 million hormone tablets for free distribution in India through the Indian Medical Association has been made by White Laboratories, Inc, pharmaceutical manufacturers, Kenilworth, N J, which offered them to the World Medical Association for distribution in a part of the world where economic conditions prevent large numbers of the persons from obtaining such drugs.

Cerebral Palsy Award—The Research Advisory Board of United Cerebral Palsy invites nominations for the third annual United Cerebral Palsy Max Weinstein award (a plaque and \$1,000) for the outstanding recent scientific achievement in the field of cerebral palsy. Nomination, accompanied by a short supporting statement, should be sent before Sept. 15 to Dr Glidden L Brooks, Medical Director, United Cerebral Palsy, 50 W 57th St., New York 19.

Tri-State Medical Journal—This new journal is being published by the Tri-State Medical Association of the Carolinas and Virginia under the editorship of Dr Richard B Davis, Greensboro, N C. The editorial board consists of Drs Frank S Johns, William R Jordan, and Howard R Masters, Richmond, Va., Drs William M Nicholson and R Burke Sutt, Durham, N C., Dr Walter G H Pott, Greenville, N C., and Dr George R Wilkinson, Greenville, S C., and Drs Joseph I Waring and Robert Wilson Jr, Charleston, S C.

Pharmaceutical Association Sponsors Contest—The New York State Pharmaceutical Association announces a nationwide contest to discover an effective plan for eliminating the needless duplication and imitation of drug products. The contest, which closes Sept 30, is open to everyone and offers three prizes \$500, \$300, and \$200. All entries must be "practical in nature and not of a visionary character" and "legal in concept under existing federal and state laws or at least not require the enactment of new legislation of doubtful constitutionality," and must avoid anything that might suggest boycotting methods or procedures. Manuscripts, typed in triplicate, should be addressed as follows: Duplication, New York State Pharmaceutical Association, 117-119 E 69th St., New York 21.

Dermatological Meeting in Seattle—The Pacific Dermatologic Association will hold its annual meeting at the Olympic Hotel, Seattle, July 9-10. Dr Norman N Epstein, San Francisco, will deliver the presidential address on "The Role of Cholesterol Metabolism in Dermatology," Thursday at 9 a m, after which Dr Earl D Osborne, Buffalo, will speak on "Treatment of Cancer by the Dermatologist." Dr Osborne will also lead round table discussions on malignant cutaneous lesions Thursday at 10 20 a m, and industrial dermatoses at 3 p m. Other guest speakers will be Dr Robert S Pollack, San Francisco, (Surgical Treatment of Advanced Epithelial Tumors), Dr Lloyd M Farner, Seattle ('Rehabilitation in Industrial Dermatoses'), and Dr Thrift G Hanks, Seattle ('Industrial Dermatoses in the Aircraft Industry'). Dr Thomas B Fitzpatrick, Portland, Ore., will discuss melanomas during the morning session. A cocktail party and dinner for members and wives will be held at the Rainer Club at 6 30 p m. The clinical meeting Friday at the University of Washington will be followed by luncheon round table discussion groups, after which a histopathological seminar will be held.

Transplantation Bulletin—Plans are under way to issue a quarterly *Transplantation Bulletin* which will publish once yearly a list of all practicing physicians and research workers here and abroad who are interested in transplantation problems. The registry will cover the fields of plastic surgery,

endocrinology, cancer, genetics, immunology, and experimental morphology. The managing editors are Dr Herbert Conway, Cornell University Medical College, New York, Dr Ernst J Eichwald, University of Utah College of Medicine, Salt Lake City, and Nathan Kaliss, Ph D, Roscoe B Jackson Memorial Laboratory, Bar Harbor, Me. Dr Blair O Rogers, Columbia University College of Physicians and Surgeons, New York, is associate editor. The *Transplantation Bulletin* invites workers in medicine and biology interested in tissue transplantation to submit their names and fields of interest to Dr Ernst J Eichwald, University of Utah College of Medicine, Salt Lake City. A subscription fee of \$3 to cover the expenses of printing the bulletin and maintenance of the registry and bibliography will be payable after publication of the first issue of the bulletin, probably in August.

Prevalence of Poliomyelitis—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States, its territories, and possessions in the weeks ended as indicated:

Cancer Conference in Denver—The Rocky Mountain Cancer Conference will be held at the Shirley Savoy Hotel, Denver, July 8-9 under the sponsorship of the Colorado State Medical Society and the Colorado Division of the American Cancer Society. The address of welcome by Dr William A Liggett, Denver, president of the Colorado State Medical Society, will be followed by a symposium on hematuria (Dr T Leon Howard, Denver, presiding) in which Drs Ralph M Caulk, Washington, D C, John R McDonald, Rochester, Minn, Henry D Diamond, New York, and Rubin H Flocks, Iowa City, will participate. Dr Sam W Downing, Denver, will preside at the round table luncheon and Dr Claude D Bonham, Boulder, president-elect, Colorado State Medical Society, at the afternoon session. First individual presentations by guest speakers include the following subjects:

Cutaneous Manifestations of the So-Called Lymphoblastomas Francis W Lynch St Paul
Early Diagnosis of Premalignant and Malignant Lesions of the Colon John W Cline San Francisco
Cancer of the Cervix: Why the High Death Rate When Most Early Cases Are Curable? Willard M Allen St. Louis
Mechanism of Spread of Carcinoma of the Breast Cushman D Haagensen New York
Problem of Cervical Cancer as Viewed by a Radiotherapist Ralph M Caulk Washington D C
Treatment of Special Complications of Lymphomas and Leukemias Henry D Diamond New York
Treatment of Carcinoma of the Prostate Rubin H Flocks Iowa City
Carcinoma of the Thyroid John R McDonald Rochester Minn

An informal banquet at 7 p m for physicians and their guests will be preceded by a social hour in the Lincoln Room. Dr Lumir R Safarik, president, Denver Medical Society, will preside over the Thursday morning session, Dr Kenneth C Sawyer, Denver, over the afternoon session, and Dr John S Bouslog, Denver, president, Colorado Division, American Cancer Society, at the round table luncheon.

FOREIGN

Congress of Hippocratic Medicine—The International Congress of Hippocratic Medicine will conduct its Journées Médicales in Evian, France, Sept 3-6. Papers will be delivered on the relations between hippocratism and general pathology, constitutional medicine, hygiene and therapy, surgery, and sociology. Enrollment must be received before Aug 15. Information may be obtained from M Paul Maubert, Direction Cachat, Evian (Haute Savoie), France. Prof Pierre Delore, 13, rue Jarente, Lyon, is in charge of scientific communications.

Congress for the History of Science—The International Congress for the History of Science, of which Prof F S Bodenheimer, Hebrew University, Jerusalem, Israel, is president, will meet in Jerusalem during the first week of August under the auspices of the International Academy and the International Union for the History of Science. Among the physicians listed on the program for the section on medicine are Dr Chester N Frazier, Boston ("Medicine in the New Harmony of Robert Owen—1825-1827"), Dr Hyman I Goldstein, Camden, N J ("Errors of Priority Credit in Medicine"), and Dr Samuel M Dodel, Washington, D C ("History of Human Tocography").

China and Nepal to Participate in WHO Program—Pursuant to arrangements made by the World Health Assembly whereby China's annual contribution, amounting to not less than \$10,000, would be accepted for 1954, and payment equivalent to \$125,000 would be accepted on account of contributions in arrears, the Republic of China has announced resumption of active participation in the work of WHO. Nepal was accepted as the 80th full member of WHO at its meeting in Geneva. The program and budget committee of the assembly adopted an effective working budget of \$8,497,700 to finance the 1954 program of WHO. This amount represents an increase of \$12,605 over the 1953 budget but is \$49,502 under the recommendations made in January by the WHO Executive Board and the director-general Dr Brock Chisholm. "The effective working budget of the World Health Organization for 1954 will consist of assessments against the 70 active member states and 3 associate members plus casual income. The intangible assessments against 10 inactive members are currently omitted."

DEATHS

Fitz, Reginald * Boston, member of the Council on Medical Education and Hospitals of the American Medical Association for many years, died at his home in Brookline, Mass., May 27, aged 68. Dr. Fitz was born in Boston Feb. 28, 1885. He graduated from Harvard University, Cambridge, in 1906, and received his M.D. degree from Harvard Medical School in Boston in 1909. Early in his career he served on the staffs of the Massachusetts General Hospital in Boston, Peter Bent Brigham Hospital in Boston, Johns Hopkins Hospital in Baltimore, and the Hospital of the Rockefeller Institute for Medical Research in New York. During World War I he became a major in the medical corps of the American Expeditionary Forces at Base Hospital no. 5 in France. He was associated with the Mayo Clinic in Rochester, Minn., from 1920 to 1922. In 1914-1915 he was a fellow in physiology at Harvard, where from 1922 to 1936 he was associate professor of medicine, since 1936 lecturer in the history of medicine, since 1947 assistant dean, and since 1935 university marshal. In 1936 Dr. Fitz was appointed Wade Professor of Medicine at Boston University School of Medicine and director of the Evans Memorial, serving until 1940, when he became clinical associate at the Thorndike Memorial Laboratory. In the American Medical Association, he was secretary of the Section on Practice of Medicine from 1929 to 1932 and chairman in 1932-1933, member of its House of Delegates in 1935, 1936, and 1939, and member of the Council on Medical Education and Hospitals from 1928 to 1949. For many years he was a member of the National Board of Medical Examiners and the American Board of Internal Medicine, of which he was chairman from 1944 to 1946. He was a member of the board of regents of the American College of Physicians, serving as vice president in 1947-1948 and president in 1949-1950, past president and from 1930 to 1940 chairman of the committee on medical education diplomas, Massachusetts Medical Society, past president of the Suffolk District Medical Society, member of the Massachusetts Heart Association, American Society for Clinical Investigation, American Association for the History of Medicine, Boston Tuberculosis Association, of which he was past president, Medical Library Association, Special Library Association, American Academy of Arts and Sciences, and the Colonial Society of Massachusetts. He was a member of the board of honorary consultants to the Army Medical Library in Washington, D.C., a medical adviser to the Boston metropolitan chapter of the American Red Cross, and trustee and president of the Perkins Institute for the Blind, and trustee of the Brookline Public Library, Wellesley College, and Boston Medical Library, of which he was vice-president. From 1940 to 1947 he was chairman of the Selective Service medical advisory board in Boston. In 1943 he received the honorary degree of doctor of science from Western Reserve University in Cleveland and in 1947 the honorary degree of doctor of laws from Hahnemann Medical College, Philadelphia. Dr. Fitz was a member of the editorial board of the *Archives of Internal Medicine*.

Holmes, Will Wane * Logansport, Ind., born in Fairland, Ind., in 1888, Indiana University School of Medicine, Indianapolis, 1913, specialist certified by the American Board of Otolaryngology, member of the American Academy of Ophthalmology and Otolaryngology, past president of the 11th Indiana Council on District Medical Association, president-elect of the Indiana Academy of Ophthalmology and Otolaryngology, served during World Wars I and II, affiliated with St. Joseph Hospital and the Memorial Hospital, where he died April 28, aged 64, of myocardial infarction.

Fischer, Luther C * Atlanta, Ga., born in Senora, Ga., Aug. 18, 1871, Atlanta College of Physicians and Surgeons, 1899, at one time vice president of the Southeastern Surgical Congress, past president of the Georgia Hospital Association, in

1925 to stimulate interest in research and to improve medical writing, established the L. C. Fischer prizes to be awarded through the Fulton County Medical Society, co-founder and, since 1932, owner of the Crawford W. Long Memorial Hospital, of which he was president and treasurer, died April 29, aged 81, of cerebral hemorrhage.

Moore, Gertrude * Oakland, Calif., born in 1883, Oakland College of Medicine and Surgery, 1907, specialist certified by the American Board of Pathology, founding fellow of the College of American Pathologists, member of the American Society of Clinical Pathologists, served as secretary of the Alameda County Medical Association, consulting pathologist, East Oakland, Providence, and Highland Alameda County hospitals, for many years consulting pathologist for the county district attorney's office, died May 3, aged 69, of subacute bacterial endocarditis.

Barry, Jesse R * Picher, Okla., American Medical College, St. Louis, 1899, formerly practiced in Cartersville, where he served two terms as mayor, died in Miami April 28, aged 83.

Bennett, Joseph Hammond, Wadesboro, N.C., University of Maryland School of Medicine, Baltimore, 1894, died March 7, aged 82, of uremia.

Berman, Edward * Utica, N.Y., Marquette University School of Medicine, Milwaukee, 1926, on the staff of the Memorial Hospital, died April 14, aged 53, of a heart attack.

Bernstein, Abraham, Philadelphia, Jefferson Medical College of Philadelphia, 1917, died May 10, aged 60, of heart failure.

Bickelhaupt, Bertram Samuel, Greenwood Lake, N.Y., Columbia University College of Physicians and Surgeons, New York, 1906, on the honorary staff of St. Anthony's Hospital in Warwick, died in Union Hospital in New York April 15, aged 68, of carcinoma.

Binford, Nellie, Los Angeles, Northwestern University Woman's Medical School, Chicago, 1901, died April 27, aged 80.

Boone, Benjamin Edwards Jr * Elkton, Ky., Vanderbilt University School of Medicine, Nashville, Tenn., 1910, member of the American Academy of General Practice, secretary of Todd County Medical Society, member of the Elkton and Todd County school boards, county health officer, died in Jennie Stuart Hospital, Hopkinsville, April 9, aged 66, of hypertensive cardiovascular disease.

Cordes, Henry Boyleston * Frostproof, Fla., Emory University (Ga.) School of Medicine, 1915, died in Lake Wales, March 30, aged 65, of dissecting aneurysm of the abdominal aorta and arteriosclerosis.

Crockett, Horace Eugene, Indianapolis, Memphis (Tenn.) Hospital Medical College, 1899, died in St. Elizabeth Hospital, LaFayette, Ind., Feb. 27, aged 76, of gastrointestinal hemorrhage.

Crooks, Toney Taylor * Chicago, Rush Medical College, Chicago, 1923, served during World War I, on the staff of the Norwegian American Hospital, where he died May 9, aged 65, of carcinoma of the lung.

Dally, John Eugene * Indianapolis, St. Louis University School of Medicine, 1920, formerly practiced in Terre Haute, Ind., where he was health officer, police surgeon on the staff of St. Anthony's Hospital, and draft board medical examiner, served during World War I, affiliated with St. Vincent's Hospital, medical director of the Larue D. Carter Memorial Hospital, died April 20, aged 58, of coronary occlusion.

Daniels, Ralph Peabody * Toledo, Ohio, Rush Medical College, Chicago, 1899, on the staff of the Toledo Hospital, where he died April 19, aged 78, of acute coronary thrombosis.

Diamond, Joseph Solomon ✶ New York City, University and Bellevue Hospital Medical College, New York, 1906, specialist certified by the American Board of Internal Medicine, member of the National Gastroenterological Association and the Radiological Society of North America, past president of the Harlem Medical Association, on the staff of Sydenham Hospital died in Paris, France, April 29, aged 71, of coronary thrombosis

Didier, Frederick William ✶ Wheatland Calif, George Washington University School of Medicine, Washington, D C, 1904, formerly member of the state board of medical examiners, died recently, aged 79, of coronary occlusion

Eaves, Benjamin F ✶ Draketown, Ga, Atlanta Medical College, 1893, died in the Community Hospital, Villa Rica, April 1, aged 82, of diabetes mellitus

Engstrom, Fred Alonzo, Wanamingo, Minn, University of Minnesota College of Medicine and Surgery, Minneapolis, 1908, served during World War I died in the VA Hospital, St Cloud, April 8, aged 69, of lobar pneumonia

Filippo, La Faun Newton, Hodges, Ala, Medical College of Alabama, Mobile, 1904 died in Adrian, Mich, March 14, aged 72, of cerebral hemorrhage

Focht, Wilham Weinhold ✶ Lebanon, Pa, Jefferson Medical College of Philadelphia 1937, died suddenly, April 12, aged 41, of chronic myocardial degeneration

Foley, Fred Charles ✶ Newell, Iowa, Rush Medical College, Chicago, 1894, died in Mound Park Hospital, St Petersburg, Fla, March 4, aged 84, of influenza

Freeman, Thelma ✶ Birmingham, Mich, University of Michigan Medical School, Ann Arbor, 1924, served as president of the Blackwell branch of the American Medical Women's Association, for many years affiliated with the Woman's Hospital in Detroit, where she died March 23, aged 60, of cerebral hemorrhage

Futch, Thomas Allen Jr ✶ Thomasville, Ga, University of Georgia School of Medicine, Augusta, 1935, served during World War II, died March 20, aged 43

Gaumer, Herman Elmer ✶ Wilmington, Del, Hahnemann Medical College and Hospital of Philadelphia, 1936, served in the European theater of operations during World War II, affiliated with Delaware, Memorial, St Francis, and Wilmington General hospitals, died April 4, aged 42, of coronary occlusion

Gibbon, Robert Lardner, Charlotte, N C, Jefferson Medical College of Philadelphia, 1888, past president of the Mecklenburg County Medical Society, member of the founders group of the American Board of Surgery, affiliated with Mercy Hospital, Memorial Hospital, and Presbyterian Hospital, where he died March 27, aged 86, of congestive heart failure

Hannah, Ward ✶ Long Beach, Calif, Northwestern University Medical School, Chicago, 1911, served during World War I, affiliated with Seaside and Community hospitals, died March 22, aged 73

Harrington, George Leonard ✶ Kansas City, Mo, University of Kansas School of Medicine, Kansas City, Kan, 1908, associate professor of psychiatry and neurology at his alma mater, specialist certified by the American Board of Psychiatry and Neurology, member of the American Psychoanalytic Association and the American Psychiatric Association, on the staff of the University of Kansas Medical Center, Kansas City, Kan, died in Independence April 12, aged 67, of coronary thrombosis

Higa, James Tosuke, Chicago, College of Medical Evangelists, Loma Linda and Los Angeles, 1943, affiliated with Alexian Brothers Hospital, Cuneo Hospital, and the American Hospital, where he died April 29, aged 41, of cerebral hemorrhage

Humphreys, George Hoppin ✶ Jamaica, N Y, Columbia University College of Physicians and Surgeons, New York, 1908, an Associate Fellow of the American Medical Association retired health director of the public schools of Jamaica, on the staff of the Jamaica Hospital, died April 16, aged 76, of arteriosclerosis

Irvin, Isham Willard, Albany, Ga, Atlanta Medical College, 1914 served during World War I, died in Phoebe Putney Memorial Hospital April 25, aged 61, of acute myocardial infarction

Ivanoff, Stephen ✶ Stony Point, N Y, Long Island College of Medicine, Brooklyn, 1933, on the staff of the Nyack (N Y) Hospital, died March 20, aged 47, of rheumatic heart disease

Ives, Washington Mackey, Lake City, Fla, Vanderbilt University School of Medicine, Nashville, Tenn, 1901 past president of the Columbia County Medical Society, veteran of the Spanish American War, served on the staff of the Lake Shore Hospital, died March 30, aged 75, of a heart attack

Jones, Charles James ✶ Philadelphia, University of Pennsylvania Department of Medicine, Philadelphia, 1889, affiliated with St Joseph's, Lankenau, Wills, St Vincent's and German town hospitals, received an honorary LL.D degree from Villanova (Pa) College, died April 15, aged 86, of heart disease

Kimbrell, Earl Dewey ✶ Chicago, Northwestern University Medical School, Chicago, 1931, served with the Indian Service, died April 27, aged 52, of coronary occlusion

McComb, Fred Jackson, Wichita, Kan, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1907, died in Wesley Hospital March 14, aged 74, of coronary thrombosis

McGuire, John P ✶ Clarksburg, W Va, University of Maryland School of Medicine, Baltimore, 1905, on the staff of St Mary's Hospital, died April 17, aged 79, of a heart attack

Mitchell, Edwin Waterman, Cincinnati, Medical College of Ohio, Cincinnati, 1882, professor emeritus of clinical medicine at University of Cincinnati College of Medicine, past president of the Cincinnati Academy of Medicine, for many years on the staff of the Cincinnati General Hospital and Christ Hospital, where he died April 20, aged 98

Parsons, Alfred Harrison ✶ Sayville, N Y, Long Island College Hospital, Brooklyn, 1905, an Associate Fellow of the American Medical Association, served during World War I, during World War II a member of the draft board in Great Neck, where he was for many years a school physician, at one time a director of the Nassau Hospital in Mineola, died May 3, aged 75, of cerebral hemorrhage

Picken, Mary Eleanor Stephenson, Orient, N Y, Woman's Medical College of Pennsylvania, Philadelphia, 1904, died in the Eastern Long Island Hospital, Greenport, Feb 23, aged 81, of arteriosclerosis and fracture of the left humerus

Plowitz, Paul Egon ✶ Elmira, N Y, Deutsche Universität Medizinische Fakultät, Prague, Austria, 1910, supervising psychiatrist at the Elmira Reformatory, affiliated with St Joseph's Hospital and Arnot Ogden Hospital, where he died March 8, aged 63, of metastatic carcinoma

Reutter, Garfield Arthur ✶ Rockport, Mo, Ensworth Medical College, St Joseph, 1911, died in the Lutheran Hospital, Omaha, Neb, March 24, aged 69, of cerebral hemorrhage

Robinson, Simon Frank ✶ Crane, Texas, Baylor University College of Medicine, Dallas, 1932, died March 13, aged 47, when his private plane crashed

Rosenberg, David Samuel ✶ Franklin, Neb, Creighton University School of Medicine, Omaha, 1934, served during World War II, affiliated with Mary Lanning Hospital in Hastings, died March 15, aged 42, of coronary thrombosis

Scharlock, Theodore M, Charleston, S C, Medical College of the State of South Carolina, Charleston, 1897, on the staffs of St Francis Xavier Infirmary, Roper Hospital, and Baker Memorial Sanatorium, physician at the city jail for more than 30 years, died March 15, aged 77, of carcinoma

Sellers, Galen Krauth ✶ Dassel, Minn, University of Illinois College of Medicine, Chicago, 1929, served during World War I, died April 18, aged 56

Smith, James Dismukes ✶ Kansas City, Mo, St Louis University School of Medicine, 1925, died April 26, aged 53, of hemorrhage complicating a duodenal ulcer

FOREIGN LETTERS

CHILE

Meeting of Lucas Sierra Foundation—The sixth clinical meeting of the Lucas Sierra Foundation was held in December, 1952, in Vina del Mar. Panel discussions on use of antibiotics in pediatrics, obesity, treatment of eclampsia, diseases of the spleen, and chronic nephritis were featured.

Obesity—The causes of obesity were discussed by Prof Armas Cruz and Drs F Donoso and A Jadresic. The authors described 180 patients who were considered obese because they weighed 20% or more than the standard weight for their sex and age. Of this group, 147 were women and 33 men. They were between 4½ and 66 years of age. The authors pointed out that when they started their work on obesity, they were inclined to classify obesity as exogenous or endogenous. As data were collected, however, they saw that it was not so easy to make clear-cut distinctions, no single theory explained all types of obesity. The law of conservation of energy can be applied in all cases, and therefore in obesity there is always a greater intake of food than the body needs. The question is whether this is the cause or the consequence of the pathological condition. In this resides the difference between endogenous and exogenous obesity. Exogenous obesity is more frequent when a great number of cases are studied, however, in every case all the multiple factors of endogenous and exogenous obesity must be analyzed, with metabolic, endocrine, constitutional, and purely exogenous factors taken into consideration. These investigators are inclined to believe that the most important factor in obesity is the exogenous factor, which is due to an increase of food intake and is produced either by bad habits of eating or by mental depression or psychic tension. The next most important factor is the endogenous mechanism, which depends on constitutional and hereditary conditions that act as predisposing factors.

The endocrine factors in obesity were analyzed by Dr A Atria and associates in 832 cases, 72% of the patients being women and 28% men. Obesity occurred most frequently in men around the age of 20 years and in women around the age of 40. In most women the onset of the obesity was associated with changes in ovarian function, such as that associated with the menarche, the menopause, pregnancy, or marriage, and frequently with changes in the menstrual cycle. A great intake of food and decrease of physical activity were also noted in these cases. In nearly 50% of the cases there was a familial tendency towards obesity and in 11% of the 832 cases there was also a familial history of diabetes. Dr Atria and his co-workers made a clinical diagnosis of simple obesity in 186 cases, with disorders of the hypothalamus and hypophysis implicated in 180 cases. They considered thyroid dysfunction responsible in 360 cases, of which 330 were due to hypofunction. Diabetes was present in 23 cases. Ovarian dysfunction was responsible for 230 cases, and testicular disorders (atrophy, cryptorchism, gynecomasty, and the male climacteric) were factors in 32 cases. Thus, according to these authors, endocrine factors were the causes in two-thirds of these cases, whereas the exogenous factor was responsible in only one third. Generally speaking, the most frequent endocrine disorder is hypothyroidism (50%), followed by the adiposogenital syndrome (25%). In men, however, the principal cause is the adiposogenital syndrome, followed by exogenous factors, and then by hypothyroidism. In women the main cause is thyroid deficiency, followed by exogenous factors, and then gonadal insufficiency as the third most frequent cause. The endocrine glands influence development of obesity by various mechanisms, including effects on food intake and physical activity and regulation of the metabolism.

Prof I Matte read a paper on the psychological aspects of obesity. If the patients are studied who are obese because of excessive food intake, it can be seen that the excess food

intake is basically an attempt at compensation for frustration. He states that psychoanalytic studies have revealed conflicts related to the oral stage of development in these patients. Together with the mother's milk, the infant receives love, and the patient who eats excessively tries to overcome nervous tension by overeating and thus regaining the feeling of being protected by the parent.

Other disorders associated with obesity were studied by Prof O Avendano in a total of 61 patients. The cardiovascular system was studied by means of electrocardiography, angiocardiology, measurement of the venous blood pressure, the velocity of circulation, and the blood volume (with Evans blue dye) and calculation of the minute volume (according to Remington's method). A complete history was obtained, and physical examination included study of the respiratory system, with measurement of the pulmonary ventilation and vital capacity. The endocrine system was studied to determine the function of the thyroid, ovaries, pancreas, etc. The osteoarticular system was studied by means of roentgenographic examination of the dorsolumbar spine, hip joints, knees, and feet. A roentgenogram of the skull and blood tests were made in all cases. Over 60% of the patients had a familial tendency towards obesity. In all cases there was an increase in food intake. Slightly more than 20% of the patients had biliary dyspepsia and 22% had bronchitis frequently. The blood urea level ranged from 50 to 95 mg per 100 cc in 31.5% of all the patients. High values for blood uric acid were found in 50%. Potassium deficiency was present in 56% and sodium deficiency in 51%. The erythrocyte-plasma chloride ratio was high in 35%, and the blood glucose level was above normal in 24% of patients. Hypercholesterolemia was found in 84%. The basal metabolism was normal in 30% and low in 70%. Study of the cardiovascular system revealed that 13 patients had hypertension. Over 50% had cardiac palpitations that were related to effort. The venous pressure, circulatory velocity, blood volume and minute output were normal in all patients. The electrocardiogram indicated normal function except in the hypertensive patients, whose electrocardiograms showed left axis deviation. Only in hypertensive patients did the angiocardiology show an increase in left ventricular pressure, however, 10% of the patients had signs of atherosclerosis. No abnormalities of the respiratory tract were observed, although a slight decrease of pulmonary ventilation was noted. Signs of ovarian insufficiency were noted in 69% of the women. The roentgenographic study showed some signs of arthrosis in 45%. The hemopoietic system as shown by the hemogram was normal in all patients.

The use of drugs to depress the appetite was studied by Drs G Rojas and H Diaz de Valdes in 278 cases. Their observations can be summarized as follows. The sulfate and tartrate salts of *d*-amphetamine were well tolerated, with intolerance for the sulfate evident in 23% of cases and for the tartrate in 3.1%. The drugs make adherence to a low calory diet less difficult, the appetite was decreased in more than 80% of the patients and slightly decreased in 10%. No increase of the intracranial or blood pressure was noted, and no patient suffered from insomnia. The discussion on obesity was concluded by a paper on surgery in obese persons by Prof R Urzua and co-workers.

Diseases of the Spleen—The discussion on pathological conditions of the spleen was opened by Prof E Egana and Drs A Rivadeneira and V Bejar, who read a paper on the functional morphology and physiopathology of the spleen. The role of the spleen as a reservoir is of great importance, and the autotransfusion that results when the spleen contracts following blood loss is well known. The spleen contains more red blood cells per gram than any other organ of the body, the hematocrit level being 82%. The authors consider destruction of the red blood cells to result from two factors: (1) the high lysolecithin content of the spleen and (2) stagnation of the red cells in the spleen. As an integral part of the

reticuloendothelial system, the spleen produces monocytes and plays a large role in phagocytosis. By hormonal regulatory mechanisms the spleen controls the maturation processes in the hematopoietic system and the delivery of blood cells to the peripheral circulation. To regulate production by the bone marrow, the spleen 'kidnaps' cells from the peripheral system. It is well known that the bone marrow requires certain enzymes, vitamins, and other materials for production of blood cells. The spleen requires the same substances for its own metabolism and competes with the bone marrow for them. Studies in the laboratory of experimental medicine have shown that splenectomy is followed by an increase in the level of circulating prothrombin. The spleen participates in the metabolism of iron as a member of the reticuloendothelial system. Warburg has shown that the spleen consumes such substances as glucose and glutamic acid and is active metabolically. It has a respiratory quotient of 0.92. Apparently the spleen does not require fats. Its glutamic acid content is comparable only with that of the brain. The spleen also contains glucuronidase, an enzyme that participates in disintoxication processes. The importance of the spleen in the body's defense against tumors, as an endocrine gland, and in Selye's general adaptation syndrome was also studied by the authors. Finally, the concept of hypersplenism was discussed, with the authors pointing out that there are two forms of hypersplenism: one that affects only red blood cells (hemolytic variety) and another that affects all blood cells (hemocytopenic variety). Splenectomy cures hypersplenism because it eliminates an endocrine inhibitory mechanism, because it removes an organ that destroys too many blood cells, or because it eliminates a tissue that competes with bone marrow for the same metabolites.

Emergency surgery of the spleen was discussed by Prof. R. Vargas and his co-workers. They described 88 cases, in which 82% of the patients were men, 84% of the patients were from 11 to 40 years of age. In 47 cases the surgery was necessary because of contusion, in 16 cases because of thoracoabdominal conditions, and in 31 because of abdominal conditions. Stab wounds were responsible for 28 cases and bullet wounds for 11 cases. Spontaneous rupture occurred in two cases. In 49 cases there were traumatic lesions, which were multiple in 14.2% and single in 85%. Complete rupture was present in 38 cases. General signs of splenic injury were anemia in 80% of cases, shock in 50%, abdominal pain in 74%, and muscular spasm in 60%. In 60% of the cases the patients were admitted to the emergency service in less than half an hour following injury, and in only 4% were they seen more than 24 hours later. The various types of surgical procedures employed were discussed. Generally speaking, before 1940 the mortality in such cases was 40% but since 1940 it has decreased to 23%.

Chronic Nephritis—Dr. H. Apablaza and Prof. C. Espildora discussed the fifth subject of the meeting, chronic nephritis. They emphasized the ophthalmoscopic findings in such conditions.

Postgraduate School Created—In August, 1952, the faculty of medicine of the University of Chile created the department of postgraduate medicine. Through this department the faculty intends to participate in three types of activity: (1) offering of courses for physicians practicing in Santiago and in the provinces, (2) granting of specialty degrees, and (3) establishment of scholarships for study abroad.

At the time of writing postgraduate courses were being held in Santiago, Valparaíso, Vina del Mar, Antofagasta, Talca, and Temuco; they were designed to combine practical with theoretical study and have been adapted to the needs of physicians in each locale. Thus in Santiago the courses continue for one month without interruption, in Valparaíso and Vina del Mar they are held on week ends, and in the other places they last for three or four weeks but are not in session continuously. Eighteen courses were in progress, 2 in Santiago, 3 in Valparaíso, and 12 in the rest of the country, on such topics as tuberculosis, pediatrics, psychosomatic medicine, general medicine, and general surgery. More than 100 persons are on the teaching staffs.

The faculty of medicine does not intend to foster development of superspecialists by its granting of specialty degrees; degrees will be granted in the fields of internal medicine, neurology, psychiatry, pediatrics, obstetrics and gynecology, and general surgery. In addition, specialization in public health, rehabilitation, and cancerology will be encouraged.

Under this program staff members of the university may be sent abroad. Visits of foreign lecturers to Chile for periods of not less than three months will be sponsored.

ITALY

Society of Cardiology.—Ballistocardiography in Mitral Stenosis—At a meeting of the Italian Society of Cardiology of the Latium region Nov. 26, 1952, Professors Collicelli and Puddu, from the University of Rome, read a paper on the modifications in the ballistocardiograms of patients with mitral stenosis following commissurotomy. The tracings were made according to the Dock and Taubman technique with the sphygmopiezoelectric transmission of Puddu. Although an exact tracing can not be obtained with this method, the sensitivity is uniform and the structure as well as the relative amplitude of the waves can be studied.

Observations in a large group of patients with rheumatic valve lesions revealed that usually in pure mitral stenosis the wave amplitude in the ballistocardiogram is reduced. In mitral stenosis associated with mitral insufficiency and/or aortic insufficiency, the amplitude is greater owing to the presence of the associated lesion and the increase seems to be proportional to the extent of the lesion. Professor Valdani, a pathologist and surgeon from the University of Rome, performed commissurotomy in 16 patients and the ballistocardiograms made several different times (from 15 to 30 days postoperatively) gave interesting data. In three patients with pure mitral stenosis the ballistocardiogram remained unchanged, despite the disappearance or decrease of the apical diastolic friction sound. In 13 patients with mitral stenosis, in 4 of whom it was associated with a mild aortic insufficiency, the amplitude of the postoperative ballistocardiogram was much greater than in the preoperative tracing. In all of these patients the diastolic apical friction sound had disappeared or was significantly diminished after the intervention, in three of them a systolic puff due to mitral insufficiency had appeared. According to Professors Collicelli and Puddu, the changes in the ballistocardiograms may be correlated with the increased systolic output that the surgical intervention causes in patients with mitral stenosis.

Trilogy of Fallot—Professor Provenzale, from Rome, discussed the trilogy of Fallot. Valvotomy was performed in 12 of his 20 patients. Section-dilatation of the infundibulum was performed in one, and Blalock's anastomosis in one. Four patients refused surgical intervention, the operation was contraindicated in one adult with a mild form, and one patient died in the hospital while waiting to undergo the operation.

The symptomatology of the trilogy of Fallot depends on two factors, the width of the interatrial communication and the extent of the pulmonary stenosis. The smaller the communication, the more the symptomatology resembles that of pure pulmonary stenosis and the less the malformation is tolerated. The greater the interatrial communication, the more pronounced is the cyanosis but the better the anomaly is tolerated. For these reasons and the consequent hemodynamic variations, the symptomatology varies. Essentially, however, the symptomatology consists of cyanosis, functional deficiency, and dyspnea. When dyspnea is present, it is more prominent than the other symptoms. There is also a constant harsh and jarring pulmonary puff. Often there is a delayed development, clubbed fingers, and hepatomegaly.

The criteria for diagnosis are clear lung fields, displacement of the aortic arch to the left, and, in general, absence of other malformations of the vessels and the heart. The pulmonary artery is dilated in most cases, the electrocardiogram shows right axis deviation. Catheterization permits penetration into the left atrium through the defect in the septum and reveals a right ventricular pressure that is significantly higher than

the systemic arterial pressure. Excellent angiocardigraphic diagnostic criteria have been reported by Teramo and Provenzale.

Differentiation from cyanotic heart disease, in which the pulmonary areas are congested, and from tricuspid atresia, which is characterized by left electrocardiographic prevalence, is easy. The differential diagnosis from the tetralogy and the pentalogy of Fallot is not difficult for the forms of the trilogies without cyanosis and with severe dyspnea. It is difficult, however, for the other forms of the trilogies when there are no anomalies of the vessels and the aortic arch is to the left or when the interventricular communication is decreased in size in cases in which the aortic arch is slightly to the right.

In the pentalogy of Fallot the diagnosis is more difficult because of the interatrial communication, which is usually narrow, and the position of the aortic arch slightly to the right. In such cases differential diagnosis preoperatively is impossible. The Condorelli-Turchetti test may perhaps reveal whether there is an interventricular septal defect.

Professor Provenzale discussed some cases of the tetralogy and pentalogy of Fallot in which a wrong diagnosis had been made and analyzed the causes of the mistake. An exact diagnosis is important because in patients with the trilogies the stenosis is always valvular and therefore amenable to valvotomy. In patients with the tetralogy of Fallot, however, the stenosis is almost always "subvalvular" and infundibular, a condition for which the operation has a high mortality rate.

In the trilogies with valvular stenosis, valvotomy is well tolerated, and the results are very good. Of 12 patients operated on by Professor Provenzale, only one died and most of the others recovered fully. The return to normal is progressive, it is slightly noticeable immediately postoperatively and becomes more evident after a few days, cyanosis disappears within a few months, and normal function is restored within four to five months. The systolic puff is modified but persists, and signs of valvular insufficiency do not appear.

Tuberculous Meningitis in Adults.—Professor Alessio reported on the results obtained with modern treatment of tuberculous meningitis in adults and elderly persons at a meeting of the Medical Society of Mantua that was held on Dec. 13, 1952, and of which he was the chairman.

Results in such cases are becoming more and more satisfactory, he attributes these favorable effects to the technique of the treatment, which is prolonged, to early initiation of treatment, and to better availability of streptomycin. Therapy must be prolonged for seven or eight months, with the proper doses of streptomycin combined with *p*-aminosalicylic acid orally or intravenously, and with vitamin A, vitamin D, and chaulmoogra oil. The use of streptokinase for intraspinal fibrinolysis had to be discontinued in some cases because of the pain produced in the vertebral column.

On the basis of the generally accepted concept that after antibiotic treatment a new disease becomes evident, Professor Alessio distinguishes four phases in this disease. The first phase is characterized by the quick appearance of the symptoms in the sensory system, the second, which is longer, is marked by the cessation of the irritating symptoms, the third phase, which lasts several months, is characterized by persistence of only one symptom (either elevated temperature, headache, or vomiting), by a decrease of albumin in the spinal fluid and of the lymphocytosis, and by an increase of sugar in the spinal fluid, the fourth phase, which may be the longest, is distinguished mainly by abnormalities of the spinal fluid. This classification into phases must be understood only as an arbitrary scheme, since one phase may overlap another. According to Professor Alessio, the prognosis is more favorable in women than in men.

At the same meeting Professor Ferran discussed the anatomic findings in cases of tuberculous meningitis treated with streptomycin. He reviewed the classical anatomic and pathological picture of tuberculous meningitis and then explained the many aspects that are seen today in dissecting bodies of patients who died during or after streptomycin therapy. The prolongation of the disease process has resulted in new forms of meningitis, such as meningoencephalitis and chronic tuberculous ependymitis, that were previously unknown.

The complete anatomic recovery from tuberculous meningitis after streptomycin therapy has been demonstrated at autopsy. This recovery has been reported by some authors in persons who had had tuberculous meningitis and died of some other cause. Therefore it can be said today that after streptomycin therapy some patients with tuberculous leptomeningitis recover with no marked sequelae.

Abnormal Physiology of Thyroid Gland.—At the January meeting of the Rome Medical Academy, Professor Vannotti, director of the University of Lausanne Medical Clinic, discussed abnormal physiology of the thyroid gland as studied by means of radioactive iodine. He emphasized the great progress made in this field since the introduction of radioactive iodine, which was used for the first time in experimental animals by American authors in 1939 and in man in 1945. Like physiological iodine, this substance diffuses throughout the organism into which it is introduced, but it has the advantage that its diffusion can be followed and checked by means of photographs, radiographs, and Geiger counters.

The modern techniques that are used to check the amounts of radioactive iodine in the blood and tissues (this is possible because of the clearness with which the radioactive iodine appears in pictures of histological specimens) make it possible to follow almost completely the metabolism of iodine. When iodine is introduced into the organism, it passes rapidly into the blood and then gradually becomes fixed in the thyroid and is partly eliminated through the kidney and the liver. From 40 to 60% of orally administered iodine is eliminated in 24 hours through the kidney, and 20% is eliminated slowly through the bile and intestine.

The quantity of iodine that is fixed by the thyroid and the rapidity of this process are proportional to the function of the gland, which normally fixes about 20% in 24 hours, in persons with hyperthyroidism as much as 40% can be fixed in 6 hours. The fixation of iodine in the blood also is proportional to the function of the thyroid gland, the blood fixes 10 to 15 μ g per 100 cc. in healthy persons, 22 to 25 μ g in persons with hyperthyroidism, and less than 4 μ g in persons with hypothyroidism.

It was found that only part of the iodine remains inorganic in the blood, whereas most of it becomes attached to proteins. When the iodine reaches the thyroid gland, it enters its cells and unites with a specific protein—thyroglobulin—which is found in the cells of the gland and does not exist in the blood. These phenomena of cellular fixation were very evident in films of histological specimens that Professor Vannotti showed.

By these methods it was seen that there are some thyroid follicles in which the iodine is metabolized from hematic thyroglobulin to diiodotyrosine and to thyroxine, other follicles do not participate in the formation of thyroxine. The fixation of iodine in tumors and the passage of thyroxine from the thyroid colloid to the blood were also checked. In the blood, thyroxine becomes fixed to proteins, mainly to globulins and to alpha globulins, and microphotographs show that iodine is found in the circulation as inorganic iodine, thyroxine, and triiodothyronine, which is a product of thyroxine degeneration. It was proved that it is not found under the form of diiodotyrosine, as had been believed, and that thyroglobulin is a specific protein of the thyroid and is never present in the blood.

Professor Vannotti discussed some results obtained in his clinic by various techniques in normal persons and persons with hypothyroidism and hyperthyroidism even in the presence of thiocyanate or thiouracil products, which are substances that inhibit the thyroid function.

There are limitations to modern techniques of study of the thyroid by means of radioactive iodine, and many conditions outside of the thyroid may lead to discrepancies. But, as Professor Vannotti said in his conclusion, a true thyroid "clearance" can today be determined by means of radioactive iodine and it is hoped that new contributions will be made in this modern field of medical science.

Arteriography of Abdominal Aorta.—Professors Baldrati and Possati, from the University of Bologna, read a paper on arteriography of the abdominal aorta at the meeting of the medical and surgical society of the Romagna region in Faenza Oct. 26, 1952, under the chairmanship of Professor Sighinolfi.

They pointed out contraindications for this investigation. Complications can be avoided by means of proper technical precautions and adequate preparation of the patient. They reported on their personal experience and showed a motion picture of numerous radiograms made at the University of Bologna Institute of Surgical Pathology. The main indications for aortography are obliterative diseases of the arteries, arteriovenous aneurysms and fistulas, embolisms of the abdominal aorta, Leriche's syndrome, and dystrophy of Fontaine. Retrograde aortography should be limited to the study of aortic aneurysms only.

The speakers concluded that arteriography of the abdominal aorta is sometimes an indispensable means of solving important diagnostic problems and selecting the best therapy, it can be carried out easily in any hospital. It should be limited, however, to selected cases and used only when other simpler methods have not given all the information necessary for good treatment of the patient.

PARIS

Method for Measurement of Left Auricular Pressure—Facquet, Lemoine, Alhomme, and Lefebvre have used the trans-bronchial route for measurement of the left auricular pressure, which has previously been impossible. The method is as follows. A bronchoscope is placed in position, and an aspiration rod with a special slightly bent forward needle soldered to its extremity is set in its lumen. The bronchial wall and then the auricular wall are pierced. The rod, irrigated with physiological serum, is connected to a manometer on which pressures are recorded. In *Archives des maladies de coeur et des vaisseaux* for August, 1952, pages 741-745, they described observations made on 10 patients. The method requires delicate technique but is harmless, the mucosa remained intact, and no hemorrhages or infection occurred, thanks to local and systemic use of antibiotics. Failure in four cases was due to obturation of the needle. In five patients with mitral deficiency, the authors noted pressure values corresponding to those found with open thorax. This new method, which is still in the experimental stage, may permit new methods for investigation of abnormalities of the mitral valve.

Cerebral Lesions Due to Anoxemia in Respiratory Paralysis—In the *Revue de neurologie* Professors Alajouanine, Bertrand, Castaigne, Gruner, and Pecker published the results of autopsy studies in 12 cases of acute anterior poliomyelitis, one case of polyradiculoneuritis, and one case of ascending paralysis. Ten of the patients spent some time in an iron lung. The authors noted that, in all cases of acute anterior poliomyelitis, there was some leptomeningitis, and diffuse vascular congestion as well as inflammatory lesions of the perivascular infiltration type. Vasodilatation of variable degree, often accompanied by perivascular hemorrhage, was usually observed. Lesions due to anoxemia were present in nine cases in the horn of Ammon, motor cortex, pallidum, putamen, occipital pole, and insular cortex. According to the authors, the extent of the lesions depends on the duration of anoxemia. Anoxemia of less than 20 days' duration produces lesions in 42% of cases, if it is present for more than 20 days, lesions occur in all cases. In most of the cases degenerative lesions reached the cortex and inflammatory lesions did not progress beyond the mesencephalon. From the clinical point of view, there is a great difference between the frequency of autopsy findings of such lesions and the small incidence of clinical syndromes. Only 4 of 14 patients experienced psychic disorders or disorders of consciousness.

Society for Ophthalmology—Cortisone—Guy Offret (Paris) reported to the Society for Ophthalmology a study of the use of cortisone in 200 cases over a one and one half year period. According to Offret, cortisone produces remarkable results in the treatment of syphilitic interstitial keratitis before vascularization has occurred. It is also effective in vernal conjunctivitis but has no effect in scleritis and episcleritis, it is harmful in trachoma. It is very effective in keratitis disciformis and

in virus keratitis provided the virus is no longer active. In keratitis due to the commoner organisms, relapses were noted. It is not very effective in severe ulcers or in trophic keratitis. Gougerot and Sjogren's ocular syndromes respond well to cortisone. Recent vascularization processes of the cornea and ocular burns are favorably influenced by local treatment with cortisone. Cortisone treatment is very effective in sympathetic ophthalmia. Except in serous central chorioretinitis, neuritis and ophthalmia atrophica, retinal alterations are modified little by cortisone.

Surgery in Glaucoma—E. Redslob (Strasbourg) brought up the disputed question of surgical intervention in chronic glaucoma simplex. He emphasized that some ophthalmologists are in the habit of operating on every patient whose intraocular pressure reaches or slightly exceeds 30 mg. Hg even though the function of the eye is unimpaired and the fundus is normal. According to the author, ocular pressure normally ranges from 12 to 35 mg and should be considered abnormal only when the pressure greatly exceeds 35 mg. The assumption that by reduction of the intraocular pressure atrophy of the optic nerve and excavation of the papilla can be prevented does not always prove to be correct, the pathogenesis of glaucoma simplex being still obscure. The author stated that, with Magi, he believes that disorders of intraocular circulation are due to disturbance of thalamic and hypothalamic centers. Even if decompressive operations may favorably influence circulation, they are always mutilating. As complications, the author cited the appearance of a central scotoma and an alarming diminution of central vision. He did not repudiate the often absolute necessity of surgical intervention, but advocated prolonged observation in every case of glaucoma and, above all, lengthy check of the effectiveness of miotics in variable doses. The author observed for 10 years the action of pilocarpine and found that neither the field of vision nor the acuteness of central vision was modified.

Ocular Implants—P. Bardelli (Metz) studied the action of various ocular implants. He noted that in treatment of myopia and retinitis pigmentosa, the use of implants from persons with the same condition gave the best results.

Surgical Treatment of Primary Bronchial Cancer—Sauvage, Le Brigand, and Merlier reported to the association of the Paris hospitals Sept 12, 1952, on the 144 operations they have done for primary bronchial cancer since 1948. In 53 cases exploratory thoracotomy was done and in 91 excision was done. The authors said that 40% of clinically detected cases were inoperable and that in 40% of those in which surgery was done the tumor could not be removed. This is due to a delay in the detection of cancer. According to the authors, cytological examination of material obtained by bronchoaspiration never gave accurate results. Even exploratory thoracotomy does not always permit recognition and delimitation of a tumor and even some biopsy specimens are of no value, as they are not always taken from the tumor or the invaded lymph nodes. Criteria for the choice of x-ray or surgical treatment were discussed. Only 5 of 261 patients treated with x-rays alone from 1946 to 1949 were living in 1949 in spite of the disappearance of cancerous tissues in several cases as confirmed by second operations or by autopsies. The authors reported on the operative mortality of excision: 3 of 15 operated on in 1948 and 1949 (20%), 5 of 21 operated on in 1950 (18%), 2 of 29 operated on in 1951 (7%). There were no deaths among patients operated on in 1952. This improvement of immediate results is due to improvement in surgical technique.

Demography—The department of statistics reported that the population of France increased from 40,300,000 in 1949 to 42,500,000 in 1952. The death rate decreased to 12.3 per 1,000 inhabitants. After a constant increase in the marriage rate following the liberation, there was a slight decrease from 32,000 in 1951 to 31,300 in 1952, the number of births also fell from 823,000 in 1951 to 820,000 in 1952. Moreover, in 1952 there was an excess of 290,000 births over deaths, in 1938 the deaths exceeded births by 6,000. There has been therefore a slight replenishment of the French population.

CORRESPONDENCE

CHLOROPHYLL AS A DEODORANT

To the Editor—I have recently seen an article in a professional journal on chlorophyllin products that seems to me to contain misleading and unreliable information. Some of this information pertains to advertising and can be used for the promotion of marketed preparations.

First of all, the material sold as chlorophyll is not chlorophyll at all and does not even merit the name chlorophyllin. Chlorophyll is a complex molecule containing the three important portions: (1) the group of four pyrrole rings, (2) the side-chains esterified with phytol and methyl alcohol, (3) the magnesium atom in the center. On treatment with alkali, the phytol and methyl alcohol are removed, and the remaining salt of the free acid is called a chlorophyllin. On subsequent treatment with acid, the magnesium is removed and the residue is called a pheophorbide. If the magnesium is removed first, the residue is a pheophytin. The pheophytins are olive brown but become green when a molecule of copper or nickel is added. To the best of my knowledge, the commercial preparations are copper or nickel pheophytins or pheophorbides. In the article in question, the term "complex processing" merely refers to this successive treatment with alkali, acid, and a metal salt. This is far from complex and only gives a false impression of difficulties in manufacture.

I understand that most of the commercial products involve the use of one group of patents. I am not familiar with the wording of these patents, but if, as I believe, they refer only to the preparation of water-soluble materials from chlorophyll, I must point out that these reactions were studied early in the 20th century by Schlunk and Marchlewski and by Willstätter. A particularly full account is given in Willstätter's "Untersuchungen über Chlorophyll," which was translated into English by Schertz and Merz and published in 1928. To my knowledge, the American Chlorophyll Company has been producing water-soluble pheophytin preparations for more than 10 years.

It is important to insist on the correct use of names because the word chlorophyll, or even chlorophyllin, gives a false impression to the public. Most persons associate the virtues of these prepared chlorophyll products with the known efficiency of chlorophyll in carrying out photosynthesis. This material is not chlorophyll, and, even if it were chlorophyll, it would not be in a state of biological activity. Chlorophyll, as it occurs in the leaf, is combined with proteins in the chloroplast, and it is only in that form that it is photosynthetically active.

By far the most misleading part of the article is the reference to tests that are supposed to have proved chlorophyll effective in deodorizing and in large numbers of other activities. The status of these tests is extremely doubtful. In the first place, it is hardly necessary to point out that the quantitative determination of the intensity of smell is a very difficult undertaking. As a rule, odors are compared by professional taste and odor experts who use a series of reference solutions that are made up in standard concentrations and that operate in as nearly as possible a reproducible way. It is quite out of the question to apply these procedures, rough and empirical as they are, to wounds and persons' breath or body odors. It follows that the so-called tests are very likely to be valueless. The publications in which I have seen descriptions of experiments of this sort make little or no mention of any precautions to obtain reliable data as to the intensities of the odors that they claim are removed. I have seen no reliable evidence to indicate the effectiveness of chlorophyll in any of the activities claimed for it.

It is true that I have by no means studied all of the literature dealing with the subject and that one can always draw a false impression from what is written. Let me say that I will be happy to withdraw any or all of the above statements if anyone can show me convincing evidence that chlorophyll acts as a deodorant or a cure for gingivitis or that it has any greater effect in promoting the growth of granulation tissue in

wounds than do a vast variety of other nonspecific materials. It is my impression that the public is being subjected to a racket of tremendous proportions and that the pharmaceutical industry is collaborating in this.

FOREIGN PHYSICIANS AS INTERNS AND RESIDENTS IN THE UNITED STATES

To the Editor—The Health Resources Advisory Committee of the Office of Defense Mobilization has requested me to furnish you with the following notice to hospitals and to foreign physicians planning to take internships or residencies in the United States. We hope this notice may prevent some of the difficulties that have occurred in the past.

"The Health Resources Advisory Committee of the Office of Defense Mobilization has been concerned with the past confusion and uncertainty in connection with the possible obligation of foreign physicians under the Universal Military Training Service Act when such physicians enter the United States for the purpose of taking an internship or residency.

"The Director of the Visa Office of the State Department has furnished the following information which should be helpful to all concerned.

"Arrangements for the admission of foreign medical students (physicians) for hospital training as interns and resident physicians may currently be made in accordance with the exchange visitor regulations promulgated under the United States Information and Educational Exchange Act of 1948, as amended (Section 201). Persons who have entered the United States with the exchange-visitor visas issued under this section of the law are exempt from the necessity of registering for military training or service.

"This type of visa may be issued only to qualified persons who have been selected by sponsors of programs that have been designated as exchange-visitor programs by the Department of State. American consular offices abroad have been instructed to advise aliens who have been accepted for interns or residents by American Hospitals to have the hospital, if they have not already done so, apply to the International Education Service of the Department of State for designation of an exchange visitor program. Hospitals planning to use alien physicians might prevent present undue delay by applying for such designation well in advance of the time they plan to use such physicians.

Persons who enter the United States for medical training with immigrant visas may, if they so desire, depart from the United States and apply to an American consular officer abroad for an exchange-visitor visa with which to return to this country and complete their training. Such persons may, however, render themselves inadmissible into the United States under the provisions of Section 212(a) (22) of the Immigration and Nationality Act as persons who departed to avoid or evade training or service in the armed forces of the United States unless they are able to establish to the satisfaction of the consular officer issuing the visa and of the immigration inspector at their port of entry into the United States that they were classified as nonimmigrants at the time of their original admission into the United States, that they have not during their stay in this country committed any act indicating an abandonment of nonimmigrant status or an acceptance of permanent residence status, and that they were properly classifiable as nonimmigrants at the time of their departure as well as at the time of their applications for exchange visitor visas. It is also to be borne in mind that, if such persons have failed to report after being called for induction by their local Selective Service boards, they will be regarded as delinquent by the Selective Service authorities and may be subject to prosecu-

tion by those authorities regardless of their possible acquisition of exchange visitor status. In this connection medical trainees in this country in the status of permanent residence, who intend to depart from the United States, should be advised to so inform their local draft boards in order that they will not be called for service while outside of the United States and, by failing to report, become delinquent in their Selective Service responsibilities."

CANCER DIAGNOSIS

To the Editor—The letter by L Henry Garland in *THE JOURNAL*, May 2, 1953, page 75, admonishes directly only the American Cancer Society in the statement of the Cancer Commission of the California Medical Association. The American Cancer Society, thus, becomes the whipping boy for valid or imagined misconceptions about cancer detection, the fairness of this is open to question.

First, the statement of the Cancer Commission charges that the proponents of cancer detection examinations "frequently imply that a detection procedure is a technical or quasi lay procedure." I can think of no form of physical examination that is not a technical procedure, and I know of no position ever taken by the American Cancer Society that would classify any detection procedure as "quasi lay" or anything except what it should be, a medical procedure. Second, the Cancer Commission defines detection as the "effort to discover evidence of disease in persons both asymptomatic and symptomatic." This interpretation differs from that of the American Cancer Society in that the Society regards detection as the effort to discover evidence of disease in presumably well (asymptomatic) persons. It differs also from the interpretation of the American College of Surgeons which defines a detection center as a medical facility in which a supposedly well person can receive an examination for the purpose of discovering "silent" cancer. Further, it differs from the interpretation of detection accepted by the National Cancer Institute. Finally, it differs from the definition of detection held by numerous independent authors whose papers have appeared in the recent literature (H W Jones and W R Cameron, F C Yeomans, E E Clifton and B Rush, C MacFarlane, A G Moore, A H Wells, J F Hynes, J L Neff, E S L'Esperance, and J P A Latour, et al). Third, the Cancer Commission holds that "there is no distinction between diagnosis and detection when the objective of the procedure is the identification of health or disease." As noted above, this view is not general. On the contrary, the distinction that detection procedures are for presumably well persons, while diagnostic procedures are for those presenting evidence (signs and/or symptoms) suggesting diseases, is so logical and so simple that it has occasioned no serious disagreement heretofore. Fourth, the commission states, "detection is a part of diagnosis, and not some mechanical or technical process which can safely be relegated to lay persons." To my knowledge, the American Cancer Society has never affirmed any other position, and its policy clearly recognizes the essential character of professional control, supervision, and participation in detection and diagnostic practice.

The Cancer Commission correctly maintains that "Detection is a step toward diagnosis", this statement, however, points to the flaw in the commission's position and is at variance with its interpretation quoted before. If detection is a step toward diagnosis, how can there be no distinction between the two? To detect is to look for evidence of disease, to diagnose is to determine the precise nature of that evidence of disease. Diagnosis begins where detection ends. Detection procedures are rapid screening procedures applicable to large numbers of persons. Diagnostic procedures must always be painstaking, careful, thorough, and designed to fit the individual problem at hand.

CERVICAL SYMPATHETIC BLOCK

To the Editor—In their article "The Evaluation of Stellate Ganglion Block for Acute Focal Cerebral Infarcts" (*J A M A* 151:438 [Feb 7] 1953), Millikan, Lundy, and Smith were unable to report any beneficial effects of stellate ganglion blocks in cases of acute cerebral vascular accidents as we did some years ago (*J A M A* 136:659 [March 6] 1948). Their study consisted of 27 patients in whom treatment included stellate ganglion blocks (we prefer the term cervical sympathetic block) and 60 in whom treatment was the same except that it did not include the blocks. They draw conclusions from a comparison of both groups. In their series, Millikan and associates not only obtained poor results but also observed that, in some of the patients who received blocks, the results were more unfavorable than in those who did not. We have treated a number of patients without any favorable result, but we cannot understand why there should ever be any unfavorable result. In no case of ours has the course of the hemiplegia been undesirably influenced.

A great deal of evidence has been adduced by others regarding the favorable effect of cervical sympathetic block in suitable cases. We do not consider a person in whom the spinal fluid is bloody suitable for this therapy. Even if good results were observed far less frequently than they are, they would still be of very considerable importance to the patient involved when they do occur. Since there has been so much positive evidence, generalizations should not be drawn from a few uninformative cases, unless they are very critically reviewed by the author and, most of all, by the reader. Depriving a patient of the possibility of immediate improvement or of shortening the course of the hemiplegia is serious, since a lack of results cannot possibly affect the patient's future course in any way. When the hemiplegic patient is completely or partly relieved in a matter of minutes, there is a sharp enough difference between that case and the case conventionally treated to make a doubtful series of controls superfluous.

The hemiplegic state involves the occurrence of many and diverse phenomena, the nature of which cannot always be determined clinically. We will not discuss the vasomotor influences in the cerebral blood flow, since they were discussed in our original contribution. The subject was also discussed by Hicks and Warren in 1951. It is probable that in a certain proportion of cases cerebral infarcts are on a purely vasomotor basis. Subintimal hemorrhages may also occur in the arteries of the cerebral cortex, just as they do elsewhere in the body. They may occlude the vessel by formation of a hematoma, or they may be the basis for a superimposed thrombosis as well as for angiospastic phenomena around the hemorrhage or elsewhere.

Because numerous inquiries have reached us during the last five years regarding our present attitude toward this controversial method of treatment, we wish to summarize our experience since 1948. Seventy-nine patients have been observed since our publication in 1948. Some of them were treated at home, and from some of them insufficient data have been obtained, so that we have 53 patients on whom accurate data are available. Twenty of these gave definite evidence of hemorrhage, three were given the diagnosis of brain tumor. This leaves 26 patients with so-called thrombosis and 4 in whom the clot was diagnosed as embolic in nature. Of the 30 patients who were given diagnoses of thrombosis or embolism and who were treated by sympathetic block, 10 obtained no appreciable relief, 9 obtained dubious relief from treatment, and 11 obtained definite and, occasionally, complete relief.

By definite improvement is meant an improvement in speech and motor power, a change in reflexes from flaccid to spastic, or the regaining of consciousness, if the patient had been unconscious. To validate our results, it was required that all of these phenomena occur within 10 to 30 minutes after the procaine injection and that they be coincident with the development of Horner's syndrome. The electroencephalogram may show marked improvement at the same time (de Takats, G., *Postgrad Med* 5:184 [March] 1949). We have said nothing about the influence of treatment on residual symptoms in such patients, since controls are obviously highly unsatisfactory. We are sure, however, that residual symptoms are very mark-

edly decreased. If a patient, who is in coma and who is aphasic, talks, sits up, and swallows liquids 10 minutes after a cervical sympathetic block, no statistics will convince us that the improvement is a coincidence.

Being clinicians, we cannot enter the discussion of the lack of results obtained by the nitrous oxide method of Kety. Even with that method, a decrease in vascular resistance has been reported after bilateral stellate ganglionectomy.

When the first procaine injection caused a favorable response, the injections were repeated for 5 to 10 days with or without a plastic tube in place, until the maximum amount of benefit had been obtained. In analyzing our results and those of others, some favorable and others unfavorable, our emphasis has always been on relief of the halo of vasoconstriction about the obstructed vessel and the possible relief of perifocal edema. Our aim was to accomplish, if possible, the same kind of sudden reduction of edema that occurs in a thrombophlebitic extremity after a paravertebral sympathetic block is performed.

It is difficult to explain the discrepancy between our findings and those of Millikan and his associates. Their material must have been vastly different from ours, since, in 60 patients used for control, only 4 lesions were reported as being due to hemorrhage, 53 were regarded as infarcts, and one as an embolus. In our previously reported series of 121 patients, 15 lesions were due to embolism, 53 to thrombosis, and 53 to hemorrhage. This ratio of thrombosis to hemorrhage was also seen in the classic study of Aring and Merritt reported in 1935. By hemorrhage we do not mean only the rupture of a larger artery, emphasis of this was adequately reduced by Scheinker in 1945. We mean hemorrhagic infarcts that may produce xanthochromic fluid four to five days after the insult. Their material must have further differed from ours in that only half the patients in whom hemiplegia developed over a period of 24 hours were still hemiplegic 14 days later. We seldom see such mild accidents and suspect that, in such patients, small, temporary circulatory deficiencies must have occurred.

We feel that cervical sympathetic block has not been followed by any harmful complications to the patient and that a few well selected patients seen and given injections in the first few hours show a moderate, but definite amount of benefit. In order for the cervical sympathetic block to be maximally effective, it must be done as an emergency measure. The point of this treatment is that relief should be expected only in the primarily infarctive lesion, with minimal progressive hemorrhage. Until such cases can be more precisely delineated, a number of patients will be given blocks without any certainty of benefit.

IDIOPATHIC ADRENAL APOPLEXY

To the Editor—Spontaneous idiopathic bilateral adrenal apoplexy associated with hypertension may not be so rare as the medical literature seems to indicate, in fact, the recent article by R. C. Greene in *THE JOURNAL*, May 9, 1953, page 133, called attention to its existence. It seems to me that milder, possibly unilateral, apoplexy of nonfatal outcome is relatively common among hypertensive patients but that it passes undiagnosed. The following case illustrates my contention. A 58 year-old white woman, with rather marked "essential" hypertension for the past 12 years, showed arteriosclerotic hypertensive retinal changes, "left ventricular strain pattern" on the electrocardiogram, and a moderate outflow tract enlargement of the left ventricle for the nine years during which I have observed her. Her general condition was fairly well balanced and unchanged for the same nine years. Suddenly she felt very weak, as if fainting, became pale, and had cold sweats. Her blood pressure dropped to 130/80 mm. Hg, before that accident," it was usually 220/120 mm Hg. She was in a state of semicollapse for three days, thereafter, she gradually recovered. In this patient, there was neither clinical nor electrocardio-

graphic evidence of a coronary accident, a cerebrovascular accident, or any visible or invisible hemorrhage or infection, in fact there was no evidence of any obvious cause for that sudden, hypotensive episode.

In retrospect, it is logical to wonder if some cases of proved coronary insufficiency, thrombosis, or cerebrovascular accident are not the consequence rather than the cause of a sudden drop of a comparatively stable high arterial tension in persons having a miopragic arterial system in whom abrupt disturbance in hemodynamic status occurred because of spontaneous adrenal apoplexy. Curiously enough, in the last few weeks, this case was the second in which I observed such a clinical picture.

GANGRENE FOLLOWING INTRA-ARTERIAL TRANSFUSION

To the Editor—In regard to the article entitled "Gangrene Following Intra Arterial Transfusion," by Blakemore, Dumke, and Rhoads, in *THE JOURNAL*, March 21, page 988, it should be pointed out that the technique of intra arterial transfusion employed by these workers is inherently hazardous and should be abandoned. It is unnecessary to ligate an artery being used for intra arterial transfusion purposes. It is natural that the application of a ligature will necessarily produce problems of gangrene as the authors indicate with reference to the anatomy of the hand.

Reference should be made to the article in *THE JOURNAL*, May 31, 1952, page 418, in which a technique is described that employs simply the introduction of a pencil point type needle or a Lindemann type needle into the exposed artery in a centripetal direction. This cannulization is performed just as if one were doing a venipuncture. A ligature may be placed about the vessel, provided the cannula is in place. The purpose of this ligature is obviously to secure the needle within the lumen of the artery. At the termination of the intra arterial transfusion, this ligature is, of course, cut.

After an intra arterial transfusion with this technique, one merely removes the needle and applies a gauze sponge with firm pressure against the vessel at the site of puncture. One or two mattress type sutures may be placed in the skin, and, after five minutes of firm pressure, the sponge can be removed and the skin then approximated. Further firm pressure is then applied, and, in our experience with the intra arterial transfusion as a planned routine procedure in patients expected to require large volumes of blood, we have seen neither gangrene nor subsequent hemorrhage from the arterial puncture site.

VINCENT J. COLLINS, M.D.
St Vincent's Hospital of the
City of New York
153 W 11th St., New York.

To the Editor—We are in complete agreement with Dr. Collins that an artery should not be ligated when intra arterial infusion is done. In one of the two cases that we reported (*J A M A* 151:988 [March 21] 1953), the intra arterial infusion was given before the patient came to this hospital, and, in the other, the vessel was temporarily occluded, contrary to our usual technique. While we believe the technique of exposing the artery and introducing a needle or cannula into it without interrupting its continuity is the best technique, it remains to be seen whether or not it is always safe. It is not impossible for a vein to become occluded after venipuncture, and such an occlusion could conceivably occur in an artery also, especially if the needle were left in the vessel for a considerable time.

We did not realize that there was any ambiguity in our statement that every attempt should be made to preserve the continuity of the vessel and are grateful to Dr. Collins for reemphasizing this point.

Neonatal Granuloma Venereum.—An infant boy was admitted to the hospital with a diagnosis of acute suppurative otitis media. There was a large tender mass behind the right ear, and exudate came from the right external auditory canal. A perforation was visible in the tympanic membrane. Treatment with penicillin and sulfadiazine proved ineffective, and the abscess in the postauricular area had to be incised and drained. Culture of the drained material yielded *Staphylococcus aureus* and *Staph. albus*. Later ulcers developed at the umbilicus and the dorsum of the penis, and a lesion appeared on the forearm, which destroyed a large part of the shaft of the radius. This last lesion was treated with x rays, in the belief that it was either Ewing's sarcoma or tuberculosis, but it increased in size. Kahn and tuberculin tests repeatedly gave negative results. Microscopic examination of the lesions suggested lymphogranuloma venereum so treatment with stibophen USP (Fuadin) was instituted five months after the first admission of the infant. Four two-week courses of the drug were given, each followed by a treatment free interval of a week. The daily dose was 2 cc. Following the second course of stibophen, the lesion of the radius began to shrink. The postauricular, umbilical, and penile lesions definitely regressed, although they did not heal completely. About a month after treatment for lymphogranuloma venereum had begun, it was found that the woman who had pretended to be the infant's mother was not his mother, but that the true mother was in another hospital being treated for granuloma venereum. The recalcitrant postauricular, penile, and umbilical lesions of the infant later subsided following treatment with streptomycin. In the absence of positive demonstration of Donovan bodies from each site, it is impossible to state unequivocally that all of the lesions in this case were due to granuloma venereum. The simultaneousness of their appearance coupled with their uniform response to specific therapy, however, indicates a common etiological background. The authors believe that this is the first reported case of neonatal granuloma venereum. They point out, however, that granuloma venereum presents a definite hazard to pregnancy and delivery, other authors having reported five infant deaths in 14 deliveries of mothers with this disease.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individual subscribers provided they reside in continental United States or Canada. Requests for periodicals should be addressed "Library American Medical Association. Periodical files cover only the last 11 years and no photoduplication services are available. No charge is made to members but the fee for other borrowers is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Pulmonary Stenosis in Chronic Cyanosis.—The importance of pulmonary stenosis in the production of chronic anoxemia and cyanosis was studied in 132 cases of pulmonary stenosis collected from the literature. Of these patients, 69 had pure pulmonary stenosis with closed cardiac septums, 35 had pulmonary stenosis with patent foramen ovale, and 28 had the tetralogy of Fallot. Analysis of reported pathological, physiological and clinical observations in these 132 patients showed that there is a fundamental difference between pure pulmonary stenosis and that associated with intracardiac shunts. In the 69 patients with pulmonary stenosis with closed septums the oxygen saturation of arterial blood has been normal. Pure pulmonary stenosis not associated with an intracardiac com-

munication is a noncyanotic disease, while cyanosis was frequently mentioned in the cases of this type, it was almost always associated with chronic cardiac failure. No relationship was observed between the presence and severity of cyanosis and the degree of pulmonary stenosis, such as one would expect if the two conditions had a causal relationship to one another. It is concluded that anoxemia is not a feature of pure pulmonary stenosis and that stagnant cyanosis, if present, is probably related to heart failure and not directly attributable to pulmonary stenosis. Of the 35 patients with pulmonary stenosis with patent foramen ovale, 30 were reported to have had cyanosis and in 15 it was described as severe. Anoxemia and chronic cyanosis thus are almost always present in patients with this type of pulmonary stenosis and are due to a right-to-left shunt through the foramen ovale, which is caused by pressure changes resulting from the pulmonary stenosis. This was attested by the direct relationship between the degree of pulmonary stenosis and the severity of cyanosis on the one hand, and by the similarly close relationship between the size of the foramen ovale and the cyanosis on the other hand. Furthermore, catheterization data, angiocardiographic reports, and experimental studies support this concept. All evidence in the 28 patients with tetralogy of Fallot, 18 of whom were severely cyanotic during the terminal stage of the disease, indicated that in cases with a large ventricular septal defect the systemic circulation must be supported by an elevated resistance within the lesser circulation as a condition for survival. Pulmonary stenosis constitutes one of the available mechanisms for this adjustment, and is not the only important factor in the production of anoxemia and cyanosis. The different roles of pulmonary stenosis in its various forms in the production of chronic cyanosis are of definite practical importance in connection with the surgical approach to correction of cyanosis and anoxemia: the right-to-left shunt through the foramen ovale can be lessened or abolished by pulmonary valvulotomy, while in the tetralogy of Fallot a Blalock or Potts anastomosis appears to be a much safer approach to the problem but represents a purely palliative procedure. As a result of their observations in the three syndromes of pulmonary stenosis, the authors state that pulmonary stenosis can be regarded as the principal factor in chronic cyanosis only in the syndrome of pulmonary stenosis with patent foramen ovale.

Quinidine in Transient Ventricular Fibrillation.—The effects of the oral administration of quinidine sulfate were studied on three patients with transient ventricular fibrillation during established atrioventricular dissociation. Continuous electrocardiograms were obtained before, during, and subsequent to the administration of the drug. The drug was administered in graded doses (3 grains [0.2 gm.] at hourly intervals or a single dose of 6 grains [0.4 gm.] or 10 grains [0.67 gm.]), and it was determined that in the same doses its action was variable from patient to patient. The duration of its effects as judged by the alterations in the cardiac rhythms and the intensity of its action depended on the size of the dose. Quinidine sulfate depressed conduction within the ventricles very early after its use, as indicated (1) by an unusual prolongation of the RST or QT segments, (2) by the appearance of progressively increasing negative T waves, and (3) by the development of deformed ventricular complexes associated with the onset of premature beats of the ventricles, only portions of which were superimposed on the ascending limbs of the T waves. These changes, which appeared early after the use of the drug, were similar to the changes observed as preliminary events in the natural course of transient ventricular fibrillation. Quinidine sulfate increased the refractory period of the ventricles, as may be judged by the early unusual prolongation of the returning cycles following the premature beats of the ventricles when they appeared during established atrioventricular dissociation. The drug was responsible for recurrent periods of transient ventricular fibrillation that persisted for hours once the mechanism set in following its use. Quinidine sulfate depressed both rhythmicity and irritability of the heart. Long pauses of asystole of the ventricle ended the fibrillary process and the impulse building centers in the atrioventricular node and ventricles were retarded. The drug augmented the effects of fatigue and rapid stimulation of the heart in the postfibrillary period.

Unlike procaine amide hydrochloride, quinidine sulfate did not influence the rhythmical center in the atrioventricular node unless conduction disturbances and refractoriness were affected first. The duration of the action of quinidine sulfate on such patients was longer than that of procaine, even when smaller doses were used. Quinidine sulfate is contraindicated in patients with transient ventricular fibrillation during established atrioventricular dissociation.

Familial Coarctation of the Aorta.—The occurrence of coarctation of the aorta in three members of one family, a 41 year old mother, a 16 year old daughter, and a 17 year-old son, is reported. Congenital heart defects occurring in several members of one family are not unusual, but familial coarctation of the aorta is unusual. These three cases support the view that heredity may act as an etiological agent in coarctation of the aorta, although this relationship must remain speculative.

Circumvallate Placenta.—Experiences with 41 cases of circumvallate placenta in 8,562 consecutive deliveries are presented to demonstrate the clinical significance of this condition. While the diagnosis of circumvallate placenta cannot be made with certainty until labor is completed and the placenta inspected, intermittent vaginal bleeding, hydorrhea, and uterine contractions are the common symptoms that suggest the presence of circumvallate placenta. The predelivery diagnosis is oftenest confused with placenta praevia and abruptio placentae. Management of patients with circumvallate placenta is principally expectant, although bleeding in some cases demands treatment. The threats to the mother are hemorrhage, infection, and third stage complications. The fetal survival rate is low, due primarily to abortions and premature labors. Despite the fact that fetal loss is high, circumvallate placenta is disregarded as an etiological factor in many reports on fetal mortality. Textbooks on obstetrics likewise give few factual data about the clinical significance of circumvallate placenta, while devoting chapters to placenta praevia. There is also a paucity of reports regarding this entity in the current literature. The authors feel that it is extremely important to be aware of circumvallate placenta, for although there is little definitive therapy, it is a serious error to treat patients actively for the mistaken diagnosis of placenta praevia. They wonder how many are subjected to cesarean section for circumvallate placenta by those who routinely use section, without vaginal examination, in patients with bleeding in the last trimester of pregnancy.

- Problems in Selection of Patients for Mitral Valvulotomy G Blorck —p 1
- Clinical and Physiological Study of Eight Cases of Isolated Pulmonary Stenosis R. Pannier A. van Loo K. Vuylsteek and others —p 8
- Ballistocardiogram in Acquired Valvular Disorders F Di Giuseppe —p 22.

Selection of Patients for Mitral Valvulotomy—Valvulotomy was performed on 13 patients with mitral stenosis who were regarded as good risks, 3 who were considered fair risks, and 2 who were poor risks. In evaluating the risk the authors took into consideration the functional capacity of the heart according to the classification of the New York Heart Association, and the mental and physical vigor of the individual patient. Of the 13 patients in the good risk group, 11 were clinically improved by the operation and 2 were not. Of the three less good risks, two were clinically improved and one died of ventricular fibrillation 48 hours after the operation. The two bad risk patients died postoperatively, one from cerebral embolism and the other from cardiac failure. Previous embolization increases the risk of mitral valvulotomy because of the possible presence of thrombotic material in the left auricle. Angiocardiography performed in 17 patients to determine the presence of thrombotic material preoperatively failed because only fairly large thrombi can be detected by this method, whereas the incidence of small thrombi is much greater. Attempts to collect thrombotic material by a hoop net passed into the left auricle along the surgeon's finger have not been encouraging. Early anticoagulant therapy with heparin and bishydroxycoumarin (Dicumarol) instituted at the end of the first or at the beginning of the second postoperative day did not cause any complications and should be carried out when a cerebral embolism has occurred during or after the operation and also in patients with large auricles, who are likely to have thrombosis within the auricle in connection with the intervention. As a result of his experience, the author states that many patients with mitral stenosis classified in functional group 3 of the New York Heart Association will benefit from valvulotomy. Patients classified in functional group 2 are good risks but derive little or only moderate benefit from surgical treatment, an improved technique may give them a better chance in a few years. Patients aged over 50 and with repeated embolisms have been considered as unsatisfactory risks, and patients with predominant mitral regurgitation, with active rheumatic or subacute bacterial endocarditis, with gross cardiac failure, or with damaged myocardium, have been considered unsuitable for mitral valvulotomy.

Isolated Pulmonary Stenosis—The occurrence of isolated pulmonary stenosis is reported in five children between the ages of 4 and 15 years and in three adults aged 24, 27, and 52. Four of the eight patients had no complaints and three complained of moderate dyspnea on effort, only the 52-year-old patient had moderately severe dyspnea and mild peripheral cyanosis, but this patient had malignant hypertension associated with pulmonary stenosis. A pronounced systolic thrill was felt in all patients, in five it was felt in the second left intercostal space and in one in the third intercostal space, in the remaining two it could be felt in two distinct locations, but it was more pronounced in the second intercostal space. In six patients moderate hypertrophy of the right ventricle was demonstrated on roentgenologic examination, while associated hypertrophy of the left ventricle was observed only in the 52-year-old patient. Electrocardiographic recording revealed deviation of the electrical axis to the right in five patients, a normal electrical axis in two, and left axis deviation in the patient with malignant hypertension. Examination of the fundus oculi revealed slight dilatation of the retinal veins in all patients and occasionally of the retinal arteries also. Cardiac catheterization was performed in all patients, and pressure

values as well as oxygen volume percentage corresponded with the criteria generally agreed on for diagnosis of isolated pulmonary stenosis. In six patients the ether circulation time test was performed by injecting 0.3 cc of ether intravenously or the same amount directly into the cardiac cavity through the catheter. All the patients had negative results from the test. Isolated pulmonary stenosis is a commoner congenital heart disease than was formerly believed. It rarely causes pronounced discomfort, and it may be tolerated well for a long time. Cardiac catheterization is of considerable aid in establishing the diagnosis. Determination of the oxygen content of blood samples withdrawn from the chambers of the right heart, the pulmonary artery, and the femoral artery are essential for making the differential diagnosis between pure pulmonary stenosis and that associated with arteriovenous or venous-arterial shunt. In isolated pulmonary stenosis the ether circulation time test is always negative. With the methods available today, the presence of a small but dynamically unimportant shunt cannot be excluded.

- Ten Cases of Thromboangitis Treated by Adrenalectomy M. R. Tingaud. —p 166

Adrenalectomy for Thromboangitis—Adrenalectomy combined or not with sympathectomy was performed on 10 men between the ages of 26 and 60 with thromboangitis obliterans. Four of the 10 patients obtained excellent results, with complete disappearance of the functional disorder and the trophic disturbances, one a good result with diminished functional disturbances compatible with a certain degree of active life, and two moderate results with simple stabilization. Three were therapeutic failures, with death resulting in one. These results correspond to those reported previously by Wertheimer and Leriche. Adrenalectomy is not a miraculous method of treatment but a functional operation, it does not exert any effect on an established thrombosis, but the progressive character of the disease and its spasmodic element are definitely benefited. It has been emphasized that most patients were operated on after failure of medical treatment. Adrenalectomy should never be performed in senile angiopathy, and, although it is the method of choice for thromboangitis obliterans, it is bound to fail in patients in whom an arterial tree has been considerably impaired by sclerosis and has been obliterated in its total distal portion. Microscopic examination of the removed adrenals revealed hyperplasia of the medulla but also pronounced changes of the cortex. This is additional evidence in favor of adrenalectomy but not a proof beyond any doubt, since good results with medullectomy alone had been reported by other workers. In conclusion the author states that the results of medical treatment can not compare with those of surgical treatment. Adrenalectomy or medullectomy, when done early in a still functional stage of the disease or when thrombosis is still limited, will give results superior to those of any other therapeutic procedure.

Isoniazid in Treatment of Pulmonary Tuberculosis.—A clinical trial of isoniazid alone and in combination with other drugs in the treatment of pulmonary tuberculosis is being conducted by the British Medical Research Council Streptomycin (1 gm daily) and isoniazid (100 mg twice a day) were given to 142 patients, streptomycin (1 gm daily) and sodium *p*-aminosalicylate (5 gm four times a day) were given to 102 patients, and isoniazid alone (100 mg twice a day) was given to 120 patients. The type of treatment given was allocated at random. Three main groups of patients were observed (1) those with acute, rapidly progressive disease of recent origin, (2) those with other forms suitable for chemotherapy, and (3) those with chronic disease unlikely to respond to chemotherapy. The distribution of patients with severe and less severe illness was similar for each type of treatment. The general condition of the majority of patients had improved at the end of three months, but the differences between the results obtained by the various types of treatment were slight. Average weight gains were 13 lb for patients receiving streptomycin and isoniazid, 6 lb for those receiving streptomycin and *p*-aminosalicylic acid, and 13 lb for those receiving isoniazid alone. The temperature of febrile patients fell to normal in 82% of those given streptomycin and isoniazid, 76% of those given streptomycin and *p*-aminosalicylic acid, and 68% of those given isoniazid. Reduction of the erythrocyte sedimentation rate from 21 mm or more to 10 or less was observed in 45% of the patients given streptomycin and isoniazid as compared with 21% of those given streptomycin and *p*-aminosalicylic acid and 25% of those given isoniazid. Patients receiving combined treatments showed a better radiographic response than those given isoniazid alone. The proportions of patients bacteriologically negative, both on direct examination and on culture, at a single examination after three months of treatment were 67% for those receiving streptomycin and isoniazid, 55% for those receiving streptomycin and *p*-aminosalicylic acid, and 37% for those receiving isoniazid. The results obtained at the end of three months indicate that the combination of streptomycin and isoniazid with the dosages used was the most effective treatment, although its superiority to streptomycin and *p*-aminosalicylic acid was not great, full evaluation cannot be made without a longer period of observation. Studies of drug resistance show that none of the three drugs, isoniazid, streptomycin, or *p*-aminosalicylic acid, should be used by itself, nor should any two of them be used in combination for a patient who has already developed resistance for one of the two.

Use of Chlorophyll as a Deodorant.—Experiments are reported to show that chlorophyll has no value as a deodorant. Four types of chlorophyll were used (1) sodium copper chlorophyllin in a solution of 1 gm in 10 ml, (2) a crude commercial preparation of water soluble chlorophyll intended for use as coloring matter, (3) a proprietary preparation intended for use as a wick type atmospheric deodorant, and (4) a proprietary

preparation for dispensing purposes, said to contain 12.5% water-soluble chlorophyll. Two experiments providing objective determinations of the effect of chlorophyll on odors showed that (1) exposure of methylmercaptan gas in a closed system to water soluble chlorophyll did not reduce the amount of gas passing over to an indicator as compared with a control, and (2) exposure of small quantities of methylmercaptan gas to water-soluble chlorophyll in a closed system for up to three days did not remove the smell of mercaptan. The third experiment, in which it was found that exposing various strong smelling solutions to water soluble chlorophyll by mixture did not remove the smell of the solutions even when exposure was continued for one or more months, depended on the observer's sense of smell. Criticism based on this fact, however, would be equally applicable to all previously published findings supporting the value of chlorophyll as a deodorant. Chlorophyll was administered, in various forms, to an incontinent patient without any effect on the characteristic odor of urine. Large doses of chlorophyll tablets (at least 25 times greater than those usually recommended) failed to prevent the appearance of the distinctive odor of asparagus in the urine after the eating of this vegetable, and 800 mg of chlorophyll taken daily for one week did not remove the odor of urine, feces, or axillary perspiration.

 *Two Years Experience with Thiosemicarbazone in Tuberculosis C Rognato—p 15

Thiosemicarbazone in Tuberculosis.—A follow up of 143 patients with various forms of tuberculosis 6 to 12 months after discontinuation of thiosemicarbazone therapy revealed good results in 72% of them. The effects of the drug were especially good in patients with secondary hilitis, early in filtrations, lobitis, nodular infiltrations before the onset of ulcerous and caseous lesions, and military and cavitary forms amenable to collapse therapy. Patients with chronic primary or secondary tuberculosis had slight improvement only, whereas results were poor in those with cavitary forms. In these patients, however, the intracavitary secretion was decreased. The drug was given orally to all patients and those with osteochondritis received it locally also. On the first day 25 mg were given in two divided doses after meals, every day thereafter the dose was increased by 25 mg up to a total daily dose of 150 mg. This quantity was given in three divided doses after each meal, and this first course of therapy was continued for 90 days. After a 30 day treatment free interval, 100 mg. were again given daily for 30 days in two divided doses after breakfast and dinner. The therapy had to be discontinued in 10 patients because of side effects attributable to their neuropathic tendency. After 10 to 15 days, there was an improvement in most of the other patients, asthenia decreased, elevated temperatures dropped, and appetites increased, and after 25 to 50 days 92% of the patients had gained weight. The erythrocyte sedimentation rate decreased in 90% within 15 to 20 days. The radiological picture improved in 101, especially in those with hilitis, early inflammation, lobitis, and pneumonia. Slight traces of albumin were found in two patients during the treatment, while they disappeared in 6 of 10 patients in whom they were present before the drug was given. Skin reaction to percutaneous injection of thiosemicarbazone increased in 35 patients. To account for the greater in vivo action of the drug as compared to its in vitro action, the author says that biochemical changes occur in the organism after the administration of the drug and these produce defense reactions. In fact, the decrease in the erythrocyte sedimentation rate is, according to him, too abrupt to be attributed to the bacteriostatic action of thiosemicarbazone alone. A twofold activity of the drug, bacteriostatic and nonspecific, is suggested and is attributed to the complexity of the thiosemicarbazone molecule.

BOOK REVIEWS

Acute Renal Failure, Including the Use of the Artificial Kidney By John T. MacLean M.D. F.R.C.S.(C) F.A.C.S. Assistant Urologist Royal Victoria Hospital Montreal Cloth \$6.50 Pp 114 with 28 illustrations Charles C Thomas Publisher 301 327 E Lawrence Ave Springfield Ill Blackwell Scientific Publications, Ltd 49 Broad St Oxford England Ryerson Press 299 Queen St W Toronto 2B 1952

This book describes and interprets the signs of acute renal failure and presents the treatment, including the use of the artificial kidney. There are discussions on factors that produce renal insufficiency, role of acid base balance, renal circulation, lower nephron nephrosis, and treatment. But the work is unsatisfactory, for inaccurate or careless statements are found throughout the book. The author often fails to recognize that the support offered for his beliefs has been disproved or is, at least, far from accepted. For example, it is stated that renal blood flow in acute renal insufficiency is dependent on increased viscosity, vasoconstrictor material, vasodepressor material, Trueta arteriovenous shunts, and the Barrie renal sponge. Investigators' names are used or omitted for no evident reason, for example, Borst is not mentioned in connection with the high caloric diet Kolff reported on the artificial kidney in 1943, not concurrently with Murray in 1947. The make up of the book is not up to the usual standard of the publisher. A graph on page 18 is upside down, the labeling is careless, i.e., chlorine for chloride, and the purpose of several beautiful color plates, on pages 32 and 33, is not clear.

Syphilitic Optic Atrophy By Walter L. Bruetsch M.D. Clinical Professor of Neurology and Psychiatry Indiana University School of Medicine Indianapolis. Publication number 142 American Lecture Series monograph in Bannerstone Division of American Lectures in Ophthalmology Edited by Donald J. Lyle M.D. F.A.C.S. Professor of Ophthalmology College of Medicine University of Cincinnati Cincinnati Ohio Cloth \$5.50 Pp 138 with 27 illustrations Charles C Thomas Publisher 301 327 E Lawrence Ave Springfield Ill. Blackwell Scientific Publications Ltd 49 Broad St. Oxford England Ryerson Press, 299 Queen St. W Toronto 2B 1953

The data analyzed in Bruetsch's monograph on syphilitic optic atrophy at last permit the optimistic statement that "the time has arrived when blindness due to syphilitic optic atrophy can be prevented. This achievement has been accomplished by the recognition of the early stages of the disease and particularly by the advent of successful treatment methods." This book is written by a man who has studied many cases both clinically and pathologically. The subject is covered from every angle: historical background, incidence of syphilitic optic atrophy, its incidence in various types of neurosyphilis, and its relative incidence among optic atrophies from other causes. After careful review of the theories of the pathogenesis of syphilitic optic atrophy, the author proposes a convincing concept, from his clinicopathological studies, that so-called primary syphilitic optic atrophy is always due to a chronic inflammatory process, which is followed by a slow degeneration of the nerve fibers. Bruetsch has presented much evidence, both from experience and from the literature, that contradicts Igersheimers isolated observation of degeneration without inflammation. This indicates that there is but meager proof to justify such an important concept as the existence of a purely degenerative type of optic atrophy in general paralysis and in tabes dorsalis (so-called primary optic atrophy).

Other phases of the subject of syphilitic optic atrophy, such as pathology, clinical features, treatment, and prevention, are covered. There is also a supplement in which consecutive or secondary syphilitic optic atrophy, gummatous meningitis and optic atrophy, and syphiloma of the chiasm and optic nerves are included. The book has an excellent bibliography and index, and the illustrations are well chosen.

Special mention should be made of Bruetsch's discussion of therapy. While all agree that penicillin has an almost miraculous action in the acute early processes, such as acute syphilitic

meningitis, and has given great promise of a similar effectiveness in the late manifestations of syphilis of the central nervous system, the large total dosage scheme that the author suggests for the treatment of syphilitic optic atrophy deserves careful trial. Certain practical suggestions for the prevention of this costly and important cause of blindness are also outlined. This small volume should be studied by the ophthalmologist and the syphilologist.

Clinical Problems of War By Allan S. Walker M.D. Ch.M. F.R.A.C.P. Volume I Australia in the War of 1939-1945 Series 5 Medical. Cloth 35/ Pp 726 with illustrations Australian War Memorial Canberra [for sale by Angus & Robertson Limited 89 Castlereagh St., Sydney N.S.W. Australia] 1952

This volume is part of a set that, when finished, will comprise the medical history of Australia during World War II. It concerns the diseases and injuries that affected the Australian armed forces. The seriousness of the various diseases in respect to the Australian forces can be judged in part by the size of the chapters in this book. The chapter on malaria, the largest chapter, is an excellent review of the experience of Australian troops with malaria in the various countries in which they served. It also reviews the work of the research unit on the newer antimalarial drugs. Since only a few cases of Brucella infection occurred in the Australian services, the chapter on brucellosis is less than one-half page. The other chapters pertain to blood transfusion, cerebrospinal meningitis, amebiasis, wounds, amputations, diphtheria, filariasis, ankylostomiasis, schistosomiasis, tuberculosis, cardiovascular diseases, malnutrition, plastic and faciomaxillary surgery, anesthesia, diseases of the central nervous system, bacillary dysentery, dermatology, ophthalmology, pathology, psychiatry, and dental surgery. While the author claims this volume is neither a textbook nor a military manual, one definitely feels and appreciates its textbook nature. He gives credit to others who assisted him. There are illustrations of methods and equipment, but the outstanding feature is the simple language used masterfully by the author. Unlike some military histories, this book is easy to read. There are no military orders and directives usually so numerous in histories of wars.

The author pays tribute to the part played by applied science in alleviating the suffering caused by war. But science, he says, is not enough. There is need too for humility, for the new developments of the scientific method are leading man more and more to destroy, not only by physical violence but also by the moral violence of suppressing and denying the true culture of mind and spirit. Should we not look, he asks, to ends rather than to means, nothing but a change of heart can achieve this, for it is a question of spiritual values. The author closes his brief epilogue with the statement 'The doctor is still a champion of the individual, he stands at the springs of life and death in peace as in war, and as a citizen he must accept this challenge.'

Current Therapy 1953. Latest Approved Methods of Treatment for the Practicing Physician Editor Howard F. Conn M.D. Consulting editors M. Edward Davis et al. Cloth \$11 Pp 835 W. B. Saunders Company 218 W. Washington Sq. Philadelphia 5 7 Grape St. Shaftesbury Ave London W.C.2 1953

The current edition of this publication is a symposium of the present methods of treatment used by prominent authorities in both medicine and surgery. The list of contributors represents a veritable "Who's Who" of American clinicians in the various specialties, and the book covers all phases of therapy for all types of human disease. The subject matter is arranged according to the usual textbook classifications of disease and is primarily restricted to treatment. Preventive measures are indicated when pertinent, but etiology and diagnosis are not discussed except when they are an integral part of therapy. In some diseases the method of more than one contributor is outlined, and these may differ in accordance with the par-

ticular views or concepts of the authors Editorial opinion is purposely avoided to preserve the point of view of each contributor Long-established treatments as well as newer advances are included depending on the preferences of the authors Operative techniques are not described in detail, but surgical treatment is specified when indicated

The discussions of treatment are concise and designed for ready access The two-column pages are especially suited to rapid reading In addition to the main text, the book includes a roster of drugs, metric and apothecary systems, percentage tables and author and subject indexes Typographic errors are not often encountered The use of an amphetamine inhaler in the later stages of the common cold, as mentioned on page 8, is out-of-date, since amphetamine is no longer marketed in that form It has been replaced by the propylhexedrine (Benzedrex) inhaler, mentioned on the succeeding page In the statement on page 112, "isonicotinic acid hydrazine—the accepted generic name now is isoniazids," the last word should be isoniazid The preference given to trade names in the roster of drugs is disappointing and the descriptions included after each drug closely resemble advertising material for the particular brand listed As a whole, this book will be welcomed by physicians who desire a complete and convenient reference to current methods of therapy

Familial Nonreaginic Food Allergy By Arthur F Coca M.D With contributions by Conrad Berens M.D et al Third edition Cloth \$10.50 Pp 279 with 21 illustrations Charles C Thomas Publisher 301-327 E. Lawrence Ave Springfield Ill Blackwell Scientific Publications Ltd 49 Broad St Oxford England Ryerson Press 299 Queen St W, Toronto 2B 1953

This book presents the concept of a form of allergy that the author claims affects more than 90% of the population He calls this idioblastosis, or familial nonreaginic food allergy The presence of such allergy is suspected with a history of any of the following symptoms headache, heartburn, indigestion, constipation, nervousness, neuralgia, abnormal tiredness, and hemorrhoids Most cases of idioblastic allergy are caused by foods, although a large percentage are caused by sensitivity to tobacco and house dust It is inferred that such food allergy is involved, either as a direct or predisposing cause, in hypertension, epilepsy, glaucoma, dementia precox, frigidity, nausea and vomiting of pregnancy, multiple sclerosis, carcinoma of the breast, and colds In discussing other infections, the author alludes to 'the importance of idioblastic allergy as a predisposing influence in poliomyelitis' He says elsewhere "Among a group of 297 persons affected with clinically malignant tumor of the breast, none was found in whom food allergy could reasonably be thought to be absent," and "The evidence suggests that multiple sclerosis is curable through the simple stabilization of the pulse by avoidance of pulse-accelerating allergens"

The diagnosis of idioblastic allergy is made if the patient has a pulse rate of 88 or higher at any time and if the daily range exceeds 20 An increase of several beats after ingestion of a trial food indicates an allergy to that food Treatment is by avoidance of the offending agent, histamine injections, and sympathectomy The first case of sympathectomy for food allergy was the author himself, who was forced to do something drastic when he found himself clinically allergic to all avoidable foods excepting beef" On the basis of well-considered opinion and experience of mature workers in allergy and medicine, the concept presented cannot be supported

Lumbar Disc Lesions: Pathogenesis and Treatment of Low Back Pain and Sciatica. By J R Armstrong M.D MCh F.R.C.S Orthopaedic Surgeon to Metropolitan Hospital London Foreword by H Osmond Clarke C.B.E F.R.C.S Orthopaedic Surgeon London Hospital Cloth \$8 Pp 228 with 77 illustrations Williams & Wilkins Company Mount Royal and Guilford Aves Baltimore 2 E. & S Livingstone 16 and 17 Teviot Place Edinburgh 1 1952.

This is one of the outstanding contributions to the literature on the intervertebral disk The author briefly and concisely presents the causes of radiating low back pain and discusses the fundamental basis for each symptom and sign The clinical picture is crystallized for the reader in the inimitable style of the accomplished British writer and is illustrated beautifully with colored and black and white figures The author draws

on his large experience in the diagnosis and treatment of ruptured disks to discuss the most successful techniques of diagnosis and surgical treatment His opinions are conservative and highly acceptable, however, the danger of diagnostic spinal puncture and myelogram is overemphasized The dangers described do not coincide with the experience of others in large series of cases Furthermore, not all will agree with Armstrong that surgical fusion after removal of a ruptured disk is the procedure of choice The general opinion is that fusion is not necessary unless specific indications for fusion exist aside from the ruptured disk This book is recommended to all who are interested in the diagnosis and treatment of ruptured intervertebral disk

Visual Anatomy: Thorax and Abdomen By Sydney M. Friedman, M.D Ph.D Professor of Anatomy University of British Columbia Vancouver Canada. Cloth \$10.50 Pp 203 with 91 illustrations. Charles C Thomas, Publisher 301-327 E. Lawrence Ave Springfield Ill Blackwell Scientific Publications Ltd. 49 Broad St. Oxford, England Ryerson Press, 299 Queen St. W Toronto 2B, 1952.

The author has attempted to present the anatomy of the thorax and abdomen visually and has utilized the written text only as a supplement. *Anatomic variations and anomalies have been intentionally omitted* The presentation begins with the skeletal framework and leads outward to the soft tissues The material is extremely sketchy and abbreviated. The layer-by-layer presentation has been adhered to especially in the section dealing with the mediastinum where "planes" are discussed. This is commendable, since it gives the reader a tridimensional perspective

Unfortunately, the thymus has been portrayed in a misleading fashion No concept can be gained as to the size, structure, limits, and form of this organ as seen in figure 26 This volume has been written for clinicians as well as others, however, no clinician would agree with the presentation of the gallbladder as depicted in figure 44 No mention is made of its fundus, corpus, infundibulum, and neck. Of particular importance is the relationship of the infundibulum to the extrahepatic biliary ducts, yet there is no description of this in the figure or in the text The inconsistency of the presentation of the material in color confuses the reader, for example, figure 47 shows the branches of the celiac axis and the superior mesenteric artery in red, however, figure 49 shows the blood supply to the stomach in black Because of poor printing it is particularly difficult to read the labels in the illustrations

A great deal of sincere effort has gone into the preparation of the text and the execution of the illustrations Since the work is directed to postgraduates as well as undergraduates it might have been well to correlate 'operating table anatomy' with that found on the cadaver

The Practical Management of Pain in Labour By W D Wylie, M.A., M.B. M.R.C.P. Anaesthetist to St. Thomas's Hospital and National Hospital for Nervous Diseases, London Cloth. \$3.50 18s.6d. Pp 148 with 42 illustrations [Year Book Publishers Inc. 200 E. Illinois St. Chicago 11] Lloyd-Luke (medical books) Ltd 49 Newman St. London, W1 1953

This book was written primarily for anesthetists The subject matter covers anatomic and physiological considerations, agents, apparatus, normal labor, abnormal labor, cesarean section, local analgesia, and therapeutic analgesia and anesthesia Each chapter is followed by a brief, well selected bibliography from British and American literature The volume concludes with an adequate index The author deals mainly with the application of analgesic and anesthetic agents and techniques, with considerable emphasis on analgesic concentrations of inhalation agents Inhalation apparatus presented is mainly of foreign manufacture and unfamiliar to many American anesthesiologists Inclusion of the limitations placed on the British midwife regarding the use of analgesia in labor is interesting to American readers It is apparent that subarachnoid and extradural techniques have gained greater favor in this country than in England, probably because of the fact that a great proportion of all deliveries there take place at home rather than in hospitals There is no mention of the usefulness of ethylene in obstetrics

Since the author writes in an authoritative manner, some of his statements would have more emphasis if his own experience with methods, percentage of complications, and failures

was included. The author is to be complimented on the excellence of his writing in an overlapping field, since material pertinent to the obstetrician's responsibilities is included. His emphasis on full cooperation between obstetrician and anesthesiologist for the most desirable and safest results is timely. This clear, concise, and well written book, with excellent illustrations, can be read profitably by all physicians concerned with management of pain in obstetrics.

Der Kopfschmerz. Von Priv. Doz. Dr. Ernst Pichler. Graz. Mit einem Geleitwort von Univ. Prof. Dr. Otto Pütz. Cloth \$6.45. Pp. 214, with 17 illustrations. Springer Verlag. Mölkerbastei 5. Vienna 1. 1952.

The author describes the various kinds of headache, with emphasis on etiology and differential diagnosis. The first part covers general considerations of anatomy and physiology, especially vasomotor phenomena, and the second part takes up particular problems, such as headaches associated with migraine, skull fractures, disturbances of the cerebrospinal fluid system, hypertension, and diseases of the eye. Many readers will appreciate the suggested plan of examination and the summary of differential diagnosis. This book has several faults often noted in contemporary medical literature. One is the misuse of abbreviations. The letters "NNR" on page 51 evidently do not mean "New and Nonofficial Remedies," but, after wasting time to discover what they do mean, the reader is likely to go on to something else. The same holds true with "HVL" and "DHE." Curiously, on page 51, the author uses "CCC" and explains that this means 'carbaminoylecholin-chlorid', since the term is not used again, it is not clear why the abbreviation was used. There is no distinction between proprietary drugs and chemical compounds in the sections on therapy. This greatly reduces the scientific value of the text and increases the difficulties of foreign readers. The author does not adduce critical evidence for the value of suggested modes of treatment, and, since he rarely mentions dosages, it must be assumed that he does not take this aspect of his subject seriously. Except for these faults, the book shows an excellent command of the subject. A bibliography of about 200 references is included.

Erwin Frink Smith: A Story of North American Plant Pathology. By Andrew Denny Rodgers III. Memoirs of American Philosophical Society held at Philadelphia for Promoting Useful Knowledge. Volume 31. Cloth \$5. Pp. 675 with four photographs. American Philosophical Society. Independence Sq. Philadelphia 6. 1952.

This volume presents a detailed and well-documented account of the scientific accomplishments of Erwin Frink Smith, who developed the laboratory of plant pathology of the United States Department of Agriculture and directed its activities from 1886 to 1927. Dr. Smith can truly be considered the dean of American plant pathologists. Under his leadership, many plant diseases of great economic importance were brought under control, and his fame as a research pathologist was widely acknowledged in this country and abroad. Dr. Smith was a strong believer in the essential similarity of pathological processes in plant and animal tissues. His viewpoint that the plant cancers, which he believed were caused by parasitic organisms, were similar in behavior to malignant lesions in animals attracted the attention of many prominent contemporary clinicians and students of cancer. Thus, while this extensive biography is of interest primarily to students of the botanical sciences, it is also of interest to medically oriented readers, particularly those interested in the trends of cancer research during the early decades of the century.

Ophthalmic Pathology: An Atlas and Textbook. By Jonas S. Friedenwald et al. With editorial assistance of Helen Knight Steward. Published under joint sponsorship of American Academy of Ophthalmology and Otolaryngology and Armed Forces Institute of Pathology. Cloth \$18. Pp. 489 with 240 plates. W. B. Saunders Company. 218 W. Washington Sq. Philadelphia 5. 7 Grape St. Shaftesbury Ave. London, W.C.2. 1952.

The Registry of Ophthalmic Pathology, oldest of the American Registries of Pathology of the Army Medical Museum (now the Armed Forces Institute) is the largest and most inclusive collection of ophthalmologic pathological material in existence. This vast reservoir of specimens has been utilized in the preparation of this volume. An outstanding

group of authorities collaborated in its production. The volume is an outgrowth of the "Atlas of Ophthalmic Pathology" by DeCoursey and Ash. The authors, utilizing Friedenwald's "Pathology of the Eye" as a basis for the text, have succeeded in producing an authoritative treatise. The text is accurate, adequate, and well written, so that it can be read easily and is of interest to the novice as well as the trained pathologist. There are chapters dealing with anatomic and physiological considerations, histology, growth and aging, nature and mechanism of inflammation, endophthalmitis and phthisis bulbi, focal lesions in endogenous endophthalmitis, granulomatous inflammations, injuries, hereditary and degenerative diseases, and tumors, in addition to chapters on each of the anatomic subdivisions of the eye and orbit. There are many well reproduced photomicrographs illustrating each topic. It is regrettable that they are reproduced in black and white instead of color, but this is not a serious deficiency. The illustrations have been placed at the conclusion of each chapter, an arrangement that has some disadvantages for the casual reader but is no serious handicap to the serious student.

Qualitative Analysis and Analytical Chemical Separations. By Philip W. West. Ph.D. Professor of Chemistry. Louisiana State University. Maurice M. Vick. Ph.D. Associate Professor of Chemistry. Louisiana State University. and Arthur L. LeRosen. Ph.D. Cloth \$3.75. Pp. 223 with 12 illustrations. The Macmillan Company. 60 Fifth Ave. New York 11. 1953.

For the first time since 1850, a scheme of analysis is presented that does not require the use of hydrogen sulfide. Laboratories in which hydrogen sulfide is not used will be cheaper and safer to operate, the new analytical scheme is easy to learn, and modern techniques for identifying specific ions are employed. The book is both a laboratory manual and an exposition of the theoretical aspects. The instructions are easy to follow, the questions to be answered in the laboratory notebook provoke study of the relevant theory, and the sections dealing with theory are clearly written. Although budding chemists will profit by being taught from this book, the authors had in mind the large number of students for whom qualitative analysis is a required subject, including students of nursing and medicine. Many features will make the material useful for the instructor as well as for the student: all the reagents required are listed, the table of atomic weights is on the inside front cover, a log table is on the inside back cover, and there is an adequate index. The relatively low price of the book is partly due to the use of paper of only fair quality, and, consequently, if the laboratory manual were soiled by chemicals, the financial loss would not be great.

Understanding Stuttering. By A. B. Gottlob. Ph.D. Director. Los Angeles Speech Correction Clinic. Los Angeles. Cloth \$5.50. Pp. 274 with 4 illustrations. Grune & Stratton Inc. 381 Fourth Ave. New York 16. 1953.

The speech organs and speech production are reviewed. Psychological factors contributing to the production of stuttering and the theories explaining this phenomenon are presented. The greater portion of the book describes methods of evaluating and treating the person who stutters and includes consideration of the patient's family and other environmental factors. The book is written by an educator and should be of value to teachers of speech correction. It is not a source of medical information for purposes of differential diagnosis and psychiatric care.

Pheochromocytoma and the General Practitioner. By Joseph L. DeCoursey. M.D. and Cornelius B. DeCoursey. M.D. Cloth. \$4. Pp. 165. DeCoursey Clinic. Cincinnati 2, 1952.

This small book presents pheochromocytoma as a "great mimic" and emphasizes the fact that tests for the tumor should be made on each patient with hypertension. An interesting historical résumé initiates the text, and after this the author presents the clinical problem of the tumor and discusses case histories, pathology, physiology, symptoms, diagnosis, and treatment. There are 361 references. The book will familiarize the general practitioner and the student with this rare but important problem.

QUERIES AND MINOR NOTES

CATARACT IN OCTOGENARIAN

TO THE EDITOR—*A man, aged 81, in good physical condition, has a mature cataract in the right eye and 20/30 corrected vision in the left eye owing to an incipient cataract. The condition has remained unchanged for seven years. Tension in the right eye is slightly below normal and the retina is still functioning, according to light perception tests. The patient wants unilateral or bilateral cataract surgery done to improve reading vision. A competent ophthalmologist has advised against cataract surgery. Could any benefit be derived from it?*

M.D., Texas

This inquiry was referred to two consultants, whose respective replies follow—Ed

ANSWER—If the slow and unsatisfactory reading vision of this patient's left eye can conclusively be shown to be due to the incipient cataract and not to a senile macula degeneration and if reading means a great deal to the patient, a cataract extraction on the right eye would seem indicated, in the hope that this would give the patient the reading vision he desires. A lens extraction on the left eye is not recommended, since for general use (by an octogenarian) 20/30 vision obtained with a slight correction is more practical than 20/20 or 20/15 vision with an aphakic correction.

ANSWER—It is possible that single binocular vision with correction for bilateral aphakia could be obtained after removal of cataracts from both eyes. In that case, the patient probably would enjoy more comfortable reading vision. Removal of the mature cataract from the right eye only would not permit single binocular reading vision and, of course, would be of no benefit. In this case, the uncertainty of restoration of good visual acuity in the right eye, even with the satisfactory light projection tests, and also the hazard of loss of reading vision in the left eye by cataract operation must be considered. Since the patient is able to read with one eye even though slowly, it is best, at his age, to advise against cataract surgery.

CHICKENPOX

TO THE EDITOR—*Are children recovering from chickenpox not considered infectious, and are they routinely allowed to return to school, even though they are still covered with pustules?* Chancellor H. Whiting, M.D., Oneida, N. Y.

ANSWER—According to "Control of Communicable Diseases in Man," which is a report of the Committee of the American Public Health Association (ed 7, 1950), the period of communicability of chickenpox is designated as "probably not more than one day before nor more than six days after the appearance of the first crop of vesicles. The rules and regulations for the Control of Communicable Disease, revised Aug 1, 1952, and enforced throughout Illinois, issued by the Illinois State Department of Public Health states that "isolation is required for not less than seven days after the appearance of the eruption." Chickenpox lesions are characterized by macular vesicles that appear in crops. They rarely become pustular, but dry up and form scabs. It is believed that the usual skin lesions that remain for seven days from the onset of the eruption are not infectious.

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address but these will be omitted on request.

TREATMENT OF POLYCYTHEMIA

TO THE EDITOR—*What is the status of treatment of polycythemia by means of radioactive substances? Are there any dangers connected with this therapy? Would you advise radiation prior to treatment with radioactive substances?*

M.D., Illinois

ANSWER—Polycythemia vera can be treated successfully with radioactive phosphorus (P^{32}). The material can be given intravenously or by mouth. The average dose is 3.5 to 4 mc, given intravenously or 5 to 6 mc given by mouth. If the red blood cell count does not decrease in a few weeks more radioactive phosphorus may be given. Hundreds of patients have been treated with radioactive phosphorus with good results. The dangers of use of radioactive phosphorus are the same as those with any other form of irradiation (spray or spot), i.e., depression of the bone marrow causing hypoplasia of any or all of the formed elements. Lawrence points out, however, that the incidence of thrombocytopenia or aplastic anemia is no greater than occurs in the natural course of the disease. Since the use of radioactive phosphorus is a form of irradiation, preliminary x-ray therapy is not necessary and is in fact undesirable. According to Lawrence, the use of phosphorus gives much better results and is at least as safe as spray or spot irradiation, however, other authorities consider use of radioactive phosphorus merely another type of irradiation therapy, and at least one authority believes it is more dangerous than other methods, such as phlebotomy.

PAINFUL HEEL

TO THE EDITOR—*A 65-year-old housewife has had constant, severe pain in the weight bearing area of her right heel for eight months. Physical examination reveals nothing except slight obesity and localized tenderness over the weight bearing area of the os calcis. Treatment with protective padding in the shoes, salicylates, and a series of four local injections of procaine and hyaluronidase has been ineffective. Roentgenograms of the area are completely normal as are results of routine blood studies and urinalysis. The patient's general health is good. I would appreciate your comments.*

Herbert H. Kersten, M.D., Fort Dodge, Iowa

ANSWER—Pain in the heel usually occurs at the site of the plantar fascia on the os calcis. This is the result of tension on the plantar fascia. An inflammation arises at the calcaneal attachment of the fan shaped plantar fascia. In the earliest stages this inflammation is painful but shows no changes on roentgenograms. Periostitis may be present, with negative roentgenographic findings. When deposits occur, roentgenograms will show thickening and formation of a spur. The longer inflammation is present the more evident is spur formation. The tension on the plantar fascia is the result of the lowering of the longitudinal arch, secondary to foot strain. Foot strain is the result of prolonged standing, and excessive weight is a factor. Correction by means of adhesive strapping, felt pads, and corrective shoes is indicated.

SWELLING OF FEET IN HOT WEATHER

TO THE EDITOR—*What is the explanation for swelling of the feet and legs in a man who usually lives in the temperate zone but who occasionally pays a visit to a semitropical country? Many persons seem to have this trouble during vacation in southern regions.*

D. A. MacGregor, M.D., Wheeling, W. Va.

ANSWER—Swelling of the feet and occasionally the legs is commonly observed in persons who travel from temperate to tropical regions. This phenomenon also occurs, especially in women, in temperate regions during the summer. It has been suggested that the swelling is related to the increases in the vascular bed and in vascular pressure in the feet that have been observed to occur in an environment of heat.

NEPHROTIC SYNDROME IN CHILD

TO THE EDITOR—A 3 year-old boy has generalized edema and a blood pressure of 118/90 mm Hg. Urinalysis showed 4+ albumin, a few white blood cells, no red blood cells, no sugar, and a specific gravity of 1.030. Results of laboratory studies done two days after the urinalysis were as follows: blood nonprotein nitrogen level 35 mg per 100 ml, serum cholesterol level 595 mg per 100 ml, serum protein level 4.04 gm per 100 cc, serum albumin level 2.31 gm per 100 cc, serum globulin level 1.73 gm per 100 cc, and albumin-globulin ratio 1.21. Results of reexamination one week after the original visit were essentially the same, except for an increase in edema with probable ascites; the child did not, however, appear or act sick and was content to play as usual. Two weeks after the original visit, the condition was essentially unchanged. The patient was placed on a high protein, low sodium diet, and rest was advised. The past history is essentially normal, except for the occurrence of intermittent angioneurotic edema over the past several weeks with reddened maculopapular discrete areas, which often appear and disappear within a few hours. Does this child have a nephrotic syndrome or a nephrotic phase of glomerulonephritis?

M.D., Washington, D.C.

ANSWER—This child probably has a nephrotic syndrome, possibly on an allergic basis, in view of the history of angioneurotic edema and skin rash. Careful inquiry should be made regarding administration of drugs during this period. Food sensitization has not been implicated as a cause of nephrosis. If signs of hypersensitivity recur, the use of corticotropin or cortisone would be indicated for this reason as well as for the control of nephrotic edema. The prognosis is good if the edema can be mobilized and if nutrition is maintained and the child is protected against infections by the prophylactic use of antibiotics. About half of the children with nephrosis recover completely after a variable course of remissions and relapses. The prognosis becomes much poorer if signs of glomerulonephritis, i.e., hematuria, hypertension, and renal functional impairment, develop.

BLOODLESS PHLEBOTOMY

TO THE EDITOR—I would be grateful for information on the tourniquet method for doing bloodless phlebotomy, including the exact place to apply the tourniquet, tightness in using it, length of time to leave it in place and possible hazards.

Anna W. Perkins M.D., Albany County, N.Y.

ANSWER—Blood pressure cuffs are applied to all four extremities at the torso. The cuff pressure is raised to about 70 mm Hg (just below diastolic pressure) and is maintained at this level for 15 minutes; the cuff pressure is then dropped to zero for one minute. The pressure may be reapplied several times. Towels or rubber tubing may be used as tourniquets if blood pressure cuffs are not available, although it is not possible to gauge the pressure with them. Experiments on man suggest that as much as 15% of the blood volume of the torso and head may be trapped by this maneuver. Some fluid will also transude out of the vascular tree. If peripheral edema is present, the degree of transudation will be limited. If relief is forthcoming, it will appear within a few minutes. Respiration may become freer, and the patient will be less excited. Pulmonary rales and wheezing may be greatly relieved, with the alleviation of cyanosis and, sometimes, slowing of the heart rate. Arterial blood pressure may fall in some cases, and, rarely, a shock-like state may appear. The bloodless venesection technique may be of value in the emergency treatment of acute pulmonary edema or paroxysmal cardiac asthma. Physiologically, bloodless venesection can be only considered as a stopgap, since it removes fluid from the systemic veins and pulmonary vessels only to store it in the limbs. The tourniquets must be released eventually, and the fluid will again engorge the veins and pulmonary vessels, unless measures are taken to strengthen the heart (use of digitalis) or otherwise relieve the congestion (use of diuretics or direct venesection).

INTRAVENOUS GLUCOSE SOLUTION INFUSION

TO THE EDITOR—How much greater dehydrative effect will be produced by a 10% solution of glucose in distilled water than by a 5% solution, assuming that the rate of intravenous infusion is 50 to 75 drops per minute?

M.D., Illinois

ANSWER—In a study conducted a number of years ago, no dehydrative effect was produced by an injection of either 10% or 5% dextrose in water, about 3,000 cc being given intravenously at the rate of 300 to 500 cc per hour. With the 5% dextrose solution, 80% of the patients had glycosuria, but, on the average, only 3 gm of sugar per day were recovered in the urine. With the 10% dextrose solution, all the patients were glycosuric, but the urine sugar loss averaged only 18 gm per day. The latter solution is, therefore, of distinct value when more calories are needed, as in cases of undernutrition or damaged liver requiring support. The caloric value per day of the 10% solution was almost double that of the 5% solution, and for this reason it is valuable.

BRUCELLOSIS IN COWS

TO THE EDITOR—A farmer owns several cows, one of which lost a calf owing to Bang's disease. A veterinarian vaccinated the cow and quoted literature from a vaccine company stating that vaccination would cure the cow and that her milk would no longer be infectious. Is this true? I realize that vaccination may prevent other cows from acquiring a *Brucella* infection, but would it cure an active case? Would compulsory testing or compulsory vaccination before a cow can be sold be preferable as a state-wide measure?

James W. Davis, M.D., Leonard, Texas

ANSWER—If the cow in question was affected with brucellosis (Bang's disease), vaccination would be of little, if any, benefit to her. It would not destroy the infection in her system, and it would not make her milk less likely to be infectious. The noninfected animals in a herd usually can be protected against the infection by proper vaccination, but the dangerous feature in vaccinating cows is that, although they may have had a negative reaction, they may be in the incubative stage of the disease and would not be benefited. When tested, a vaccinated animal will show the same reaction as an infected animal, except that, after several months, the reaction titer of the vaccinated animal will gradually fall and eventually (after two or three years for an adult) may disappear. Testing plus vaccination of heifers before sexual maturity (at 6 to 8 months of age) constitutes the best program.

ADAMANTINOMA OF MANDIBLE

TO THE EDITOR—What is the best therapy for a slow growing adamantinoma of the mandible? Is x-ray or radium therapy indicated? What is the prognosis?

M.D., Indiana

ANSWER—Adamantinomas of the mandible are slowly growing, expansive tumors, which, if untreated, reach a large size and may eventually invade through the bone, the soft tissue of the cheek, or floor of the mouth. Repeated recurrence after inadequate treatment is common, but metastasis to lymph nodes or lungs is extremely rare. Histologically, the characteristic cells are stellate cells and cylindrical cells arranged to resemble the structures of the enamel forming organ, however, marked variations are seen, and often the pattern resembles that of a basal-cell, glandular, or epidermoid carcinoma. Neither these histological variations nor the predominance of a solid or cystic type of growth are of prognostic significance. The best treatment is surgical resection of small lesions with an adequate surrounding margin of healthy bone. For extensive lesions, resection of the jaw is necessary. X-ray or radium therapy is of little value either as a primary method of treatment or as a supplementary measure preoperatively or postoperatively. The only factor that seems to have any real influence on the final outcome is the radicality of the initial surgery. For patients treated by adequate resection, the prospect of cure is excellent.

ANNUAL PHYSICAL EXAMINATIONS

TO THE EDITOR—*I note in Queries and Minor Notes in THE JOURNAL Feb 21, 1953 page 695, the inclusion of a guaiac test on a stool specimen as part of the recommended and standard procedure in an annual physical examination. It is presumed that Dr Kistler, who made the inquiry is a private physician and is asking for guidance in the performance of annual physical examinations on office patients. While, if the candidate for such annual survey can be hospitalized and food and fluid intake controlled for at least 48 hours prior to the laboratory procedure, a guaiac test may have diagnostic significance, I would doubt that any inferences should be drawn from such a procedure when performed on an ambulatory office patient whose diet is unknown and uncontrolled. This point may lead to grievous errors in interpretation and to many scares for patients whose positive guaiac test can be accounted for on physiological grounds. Another possible cause for false positive results in the guaiac test is any bleeding in the upper or lower respiratory tracts or in the mouth, when the bloody residue has been swallowed.*

Albert Groves Hulett, M.D.
20 Hawthorne Ave
East Orange, N J

TO THE EDITOR—*In reply to a query in THE JOURNAL Feb 21, 1953 concerning laboratory procedures in the annual health examination, it was stated, 'If studies of blood chemistry are desired, nonprotein nitrogen and blood sugar determinations may be made, these should be obtained when the patient is in a fasting state.' Elevation of the fasting blood sugar level does not occur until diabetes is well developed. Because it is thought that detection and treatment in the early and symptomless stage of diabetes can prevent or retard further deterioration and the development of the degenerative complications the American Diabetes Association and its local branches are stressing the importance of early case detection as a preventive measure. The detection of minimal degrees of impairment of sugar tolerance requires the use of a loading test. The simplest form of such a test is a blood sugar level determination made during the absorptive period after a high carbohydrate meal. I prefer a standardized technique in which the determination is made one hour after a 100 gm carbohydrate breakfast, but for general purposes the blood sugar level may be determined from one half to one and one-half hours after any meal containing a liberal amount of starchy and sweet foods. A blood sugar value over 150 mg under these conditions means definite impairment of tolerance, and any value over 130 mg should call for repetition of the test at intervals for further evaluation. Such a test is more physiological and simpler than the customary glucose tolerance test and is a better guide to the degree of dietary restriction required to prevent hyperglycemia. When a blood sugar level determination is not feasible, glycosuria after such a loading meal may be used as a rough screening test. The urine test is less informative than the blood sugar test, since some subjects with elevated renal glucose thresholds will escape detection, but it is more informative than determination of the fasting blood sugar level with which all but well-developed cases of diabetes will be missed. One of these tests should be included in the annual health examination. While a nonprotein nitrogen level determination is seldom indicated in the absence of evidence or history of renal disease, it may be performed on the same sample of blood, since the preceding meal will not affect it significantly.*

Henry E Marks, M.D., Chairman
Committee on Diabetes Detection
New York Diabetes Association
121 E 60th St., New York 22

TO THE EDITOR—*In THE JOURNAL Feb 21, page 695, is a query concerning annual physical examinations and associated laboratory work. If the country were populated by unemployed laboratory technicians the advice would be splendid, unfortunately technicians are scarce and their time*

must be conserved. Particularly, I refer to the red blood cell count, which is considerably less accurate and more time consuming than the hemoglobin determination and is of no value in the face of a normal hemoglobin level. This is so evident that most hospitals do admission red blood cell counts only if the hemoglobin level is abnormal, thus utilizing skilled labor most effectively. I also doubt the value of routine leukocyte counts or differential counts in normal persons, because these so often reflect transient illnesses of no particular significance, of electrocardiograms except in older persons, and of guaiac tests on stools. To complete the roster, the fasting blood sugar level is not likely to yield useful information if the urine is free of sugar, nor is the nonprotein nitrogen level often elevated in persons with a negative history, normal urine, and normal blood pressure. It is advice of this kind that makes medical care more expensive but not more valuable.

Roy N Barnett, M.D.
Strawberry Hill Ave
Norwalk, Conn

Dr Barnett's letter was referred to the consultant who answered the original inquiry, and he replied as follows—Ed

In this consultant's opinion, the original query was presented as an honest desire on the part of the practitioner to meet his responsibility to his patient, said patient having presented him self to his doctor, wishing to know whether he is in good health or whether some early signs or symptoms of disease exist unknown to him. Such a case offers a distinct challenge to the conscientious physician and warrants the expenditure of time and such expense as may be indicated, for it is here, in the practice of preventive medicine, that the physician can frequently offer most to his patient. To attempt to answer this letter in detail would be futile. A few well known facts may suffice to justify my recommendations. 1. A normal hemoglobin level may mask an early macrocytic anemia. 2. A routine leukocyte count may disclose an unsuspected, significant leukocytosis or even leukemia, "transient illness" may or may not be significant, and if found its true diagnosis should be established. 3. Coronary artery disease is not the exclusive property of older persons, congenital lesions and damage from rheumatic fever may leave significant alterations in electrocardiographic patterns. 4. The presence of a high renal threshold is not rare, and, conversely, renal glycosuria is not rare, thus the routine urinalysis may lead to false presumptions. 5. A positive guaiac reaction on the stool or material from the examining finger following a digital examination may give the clinician the very clue needed to develop subsequently the diagnosis of an early gastrointestinal neoplasm. All these studies could be eliminated by the clinician, and the cost to the patient for the examination would subsequently be reduced, but the value received would be of like measure "Caveat emptor!"

DISINFECTION OF BLOOD-CONTAMINATED LANCETS

TO THE EDITOR—*I should be obliged if you would rectify an error that appeared in THE JOURNAL Sept 15, 1951, page 288. The statement is made that Dr A J Rhodes and I recommend the disinfection of syringes by immersion in chemicals. This is wrong, as the following references will reveal.*

The second reference advises boiling of syringes and refers to the worthlessness of the procedure of washing syringes in distilled water and storing them in spirit.

EARLY DIAGNOSIS OF PRIMARY MALIGNANT BONE TUMORS

G Edmund Haggart, M D

and

Joseph W Copel, M D, Boston

Primary malignant bone tumor is a comparatively rare condition, as shown by a survey in Massachusetts¹ in which the incidence of bone sarcoma was about 1 in 100,000 of the population at a given time. Phemister² has stated that of all sarcomas, sarcoma of bone occurs most frequently, and according to the statistics compiled by Christensen³ the highest incidence of bone sarcoma is found in the 15 to 20-year-old age group.

As is the case with any malignant process, the sooner a definitive diagnosis of neoplasm of bone is made, the earlier adequate treatment can be instituted and, consequently, better results obtained. It is imperative, therefore, that the physician always have in mind the possibility of a primary malignant bone tumor, especially in view of the fact that the clinical picture of bone neoplasm is variable and does not offer a characteristic history or physical findings. Intermittent to continuous pain, particularly if it is present when the patient is at rest, is the most significant symptom and usually precedes any objective evidence of the new growth. Occasionally, when the lower extremity is involved, a limp will appear before there is any pain. The character of the pain varies from a recurrent, rheumatic type of discomfort to a relatively sudden, intense pain. When it has become severe enough to produce disability the patient usually seeks medical advice.

The evidence of trauma as a pathogenic factor remains uncertain, as pointed out by White and Elkin⁴ in a survey of 88 proved cases of primary malignant bone tumors. Sixty-four patients could recall no injury. In 24 persons, the injury appeared to be relatively trivial and of questionable relationship to the onset of bone disease. On the other hand, Coventry⁵ expressed the opinion that trauma, which so frequently occurs about the knee, may be a deciding factor in the production of malignant bone tumors, because in 75% of cases of osteogenic sarcoma seen at the Mayo Clinic the lesions were located either

in the lower end of the femur or in the proximal portion of the tibia and fibula.

The observations of clinical examination vary widely. In instances in which the tumor arises from the periphery of the underlying bone and grows rapidly, there may be definite local swelling with enlarged veins in the skin over the surface of the lesion. In a malignant bone tumor of more central origin, there is less evidence of swelling, and the tumor may not be discovered even by very careful palpation. Unless the new growth has been present for some time, the overlying soft parts usually are not adherent. These early, mild symptoms of pain and of minimal disability may account for the patient's delay in seeking medical advice. Once the patient has done so, however, the physician should regard persistent bone, joint, or muscle pain, in the absence of significant trauma, as a possible symptom of bone tumor and should institute further studies beginning with a roentgenogram of the affected area. Awareness of this possibility on the part of the examining physician will improve the prognosis as well as prevent the all too frequent diagnoses of arthritis, rheumatism, sprain, neuritis, and bursitis, with the subsequent long delay before a correct diagnosis is established.

Significant information is furnished by roentgenograms, not only of the bone or bones at the site of symptoms but also of the lungs if the initial films show a bone lesion. One of the most difficult diagnoses is that of distinguishing a primary malignant tumor of bone, such as Ewing's tumor (hemangioendothelioma), from an inflammatory process. This differentiation has become even more complex since the advent of the antibiotics, the use of which is considered to be the reason why osteomyelitis of the acute, fulminating type is now so rarely seen. Bone changes in acute osteomyelitis are not evident roentgenographically for 10 to 14 days after the onset of illness, but delay in the diagnosis has been

appreciably reduced as a result of the soft tissue studies reported by Baylin and Glenn.⁶ They demonstrated that loss of intramuscular planes and loss of the fat shadow beneath the subfascial plane may appear as early as 24 hours after the first clinical symptoms. They further stressed the fact that edema of soft tissue is apparent throughout the length of the bone in acute osteomyelitis, whereas in tumor and also in trauma, edema is usually confined to localized areas. Traumatic lesions such as subperiosteal hematoma or myositis ossificans may be confused with a bone tumor. It is also important to distinguish a fracture that is the result of trauma from a pathological fracture subsequent to a preexisting bone neoplasm, particularly since any such bone tumor may result in a pathological fracture.

We believe that in the majority of cases of primary malignant bone tumors a correct diagnosis can be made on the basis of a careful history, complete physical examination, essential laboratory studies, and roentgenograms. The minimal laboratory examination should include urinalysis, estimation of hemoglobin concentration, complete blood cell count and differential, Wassermann reaction, erythrocyte sedimentation rate, and serum phosphatase level. On the other hand, we are equally certain that surgical biopsy should be performed on all patients before a decision is made regarding the type of treatment. In the majority of cases, needle biopsy is performed, and the microscopic appearance of the biopsy specimen is interpreted by pathologists who are experienced in the diagnosis of bone tumors. This technique is not aspiration biopsy but involves the use of a special needle that, as noted by Rix and Brooks,⁷ permits the excision of a tissue specimen large enough to be examined by standard laboratory procedures and, therefore, presenting no unusual problem in microscopic diagnosis. When there is a soft tissue mass overlying the bone and in many of the cartilaginous tumors, the Silvermann needle is effective, while with those tumors more centrally situated in the medullary area, a trephine needle, as described by Turkel and Bethell,⁸ is utilized. Under the fluoroscope, the tumor area is identified and the position of the needle point determined to make certain a specimen of the bone lesion is obtained. With this needle biopsy technique we have not observed resulting hemorrhage or evidence of seeding within the needle track. As soon as a plug of tissue is procured it is placed on a small circle of sterile filter paper and floated in 100 cc of Zenker's fluid to which 10 cc of glacial acetic acid has been added. This procedure fixes the specimen of tissue in one mass and so permits adequate microscopic examination. In an occasional instance when definitive tissue is not obtained, an open biopsy is performed and the wound carefully closed in layers without drains.

We have had no experience with arteriography as described by dos Santos,⁹ because our method of exami-

nation has proved so satisfactory, however, arteriograms could indicate the extent of the neoplasm by outlining the limits of vascular activity beyond the margin of cellular infiltration and could also be used to assess the effects of irradiation on malignant bone tumors.

It is important to remember, as emphasized by Coventry,⁵ that a completely accurate diagnosis of tissue section is not possible for several reasons: 1 The tumor may have been previously irradiated, and this therapy may cause change in the structure and appearance of the cells, as is so well demonstrated in cases of Ewing's tumor. 2 Previous removal of a biopsy specimen for study may have resulted in infection or hemorrhage, or both, which markedly confuse the microscopic picture. 3 The surgeon may not obtain a representative section of the tumor. 4 The pathologist may incorrectly interpret the appearance of the tissue.

The pathologist also provides valuable information in addition to a report on the type of tumor cell when he records that the tumor is of low-grade malignancy, relatively average, or even of high degree of malignancy. These data are significant factors in the decision as to the type of treatment, because, in a low-grade malignant condition, serious consideration can be given to a more conservative type of operation than would be contemplated if the pathologist reported a tumor of average or high degree of malignancy. Meyerding and Valls¹⁰ state that life expectancy and results of treatment are influenced by the grade of malignancy, and we agree that the prognosis for five-year survival is considerably better in the presence of low-grade malignant tumors.

CLASSIFICATION OF PRIMARY MALIGNANT TUMORS OF BONE

Osteogenic Sarcoma—Jaffe¹¹ believes that the group of osteogenic sarcomas should be subdivided into recognized components, such as true osteogenic sarcoma, fibrosarcoma, and chondrosarcoma. This view is supported by Coley and Harrold,¹² as both fibrosarcoma and chondrosarcoma metastasize at a later stage of the disease than does true osteogenic sarcoma. From the standpoint of follow-up study, however, all of these forms can be classified under one broad, general heading of osteogenic sarcoma. In the osteogenic group, as indicated by Hanelin and Robbins,¹³ there is usually evidence of a lesion, which may be either destructive or sclerotic, within the bone. Fibrosarcoma may be evident as an area of destruction in cortical bone with unossified soft tissue extension, while chondrosarcoma often begins as a central lesion, grows slowly, and, whether central or otherwise, tends to retain its original growth tendency. Furthermore, osteogenic sarcoma and fibrosarcoma usually occur in persons in the 10 to 25-year-old age group, whereas chondrosarcoma is oftener detected in persons in the 25 to 50-year-old age group.

Ewing's Tumor—Ewing's tumor continues to be a particularly difficult diagnostic problem. While syphilis has been called a great imitator of constitutional disease, as pointed out by McCormack, Dockerty, and Ghormley,¹⁴ Ewing's sarcoma can be as aptly characterized as the great imitator of bone pathology. Many conditions, both neoplastic and inflammatory, are known to produce changes indistinguishable roentgenographically from

those evoked by Ewing's tumor. Accurate histological evaluation of Ewing's tumor is complicated further by (1) the rarity of the neoplasm, which has made it almost impossible for one person to study and compare a large number of lesions, and (2) employment of therapeutic irradiation as a basic factor of diagnosis in lieu of surgical biopsy. When this latter course has been adopted, and regrowth of the neoplasm follows irradiation, the cytological picture is often so altered as to make it almost unrecognizable. The majority of these tumors are encountered in patients from 12 to 19 years old. McSwain, Byrd, and Inman¹⁵ reported 20 Ewing's tumors in a group of 192 primary neoplasms of bone. Of these 20 patients, only 3 lived five years or more without a recurrence. In a further study, they found a 9% survival rate in an analysis of 565 cases of Ewing's tumor collected from previously published reports.

Hemangioendothelioma usually occurs in the middle of the shaft of a long bone, begins in the medullary cavity and destroys bone, but its cells never produce bone. On nearing the surface, it frequently stimulates the periosteum to form layers of new bone, commonly referred to as "onion skin" formation. This is not diagnostic. When an unequivocal diagnosis is made, it is our belief that roentgen therapy without severe injury to adjacent normal tissue offers the best prognosis, particularly since the advent of rotational 2 million volt treatment. The therapy is administered not only to the original bone lesion but also to the regional lymph nodes, as well as to the mediastinum and the lungs.

Multiple Myeloma—The majority of multiple myelomas occur in adults over 50 years old. The possibility of this tumor should always be suspected in elderly patients who have vague abdominal complaints and unexplained back pain. The roentgenograms frequently show a degree of osteoporosis, and there may be a compression fracture of an involved vertebra. The alkaline phosphatase and erythrocyte sedimentation rates are elevated. Definitive diagnosis can be made by biopsy of the bone marrow in many of these cases. As noted by Bayrd and Heck,¹⁶ multiple myelomas progress slowly but steadily. The prognosis varies markedly in proportion to the type of plasma cells found in the bone marrow. If the cells are of adult type, the disease may prove to be chronic and fatal only after some months or even years. On the other hand, if cells are young and poorly differentiated the disease is rapidly progressive and fatal. No specific therapy has been found to control this tumor, although in recent years the use of urethan has proved helpful, especially in the more chronic type of involvement.

Giant Cell Tumor—Giant cell tumor is now recognized as a true tumor of bone and is sometimes malignant. It occurs most frequently in patients between the ages of 20 and 30 years. The tumor usually extends to the end of a long bone, and roentgenograms show an expansile destruction or "soap bubble" type of lesion. Surgery is the treatment of choice, but if the lesion is not accessible, roentgen therapy is of definite value. Leucutia and Cook¹⁷ studied 77 cases of benign giant cell tumor and state that 7 of these tumors (9%) underwent malignant change. In an extensive survey of the literature, they found that malignant degeneration of giant cell tumor

occurred in a limited number of cases (10 to 15%) regardless of the type of treatment given.

Reticulum Cell Sarcoma—Reticulum cell sarcoma is usually a solitary lesion most frequently found in long bones but without significant localization in a given bone, as pointed out by Sherman and Snyder.¹⁸ Destruction of bone is more evident than growth changes, the bone cortex being destroyed without evidence of expansion or thickening. The lesion if untreated grows rapidly but retains its initial characteristics. Coley, Higinbotham, and Groesbeck,¹⁹ in a detailed study of 37 cases of proved primary reticulum cell sarcoma of bone, found that the disease was commoner in males, three-fourths of whom were in the second, third, and fourth decades. The course of this tumor is less destructive than that of any other malignant tumor of bone, and the roentgenologic evidence of a high degree of response to irradiation is constant. Furthermore, accessible metastases also respond to irradiation therapy, especially when the tumor spreads into regional lymph nodes.

CONCLUSIONS

The physician who sees a patient with persistent bone, joint, or muscle pain, especially when the involved part is at rest, should always keep in mind the possibility of a primary malignant tumor of bone. This possibility demands evaluation of a thorough history, careful clinical examination, laboratory studies, roentgenograms, and biopsy. The combined efforts of the surgeon, the roentgenologist, and the pathologist are necessary in order that the most effective therapy may be employed. Every effort must be made to reduce markedly the time lag between the initial consultation and the time when a bone lesion is suspected, since it is obvious that the earlier the diagnosis is made and proper treatment instituted the more assurance there is of a favorable outcome.

Disseminated Lupus Erythematosus—Acute disseminated lupus erythematosus is a systemic disease in which anatomic lesions are found predominantly in the kidneys, heart, spleen, and lungs. Any organ may be involved, particularly in its vascular or supporting components. Although involvement of collagen and intercellular ground substance plays an important part in the development of many of the lesions, cellular changes, particularly in the kidneys, may occur, run their course and lead to death without demonstrable involvement of the collagen. Consequently, in the present state of knowledge it would probably be unwise to circumscribe the disease by the term "diffuse collagen disease." The occasional occurrence, in cases of acute lupus erythematosus, of glomerular lesions resembling those of glomerulonephritis and of vascular lesions resembling those of periarteritis nodosa may be suggestive but not unequivocal evidence of a similar pathogenesis for these diseases. Finally, although the appearance of many of the lesions of lupus erythematosus resembles hyperergic or allergic inflammatory reactions, one is not justified on the basis of morphologic evidence alone to consider lupus erythematosus as a manifestation of hypersensitivity.—A H Baggenstoss, M D, Visceral Lesions in Disseminated Lupus Erythematosus, *Proceedings of the Staff Meetings of the Mayo Clinic*, Oct. 22, 1952.

ISONIAZID AND STREPTOMYCIN IN THE TREATMENT OF PULMONARY TUBERCULOSIS

A PRELIMINARY REPORT

Capt Forrest W Pitts, Col Carl W Tempel, Major Frank L Miller, Capt James H Sands
 Capt Martin J Fitzpatrick, (MC), U S Army
 and
 Orman Weiser, B S, Denver

Clinical studies with isoniazid and related compounds have demonstrated antituberculous activity of high magnitude and thus confirmed results of *in vitro* and *in vivo* investigations. Particularly significant are the evaluations recorded by Selikoff, Robitzek, and Ornstein¹ on 166 patients with pulmonary and extra pulmonary tuberculosis treated with isoniazid or iproniazid alone, and those of Clark and co-workers² on 14 patients with milary and meningeal tuberculosis treated with isoniazid alone. These authors suggest that preliminary studies with isoniazid and iproniazid reveal therapeutic efficacy equal or superior to that observed with streptomycin employed singly.

Treatment of 61 patients with moderately or far-advanced pulmonary tuberculosis at Fitzsimons Army Hospital with 150 or 300 mg of isoniazid alone daily for four to eight months resulted in observations essentially in accord with the views expressed above.³ Symptomatic response was uniformly favorable and was supported by objective improvement as measured by serial chest roentgenograms in the majority of patients who had not had previous drug therapy. There was almost no drug toxicity. Fifty-three per cent of the patients in this series yielded sputum negative on culture after four months of isoniazid therapy, 67% of patients with positive cultures were found to harbor tubercle bacilli totally resistant to 1 μ g of isoniazid per milliliter, similarly, 32% were completely resistant to 5 μ g of isoniazid per milliliter.

Previous experience with streptomycin, para-aminosalicylic acid, viomycin, and oxytetracycline (Terramycin) has established that the combination of two effective antimicrobial agents produced additive therapeutic effect as well as delayed and decreased incidence of bacterial resistance.⁴ Accordingly, the combination of isoniazid and streptomycin was a logical and, as experience has borne out, desirable approach. This preliminary report is an evaluation of 99 patients treated with 150 or 300 mg of isoniazid daily combined with 2 gm of streptomycin every third day for four months. Ninety-seven of these patients have received drug therapy for six months and 77 have been observed for eight months. For

comparative purposes, data are presented on 98 patients who received 2 gm of streptomycin every third day for eight months combined with 12 gm of para-aminosalicylic acid daily.

MATERIAL AND METHODS

The 197 patients treated with the combined regimens had been hospitalized recently and had received no previous antituberculous therapy. All had moderately or far advanced pulmonary tuberculosis and cultures positive for tubercle bacilli that were sensitive to the drugs being studied prior to therapy. Streptomycin sulfate was administered in a dosage of 1 gm intramuscularly twice daily every third day to all patients. Ninety-eight patients received 4 gm of sodium para-aminosalicylate in solution three times daily, 47 patients received 150 mg of isoni-

[†] SM PAS represents streptomycin and para-aminosalicylic acid therapy.

azid daily in three divided doses, and 52 patients received 300 mg of isoniazid daily. No other therapy except bed rest was employed during the first four months of drug therapy.

The background factors are presented in table 1. The two series consisted predominantly of young white men with recent exudative, caseous pneumonic, and cavitary disease. The two groups were essentially similar except for fewer patients with far advanced disease in the group receiving streptomycin and isoniazid therapy.

Roentgenograms of the chest were obtained at monthly intervals and evaluated by a jury of no less than three physicians. The response was defined as marked, moder-

ate or slight improvement, no change, and worsening. Marked improvement referred to complete or almost complete resolution. Minimal degrees of resolution were graded as slight improvement. Worsening was defined as any degree of extension of the disease in any part of the roentgenogram even if other areas were improved. The presence of a cavity was recorded if the outline could be clearly seen on posteroanterior or lordotic films, but these findings were considered separately from the evaluation of the infiltration.

Sputum or gastric contents were cultured on every patient at intervals of two weeks on Petragnani's medium. All positive cultures were subcultured on American Trudeau Society Committee mediums containing 0, 1, 10, and 100 μ g of streptomycin per milliliter, 0, 1, 10, and 100 μ g of para-aminosalicylic acid per milliliter (for those patients receiving para-aminosalicylic acid), and 0, 0.2, 1, and 5 μ g of isoniazid per milliliter (for those patients receiving isoniazid). If growth in the tube containing 10 μ g of streptomycin per milliliter, 10 μ g of

weight during the first four months of therapy in contrast to 47% of the patients receiving streptomycin and para-aminosalicylic acid (chart). It is believed that the weight gain reflects over-all improvement in the underlying disease and that the superiority noted in the streptomycin-isoniazid series is partly accounted for by the absence of anorexia, a significant factor associated with para-aminosalicylic administration.

Röntgenographic Evaluation—Comparison of the 120, 180, and 240 day chest roentgenograms with those taken prior to drug therapy is depicted in table 2. The over-all response is unusually favorable, which is indicative of the type of disease under therapy, that is, predominantly exudative and caseous pneumonic disease of recent origin in young persons whose general condition is good. Noteworthy is the absence of roentgenographic worsening. The degree of improvement and loss of cavity from view in those patients receiving streptomycin and isoniazid therapy slightly surpassed that observed in patients on the streptomycin and para-aminosalicylic acid

para-aminosalicylic acid per milliliter, or 1 μ g of isoniazid per milliliter equaled the growth on the control tube, the organisms were arbitrarily considered resistant to the given antimicrobial agent. All cultures were sensitive to these concentrations prior to institution of drug therapy.

Patients were observed clinically for symptomatic improvement and drug toxicity. Audiogram and caloric vestibular tests were performed prior to, during, and on completion of therapy in both series. Laboratory studies were accomplished prior to drug therapy and repeated at the following intervals on all patients receiving isoniazid therapy: urinalysis weekly, complete blood count, hematocrit reading, and sedimentation rate determination every two weeks, blood urea nitrogen determination every 60 days, 15 minute phenolsulfonphthalein excretion test after 120 days, and cephalin-cholesterol flocculation and sulfobromophthalein (Bromsulphalein) tests every 30 days.

RESULTS

Symptomatic Response—All patients on both regimens manifested symptomatic improvement as measured by alterations in temperature, severity of cough, and sputum volume. Seventy per cent of the patients receiving streptomycin and isoniazid gained 5 or more pounds in

regimen, the drug therapy hitherto regarded as the program of choice in the treatment of tuberculosis.

Bacteriological Evaluation—Cultural negativity was present in 86 to 94% of the patients receiving either antimicrobial regimen four or more months (table 3). All of the patients treated with streptomycin and isoniazid are still receiving drug therapy, but 61 of the 98 patients in the group treated with streptomycin and para-aminosalicylic acid have been followed for two to eight months after therapy was discontinued. Bacteriological relapse has occurred in 12 of the latter group.

There were 27 patients who had intermittently positive sputum or gastric cultures in the interval from the fourth to eighth month of streptomycin and para-aminosalicylic acid therapy and following cessation of therapy. Sensitivity studies are pending on specimens from 2 patients, organisms from 17 are known to be sensitive to both drugs and 8 harbor tubercle bacilli resistant to either or both antimicrobial agents. Four patients yielded organisms resistant to 100 μ g of streptomycin per milliliter and 2 had organisms resistant to 100 μ g of para-aminosalicylic acid. Spontaneous reversion to para-aminosalicylic acid-sensitive organisms (1 μ g per milliliter) occurred in one instance. The remaining 2 patients had organisms

resistant to 100 μ g of streptomycin per milliliter and 10 μ g of para-aminosalicylic acid per milliliter. Thus, the known incidence of drug resistance for this period of time is 8% of the entire series, or 32% of the patients with positive cultures and sensitivity studies. Emergence of drug resistant organisms paralleled the duration of

Changes in the weight of 197 patients treated for four months with para-aminosalicylic acid or isoniazid daily and streptomycin intermittently

therapy. All 14 positive cultures obtained during the fourth month of drug therapy were sensitive to 10 μ g of streptomycin and para-aminosalicylic acid per milliliter, 2 of 7 cultures are known to be resistant after six months of treatment, and 8 of 19 cultures had drug resistant organisms after eight months of streptomycin and para-aminosalicylic acid therapy (table 3).

Of the 11 patients with positive cultures after four months of streptomycin and isoniazid therapy, 6 had cultures sensitive to both drug agents, 2 had cultures resistant to 5 μ g of isoniazid per milliliter, 1 had organisms resistant to 1 μ g of isoniazid per milliliter, and 2 had cultures resistant to 100 μ g of streptomycin per milliliter. None were resistant to both drugs. The incidence of streptomycin or isoniazid resistance after the fourth month of treatment is 5% for the entire series, or 45% of the patients with positive cultures (table 3). An evaluation of streptomycin and isoniazid resistance beyond the fourth month of therapy is not possible at this time because of the high incidence of negative cultures. There appears to be a trend to more frequent and rapid development of resistance with a streptomycin and isoniazid regimen than with the streptomycin and para-aminosalicylic acid regimen, however, this has not been a problem since resistance has developed in such a small number of patients receiving streptomycin and isoniazid. Furthermore, a third drug, para-aminosalicylic acid, was available for use. Clinical or roentgenographic relapse was not observed in any of the patients whose organisms were found to be drug resistant.

Isoniazid Toxicity—Clinical toxicity has been minimal in the dosages employed in this study. In two patients drug fever developed with temperatures up to 102 F, in one patient peripheral neuritis developed, and another had an epileptiform convulsion that necessitated discontinuance of isoniazid therapy; these cases are not included in the clinical or bacteriological evaluations. Hyperreflexia occurred in approximately 5% of the series. A few patients complained of nervousness and insomnia, which were readily controlled with small doses of phenobarbital. Increased muscular irritability and weakness

were noted transiently in four patients. Although disturbance of micturition, dryness of the mouth, euphoria, and increased sensitivity to sympathomimetic drugs have been recorded by others, none was noted in this group of patients.

An unexplained death occurred in one patient after 13 days of therapy with 300 mg of isoniazid daily combined with 2 gm of streptomycin every third day.

A 25-year old white man was first hospitalized elsewhere for pulmonary tuberculosis in 1948. An electrocardiogram at this time revealed a left bundle branch block, but there was no evidence by history or physical examination to indicate cardiac disease. A two stage, seven rib, thoracoplasty was performed on the left in January, 1949, and he was discharged from the hospital in November, 1949, with inactive disease. Reactivation of the disease in the upper lobe of the right lung with evidence of cavitation led to his hospitalization at Fitzsimons Army Hospital on Aug 6, 1952. The sputum was positive for tubercle bacilli. An electrocardiogram revealed a left bundle branch block, but there was no evidence suggestive of cardiac disease by history or physical examination. Therapy consisted of bed rest and administration of streptomycin and para-aminosalicylic acid. Para-aminosalicylic acid therapy was discontinued on Dec 29, 1952, and 100 mg of isoniazid three times daily was substituted. He was receiving no other drug therapy. On the evening of Jan 10, 1953, he suddenly complained of a "peculiar feeling" in his chest. This was followed by cyanosis, several gasps for breath, and death within several minutes. It was thought that he had sustained an acute pulmonary embolism, but postmortem examination did not confirm this belief or suggest the actual cause of death. The heart and all the vessels appeared to be normal, and no abnormality was found except active tuberculosis confined to the upper lobe of the right lung and inactive tuberculosis in the left lung. In retrospect, it is believed that cardiac arrest was the cause of death, but it is not known whether or not isoniazid therapy was a contributing or etiologic factor.

† Eight of 98 patients had positive cultures during the eighth month of drug therapy. Of the remaining 90 patients 61 have been followed 2 to 8 months after SM PAS therapy was discontinued. Bacteriological relapse occurred in 12 patients (20%). Thus cultures from 20 patients were available for sensitivity studies.

Laboratory evaluation of the renal, hematological, and hepatic systems has revealed minor and transient abnormalities. Table 4 summarizes laboratory toxicity studies noted in 85 patients who received 150 or 300 mg of isoniazid daily for 180 days, either alone or combined with intermittent streptomycin therapy. Transient al-

buminuria, which did not exceed a grade of 1+, was common in 1 to 6 of the 24 urinalyses performed on each patient during the first six months of drug therapy. Similarly, low-grade cylindruria and occasional red blood cells appeared in the urine at infrequent intervals. No

patient had abnormal retention of blood urea nitrogen and renal function remained normal as measured by the 15 minute phenolsulfonphthalein excretion test. Transient sulfobromophthalein retention occurred in 18 patients (21%) and transiently abnormal cephalin-cholesterol flocculation tests were observed in 3 (4%) of patients treated six months. These abnormalities appeared only once or twice in any given patient without any history or physical examination to confirm them. Laboratory error was suspected, but repeated studies verified the initial abnormality reported. Drug therapy was continued without modification in these patients in spite of laboratory evidence indicating disturbance of hepatic function, and spontaneous return to normal occurred in all patients. There was no disturbance of the peripheral blood cells except for low grade and transient eosinophilia (5 to 18% of total white blood cell count) in the majority of the patients.

Streptomycin Toxicity—Fifty patients have been evaluated by serial audiograms and ice water vestibular function tests during eight months of intermittent streptomycin therapy (table 5). All received streptomycin sulfate in a dosage of 2 gm every third day for six months followed by 1 gm every third day for two months. Evidence of eighth cranial nerve toxicity was observed in 16 patients (32%) but has proved to be predominantly transitory in all following cessation of therapy. Abnormalities in the audiogram appeared most frequently in

the higher tones (4,096 and 8,192 cycles per second) of hearing and in vestibular function. A striking correlation of frequency and severity of ototoxicity with the age of the patient was readily apparent. Seven of eight patients over 50 years of age had some degree of eighth cranial nerve damage, of seven patients who had marked toxicity, five were more than 50 years old. Preexisting auditory disease also appeared to be a factor in the severity of ototoxicity.

COMMENT

This study is a preliminary report on long-term regimens employing intermittent streptomycin therapy combined with daily administration of isoniazid or para-aminosalicylic acid. Limited data for evaluation are available for only eight months of drug treatment, but at this point the comparison partially favors the combination of streptomycin and isoniazid (chart and table 2). The streptomycin-isoniazid regimen appears to be somewhat more efficacious from a therapeutic standpoint, and toxicity to the new regimen has not been a frequent problem to date. Isoniazid is more easily administered than para-aminosalicylic acid, since fewer tablets are required and gastrointestinal distress is completely lacking. There is clear-cut preference for streptomycin and isoniazid by the patient and staff alike when the factors of patient acceptance and ease of administration for prolonged periods are considered. Bacterial resistance has been minimal after four months of either drug regimen and preliminary studies suggest that little difficulty will be encountered with longer periods of treatment. Complete evaluation for 8 to 12 months or more will be required, however, for final assessment of the resistance factor.

There did not appear to be any difference in the therapeutic efficacy of 300 mg of isoniazid daily and 150 mg daily. The low magnitude of drug toxicity encountered, however, employing 3 to 6 mg per kilogram of body weight, indicates that successively higher dose ranges may be investigated with safety. Optimum dosage schedules for isoniazid are yet to be determined.

TABLE 5—Evaluation of Eighth Cranial Nerve Toxicity Following Streptomycin Sulfate Therapy in Fifty Patients Treated for 240 Days

Degree of Damage*	Audiogram		Caloric Vestibular Function Test (Ice Water)	Total No of Abnormal Tests	Total No of Patients
	512-2048 Cycles/Sec. (Speech Range)	4096-8192 Cycles/Sec. (High Tones)			
Slight	3	7	3	13	6
Moderate	1	1	2	4	3
Marked	3	3	5	11	7
Total	7	11	10	28	16

* The following criteria were used for evaluation of the results of audiographic and vestibular function tests: with hearing loss of less than 10 db and nystagmus in 90 to 120 seconds no damage; with 11 to 20 db loss and nystagmus in 80 to 75 seconds slight damage; with 21 to 30 db loss and nystagmus in 74 to 60 seconds moderate damage; and with more than 30 db loss and nystagmus in 49 or fewer seconds marked damage.

On the basis of studies made to date, it can be said that the combination of intermittent streptomycin and daily isoniazid therapy represents a promising drug program for the treatment of pulmonary tuberculosis. The evidence, however, does not indicate that such a regimen of

antituberculous drugs is definitive in a curative sense, and, as with other regimens, the need for bed rest, collapse measures, and excisional surgery continues to exist. The importance of this observation is well illustrated by roentgenographic evidence of cavity closure (table 2). It is noted that cavitation was still present after six months of therapy in 54% of the patients receiving streptomycin and para-aminosalicylic acid and 37% of the group receiving streptomycin and isoniazid. Under the most favorable conditions, cavitation persists in 41% of the cases even after eight months of streptomycin and para-aminosalicylic acid therapy. Furthermore, one-fifth of all patients who completed eight months of streptomycin and para-aminosalicylic acid therapy had a bacteriological relapse following cessation of drug therapy.

Relapse following definitive drug therapy may be related to duration of treatment. No studies are available to clearly define the desired duration of drug administration, but present experience leads us to infer that relief from symptoms, sputum conversion, stability of lesions, and cavity closure as visualized by serial chest roentgenograms for a period of three to six months is the desired objective. This would mean continuous drug therapy to the stage of arrested or inactive disease as defined by the 1950 National Tuberculosis Association Diagnostic Standards.

SUMMARY AND CONCLUSIONS

Data are presented on 99 patients with moderately or far advanced pulmonary tuberculosis treated four months with 150 or 300 mg of isoniazid daily combined with 2 gm of streptomycin every third day. Ninety-seven of these patients have been observed for six months and 77 for eight months. A comparative evaluation of 98 patients whose disease was similar in extent and nature treated for a period of eight months with 2 gm of streptomycin every third day and 12 gm of para-aminosalicylic acid daily is included. The dosage of streptomycin was reduced to 1 gm every third day after the sixth month in all patients. Isoniazid and streptomycin toxicity was minimal in extent. The optimum dosage of isoniazid has not yet been determined, and use of larger doses is currently being studied, however, there did not appear to be any difference in therapeutic response between the groups receiving 150 mg and 300 mg of isoniazid daily. Though the response to therapy was favorable in both groups, this preliminary evaluation favored streptomycin combined with isoniazid on the basis of symptomatic response, weight gain, roentgenographic clearing, and cavity closure. A true assessment of the value of this regimen, however, must of necessity be based on results obtained in a larger group of patients treated for prolonged periods of time.

IMPACT OF MODERN THERAPY ON PULMONARY TUBERCULOSIS IN A LARGE MUNICIPAL HOSPITAL

William Weiss, M D, Philadelphia

Remarkable changes in the therapy of pulmonary tuberculosis have occurred in recent years because of the development of chemotherapy, major chest surgery, the swing from pneumothorax to pneumoperitoneum, and the use of antibiotics. At the same time, there has been some change in the type of patient, from the younger to the older age groups. In a short period of time, these changes have altered the prognosis of tuberculosis by a phenomenal degree. Institutional atmosphere has been converted from hopeless resignation associated with the predominant purpose of segregation to one of encouragement associated with an aggressive therapeutic attack, particularly in general hospitals with large tuberculosis units. It is the purpose of this paper to describe the changes in management and over-all results during the past 15 years in the tuberculosis wards of the Philadelphia General Hospital. The situation today is contrasted whenever possible with the situation 15 years ago at this institution as it was reported by Epstein and Hetherington.¹

CHANGES IN AGE, RACE, AND SEX

Since the prognosis of tuberculosis varies with age, race, and sex, the distribution of these factors in consecu-

tive discharges (including deaths) has been compared for the years of 1937 and 1952. As table 1 shows, there has been a great increase in the proportion of Negro women hospitalized but no significant change in the proportion of Negro men. There also has been a large decrease in the number of white patients hospitalized, both men and women. Whereas the largest group of patients used to be white men, the largest group is now Negro women. The race and sex distribution is correlated with the mortality rate in order to evaluate the influence of these factors. There has been a marked, over-all drop in the mortality rate since 1937. In that year, the mortality rate was highest in Negro patients and lowest in white women. The greatest drop in mortality has occurred in the Negro patients, especially the Negro women, and the least drop has occurred in white men. These changes are important in the evaluation of modern therapy. Negro patients used to have a much poorer prognosis than white patients, they now have a slightly better prognosis while under hospital care. The probable explanation for this is that acute exudative tuberculosis is more apt to develop in Negro patients, especially Negro women, than in white patients, and it is this type of lesion that responds best to antimicrobial therapy.

The age distribution of samples of consecutive discharges for both races and sexes is shown in figures 1 and 2. These curves are similar to curves for all the patients discharged in each year. The total number of

1 Epstein H and Hetherington, H. W. Problems in the Treatment of Advanced Tuberculosis in a Municipal Hospital Based on Analysis of Course of Disease and Results of Pneumothorax Treatment, J A M A 114: 723 (March 2) 1940.

patients in the sample from 1937 is a little larger (372) than in the sample from 1952 (303), but a comparison of the age curves shows that there has been a flattening of the curve in the earlier decades in each group except that of the Negro woman. White patients of both sexes

TABLE 1—Race and Sex Distribution and Mortality Rates of Consecutive Discharges in 1937 and 1952

	1937			1952

* Figures do not include patients who transferred to other institutions

and Negro men, therefore, tend to be older now, while the Negro women patients continue to be as young as they were 15 years ago. Since acute tuberculosis is seen oftenest in the young Negro woman and since this type of tuberculosis responds best to antimicrobial therapy, it is understandable that the greatest decrease in hospital mortality has occurred among Negro women.

EXTENT OF DISEASE

The prognosis of pulmonary tuberculosis varies with the extent of disease. A series of patients discharged in 1952 is compared with the series reported for the years 1935 to 1937 by Epstein and Hetherington, with respect to the number of persons admitted with minimal, moderately advanced, and far advanced disease (table 2). For each of these categories, the percentage of patients having sputum positive for acid-fast rods on smear or tubercle bacilli on culture is given. It can be seen that

Fig. 1—Age distribution curves for consecutive discharges of Negro patients in 1937 (solid line) and 1952 (broken line)

there has been an increase in the number of patients with minimal and moderately advanced pulmonary tuberculosis and a corresponding decrease in the number with far advanced disease. A decrease of about 20% in the number with far advanced disease would have a favor-

able influence on prognosis. In the past 15 years, the percentage of patients with sputum containing acid-fast rods has increased a little in those with minimal and moderately advanced disease, but the increase is not statistically significant.

Fig. 2—Age distribution curves for consecutive discharges of white patients in 1937 (solid line) and 1952 (broken line)

Part or all of the decrease in the number of patients discharged with far advanced tuberculosis may be due to the increase in the length of hospitalization since 1947 (see below). The average length of hospitalization is greater for far advanced cases than for minimal and moderately advanced cases, therefore, the turnover of minimal and moderately advanced cases is greater, and they constitute a greater proportion of discharges than 15 years ago. This explanation is supported by the fact that, in 82% of the patients in the hospital at present, the disease is far advanced. This figure is essentially the same as that given by Hetherington and Epstein.

THERAPEUTIC PROCEDURES

In retrospect, the rapid evolution of modern therapy for tuberculosis during the last 6 years or so has been almost dramatic. The procedures accepted during 1937 at this institution are compared with those in use today (table 3). Pneumothorax has almost vanished because of the increasing restriction of the indications for this procedure. There has also been a decrease in the number

TABLE 2—Extent of Pulmonary Tuberculosis and Results of Sputum Examinations

* Epstein and Hetherington¹

of thoracenteses, decompressions, and intrapleural pneumonolyses performed, probably because of the diminishing use of pneumothorax. It should be remembered, however, that the decrease in patient turnover may be a factor.

Phrenic crush is practically never used anymore. The use of thoracoplasty has diminished to less than half of what it was in 1937. These procedures have been partially replaced by pneumoperitoneum and resectional surgery along with antimicrobial therapy. These therapies were not used at all 15 years ago. It is interesting to note, however, that the widespread use of pneumoperitoneum is now being diminished.

† Figure approximate because records were inadequate

It should be noted that therapy is more aggressive today than it was 15 years ago. Although the turnover of patients in 1952 was less than half that of 1937, the number of major surgical procedures carried out in 1952 exceeded the number in 1937. In addition, at any one time in 1952, the percentage of hospitalized patients receiving antimicrobial therapy approached a maximum of 92%. Since the percentage of patients receiving forms of treatment other than bed rest was relatively small, it is reasonable to attribute most of the favorable results of modern treatment (see below) to antimicrobial drugs. In fact, the relative increase in major surgical procedures, particularly the development of pulmonary resection, has been possible only because of antimicrobials.

RESULTS

Profound change has occurred in the clinical manifestations of tuberculosis and its complications since the introduction of effective antimicrobials at this institution in 1947. Since 1950, streptomycin and *p*-aminosalicylic acid have been readily available without financial obligation to the patient, and the course of therapy has been prolonged. Today, when antimicrobials are first given to a new patient, cough rapidly lessens so that narcotics are seldom used, toxicity, fever, and night sweats soon disappear, and, in most cases, the patient begins to gain appetite, weight, and strength. These changes occur more commonly and more rapidly than they did before streptomycin was available and when the only relief for systemic manifestations was bed rest and symptomatic therapy.

Distressing complications such as laryngitis and enteritis are now almost nonexistent. Even complications

that used to have a fatality rate of or near 100%, such as miliary tuberculosis, meningitis, and pericarditis,* often respond to therapy today. As a result of modern aggressive therapy, the patient feels that progress is real, this is reflected in his willingness to remain under treatment. There has been, therefore, a sharp increase in the average length of hospital stay that began in 1947 and has increased to more than three times its previous level (fig 3). On the other hand, some patients leave the hospital against advice, because they feel well and cannot be convinced that well-being is perhaps the least important manifestation of recovery from tuberculosis.

The major effect of antimicrobial therapy has been a dramatic lowering of the mortality rate. This is illustrated by the curve for deaths in percentage of total discharges (fig 3). A sudden drop began in 1950, with the widespread, prolonged, combined use of streptomycin and *p*-aminosalicylic acid. Whereas there used to be as many as five deaths per day, there are now sometimes only five deaths per month in the same department containing almost 400 beds. This sounds better than it actually is, however, for many patients with extensive, destructive pulmonary disease continue to be admitted, and death is delayed rather than prevented.

Disposition of patients in 1952 is compared with figures for 1935 to 1937 from the report of Epstein and Hetherington (table 4). Figures for 1952 represent the entire department of five services, whereas those for 1935 to 1937 represent only one service. Unfortunately, similar figures are not available for the entire department in previous years. The major change has occurred in the percentage of deaths that has dropped from 43% to 18.2%. The proportion of patients discharged with consent and to other institutions (sanatoriums) has increased a little. It is interesting, however, that there has been no

Fig 3—Average length of hospital stay of patients with tuberculosis in months and mortality rate in percentage of total discharges for the 10 years 1943 to 1952 inclusive.

significant drop in the proportion of patients discharged against advice and that only a few patients are now subjected to compulsory hospitalization. Compulsory hospitalization was not invoked at all in previous years. A small percentage of patients are now transferred to other departments of the hospital, when a nonpulmonary

complication attains prominence This was rarely done in 1937, and it merely reflects a change in policy since 1937

The foregoing figures are expressed in terms of the number of discharged patients per unit of time It is of in-

TABLE 4—Data Concerning Discharge of Patients with Tuberculosis

	1937 to 1937*		1951

* Patients had been treated on the service of Dr Hetherington

terest to determine whether the same conclusions can be reached from figures obtained for consecutive admissions In table 5, the hospital mortality rates by length of hospitalization for a sample of 101 consecutive admissions during January, 1937, are compared with a sample of 94 consecutive admissions during the months of October to December, 1951 It is again obvious that there has been a marked increase in the length of hospital stay In 1937, only 2% of the patients remained in the hospital for six months or more, while, in 1951, 55% did so In 1937, no patients remained in the hospital for 12 months or more, 29% did so in 1951

The hospital mortality rates derived in this manner show a drop from 44%, in 1937, to 15%, in 1951, over a period of 16 months from the date of admission This drop is truly remarkable, but it is too early to calculate the exact figure for 1951 admissions, because many patients are still in the hospital under therapy and some of these may yet die The question arises of how many patients will relapse after discontinuation of antimicrobial therapy and hospital care It remains for the future to tell how lasting are the current therapeutic benefits

COMMENT

The difficulties involved in comparing two situations at widely different points in time are obvious It cannot be certain that unrecognized variables operate in the

same ways and with the same magnitudes over a period of 15 years A natural decline in the mortality rate of tuberculosis has been apparent in many parts of the world for many years This suggests that changes may

have occurred in the virulence of the tubercle bacillus, in the exposure and resistance of the host, or in various environmental and socioeconomic factors More particularly, subtle changes may have occurred in admission policies It seems unlikely, however, that such changes could be large enough to invalidate the present comparison of therapeutic results, since the dramatic fall in the hospital mortality rate and the marked increase in the average length of hospitalization is so closely related to the recent rapid changes in therapeutic methods, particularly to the developments in antimicrobial therapy The accelerated fall in hospital mortality since the advent of effective specific drugs has been reflected to some extent in a more rapid decline in the tuberculosis mortality rate for the entire city of Philadelphia, although the latter has not fallen so strikingly as the former The reasons for this difference are not within the scope of this paper, but it is safe to say that an inadequate number of hospital beds is the major factor

It is not my purpose to compare the virtues of pneumothorax with those of pneumoperitoneum or the advantages of thoracoplasty with those of pulmonary resection Actually comparison of these procedures is not valid, because the indications for each differ, and each has its own place The changing use of these therapies is primarily a reflection of improved clinical judgment and better understanding by the physician of the indications for each method of treatment and also a reflection of the development of antimicrobial therapy together with a broader surgical attack

In recent years, although there has been an increasing number of beds available, the rapid decrease in patient turnover in institutions in Philadelphia has aggravated the need for beds Improved methods of therapy have contributed to this situation instead of relieving it because they have prolonged the length of hospital stay The initial enthusiasm that greets the discovery of a new "miracle drug," with the hope of easing the over-all public health problem of the tuberculosis situation by rapid "cures," is, therefore, not based on realistic appreciation of the therapeutic obstacles inherent in the nature of the disease This is particularly true when one realizes that, although there has been a significant and continued decrease in tuberculosis mortality, morbidity rates have continued at a high level³ This indicates that we have not greatly reduced the contamination of society A review of newly reported cases in Philadelphia over the last 12 years⁴ reveals no significant changes except for those that can be accounted for by changes in case finding and case reporting Those who point to the decreasing mortality rate as evidence that the tuberculosis problem is solved are refusing to face reality The receiving ward of the Philadelphia General Hospital continues to turn away, for the lack of beds, all patients with tuberculosis except those who are terminal or who have an emergent complication such as hemoptysis The patients who are turned away then become names on a waiting list (This applies only to men at the present time)

4 Figures made available by the Philadelphia Tuberculosis and Health Association

SUMMARY AND CONCLUSIONS

During the past 15 years, there has been a remarkable change in the management and results of treatment of pulmonary tuberculosis. At the same time, there has been some change in the type of patient admitted to the hospital. These changes are described as they have developed in a large municipal general hospital.

Except for the Negro woman, patients with tuberculosis tend to be older today, the proportion of Negro patients has increased somewhat, and there is a smaller proportion of patients with far advanced disease discharged. The latter change may be due to differences in patient turnover, since the average length of hospitalization has increased, particularly for far advanced cases.

Pneumothorax, phrenic crush, and thoracoplasty have been replaced during the last six years to a great extent by pneumoperitoneum, pulmonary resection, and antimicrobial therapy, and these changes have been accom-

panied by a striking increase in the average length of hospital stay and a decrease in hospital mortality rate. The latter has occurred since 1950, when prolonged combined antimicrobial therapy became common. Institutional atmosphere and patient morale have greatly benefited from more aggressive therapeutics, rapid clinical response to antimicrobials, and improved prognosis. It should be emphasized that the outstanding development in modern therapy has been the prolonged, combined use of specific drugs.

The need for beds, however, has been aggravated rather than alleviated. Although relapse rates after antimicrobial therapy are not yet available, long-term follow-up studies will probably show that drugs often serve only to delay death rather than to achieve a "cure." For this reason, the problem of tuberculosis will continue to be one of major proportions for some time.

UTERINE INERTIA

L. Clark Hepp, M D, Denver

During the past two decades, marked changes have occurred not only in the teaching but also in the practical application of obstetrics. The "watchful waiting" of some of the best teachers and clinicians has been replaced by sound knowledge and thoughtful application of facts learned, instead of the noninterference advocated formerly.

The "newer obstetrics" inquires into the factors that cause uterine inertia, with sound clinical judgment used in determining when passive expectancy should be replaced with active help for the patient. Many teachers are now beginning to teach what they practice rather than to practice radicalism and to teach conservatism. This approach has resulted from the realization that so-called normal labor can result in great harm to both mother and child. A prolongation of either the first or second stage of labor due to inertia may lead to fetal damage if the condition is not corrected by a sane approach to the problems causing these irregularities in labor.

Uterine inertia has been defined as weak or irregular uterine contractions during labor. Under ordinary circumstances, the pains of labor are progressive in severity and frequency from the onset until the delivery, causing cervical dilatation to proceed in a continuous uninterrupted manner.

Reynolds¹ and Reynolds and co-workers² studied uterine motility by means of the Tokodynamometer, a recorder with gages to measure muscle strain placed externally. By this method they show that the fundus contracts with greater force and does more work than the

middle portion of the uterus or the lower uterine segment. The intensity of the contractions and the amount of work done by the fundus increases as normal labor progresses. Failure of the uterus to contract with sufficient vigor and coordination to effect continuous cervical dilatation results in prolonged labor. This phenomenon has been called uterine inertia of the primary or true type.

Secondary inertia is the term applied when contractions are first normally vigorous but as a result of exhaustion become infrequent and ineffective. Essentially it is a condition of maternal fatigue with exhaustion and dehydration. Under ordinary circumstances the pains of labor are progressive in severity and frequency from the onset until delivery.

A lapse of eight hours with no cervical dilatation seems to be sufficient for the condition to be called secondary inertia. A lapse of from four to eight hours seems to be time enough for the condition to be recognized by most obstetricians. Treatment then can be instituted without affecting the fetus too greatly. An analysis by Eastman³ of 6,608 labors showed that the incidence of secondary inertia was 3.5%.

The discussion in this paper applies to uterine inertia only and it is assumed that other conditions such as disproportion and malformations of the fetus are not present or have been ruled out.

CAUSES

Position or Stage of the Fetus—When the head or breech does not press firmly or evenly against the cervix or lower uterine segment, the frequency and intensity of the pains are not normal. Posterior or transverse positions of the head are other examples of conditions that cause abnormalities of labor.

Overdistention of the Uterus—Multiple pregnancy or hydramnios may cause an overdistention of the musculature of the uterus. In such cases the pains are not normal.

3. Eastman, N. J. Pituitary Extract in Uterine Inertia: Is It Justifiable? *Am. J. Obst. & Gynec.* 53: 432, 1947.

Atypical Development of the Uterine Musculature — Bicornate uteri and all variations and atypical anomalies of the musculature usually result in weak and improper contractions. Hypoplasia of the uterine musculature is characteristic of a type of woman who is unable to conceive for a long period of time and usually has a funnel pelvis and a long cervix with an anteverted uterus. In anterior displacement the uterus is developed above and in front of the symphysis. This causes the pendulous abdomen, and the contractions are always poor in quality and irregular.

Inhibition of Contractions Due to Emotional Disturbance — Recent work has shown that excessive production of epinephrine as a result of anxiety or fear results in cessation of contractions. The action of the epinephrine on the innervation causes inhibition of the pains.

Debilitating Conditions — Anemia, hemorrhage, prolonged fevers, chronic wasting diseases, and rapidly succeeding pregnancies are all conditions that must be considered in uterine inertia.

Tumors in the Wall of the Uterus — Tumors may interfere with the coordinating and conducting apparatus and cause alterations in strength, frequency, and duration of contractions. Multiple fibromyomas are the most frequent offenders.

Heredity — Some women in whom none of the other factors are present have prolonged labors as did their mothers and other relatives. This group I would rather call the glandular type, as they usually are short, fat, and lethargic and generally follow the hypothyroid pattern. Their glandular systems and secondary manifestations are usually underdeveloped.

TREATMENT

The station and position of the presenting part and the dilatation of the cervix are the cardinal points in the successful vaginal delivery of all patients. Primary inertia or that occurring in the early stages of labor may be preceded by spontaneous rupture of the membranes. Early rupture of the membranes was thought to result in a difficult or dry labor. Recently, a different view has been advanced that confirms my experience that labor is considerably shortened when the membranes are ruptured early. While breech presentations do not cause even pressure on the lower uterine segment as does a well-engaged vertex, nevertheless rupture of the membranes causes lengthening of the lower uterine segment, with the resulting thinning, effacement, and dilation through pressure on the cervix.

Since the advent of antibiotics and a uniformity of sterile technique in all recognized hospitals, infection is not the factor in obstetrics it formerly was. Thus, rupture of the amniotic sac is not feared by the modern obstetrician.

Inertia with breech presentation and especially that occurring in primiparas presents a special problem, as the high mortality rate of the fetuses should be given considerable thought. The present consensus seems to be that in the face of prolonged inertia, cesarean section is the treatment of choice.

Many patients enter the obstetric department in active labor having regular and firm contractions, but

the anxiety, nervousness, and frustration aroused in the subsequent preparations result in a complete cessation of labor pains. Time, rest, and in some instances judicious use of sedatives or hypnotics as the case may warrant results in the resumption of normal labor. When labor is not resumed, inertia is to be suspected and proper means to combat this condition should be instituted.

Posterior pituitary-U S P (Pituitrin) or preferably oxytocin (Pitocin), which is now generally used because of the elimination of side-effects, can be employed intramuscularly in one or two minim doses every 30 minutes to initiate the uterine contractions. The judicious use of this oxytocic serves a definite need in the therapy of inertia.

Oxytocin is given continuously intravenously by placing 0.5 cc of oxytocin in 500 cc of glucose solution and administering it intravenously by the drip method. The rate of flow can be regulated as to the dosage required, but simple arithmetic gives the approximate dosage of 1½ minims in each 100 cc of solution. The patient should be carefully watched, and if the duration of the pains exceeds one minute or if the severity of the contractions is markedly increased, the administration of oxytocin should be stopped. Tetanic contractions can be controlled by analgesics given intravenously, such as meperidine (Demerol), *dl*-methadone (Dolophine), or morphine.

Oxytocin or posterior pituitary extract has been given intranasally successfully by some obstetricians, but this method has not had the widespread use of other methods of administration. Nasal packs are saturated with oxytocin and inserted under the lower or midturbinate bone until physiological action has occurred. The packs can then be removed. The rate of absorption varies with the individual and cannot be regulated as can the other means of administering the drug. This is the most important reason for condemning this means of administration.

Murphy has shown⁴ that estrogens produce an increase in muscle tone of the uterus after the 29th week of gestation in 25% of normal patients. With this rationale, estrogen and estradiol have been given in doses varying up to 500 mg. Its use is questionable, and further study is necessary before it can be widely advocated.

An overdistended bladder or a full rectum may be a factor in the proper advancement of labor. This may at times be ignored because it is considered trivial, but a cleansing enema on admission and careful watching will help many patients over the course of labor in much less time than is generally believed. If labor is prolonged and the patient is under sedation, catheterization should be done as needed by the nursing staff, without special orders from the attending obstetrician.

If the patient has secondary uterine inertia that actually is due to fatigue or exhaustion, proper means of supportive treatment must be instituted without delay. Adequate nutrition and the judicious use of sedatives will do much to prevent or to limit maternal anxiety and distress, which may force the obstetrician to interfere.

before the patient has reached the stage where vaginal delivery is safe

The cervix being soft, dilatation usually occurs if given time, but the "rigid" or "stenosed" cervix must be treated with respect. Spastic cervix is another term given this condition. The diagnosis is made by vaginal examination, and the cervix is usually effaced but a small opening of 1 or 2 cm with a firm musculature surrounding the cervical opening persists. The pains are usually active and strong, but the spasm in the lower uterine segment seems to be the condition delaying the progress of labor. This condition is not to be confused with a true contraction ring, which occurs higher in the musculature of the uterus. Dihydroergotamine (DHE-45), in doses of 0.5 cc given intramuscularly or intravenously, should be administered for spastic cervix or spasm of the lower uterine segment. Baskin and Crealock⁵ and Gill and Farrar⁶ have reported excellent results with this drug.

Dihydroergotamine was prepared by Stoll and Hoffman.⁷ It differs from ergotamine in that it is said not to have an effect on uterine muscle, instead of producing vasoconstriction, it causes some vasodilatation. The sympatholytic effect of dihydroergotamine is more powerful than ergotamine tartrate-U.S.P. (Gynergen) according to Rothlin.⁸

More recent work by Sauter⁹ has shown that the tone of the whole uterus is increased by sympathetic activity and decreased by parasympathetic activity. This can be interpreted to mean that overactivity of the sympathetic nervous system may cause a degree of spasm of both the cervix and the upper uterine segment. This author suggested that diminished sensitivity to sympathetic impulses, which may be produced by dihydroergotamine, may relieve such spasm.

There might be some hesitancy to use dihydroergotamine because it is an ergot preparation, but it must be remembered that it differs from the natural alkaloid, ergotamine. Dihydroergotamine is, however, a potent drug and must be used cautiously and in selected cases. I have used this drug in 10 cases of cervical dystocia, in doses of 0.5 cc intravenously, with dramatic results and without side-effects. It should not be used unless the cervix is dilated from 4 to 5 cm nor in the presence of malposition or disproportion.

Altman and co-workers¹⁰ reported that dihydroergotamine is oxytocic and can induce labor, and they caution against its indiscriminate use. These findings do not agree with those of other observers.

Constriction or contraction ring is an annular contraction of the uterus that may occur theoretically at any level of the uterine muscle and cause dystocia in the presence of a normal cephalopelvic relation. The position of the

ring remains constant during labor, and rupture of the uterus does not occur. The absence of rupture is explained by the fact that the upper segment is often relaxed and contracts ineffectively, whereas the lower segment is not excessively thinned out. The constriction ring is for this reason associated with uterine inertia. A ring may occur at the external or internal os, at the junction of the upper and lower segments, or at any level of the upper and lower segments. Inertia may be present in both upper and lower segments, but increased tone in one or both areas of the uterus may be a part of the picture of inertia.

Dührssen's multiple incisions with forceps delivery usually are heroic measures that do not get the ring at all. Manual dilatation, with forceps or version and extraction, can be used with good results under certain circumstances but at present manual dilatation is generally regarded as manual laceration.

Magnesium sulfate, given intravenously, 10 cc of a 20 or 25% solution, calcium gluconate, 10 cc of a 10% solution, or magnesium gluconate, 10 cc of a 20% solution, may be tried for the relaxation of the ring. Epinephrine, 10 minims intramuscularly, and dihydroergotamine, 0.5 cc given either intravenously or intramuscularly, have proved of value.

With the patient under deep anesthesia, the hand should be placed in the vagina or the uterus as the case may be so that the relaxation of the ring can be felt. When anesthesia or drugs fail to relieve the spasm, cesarean section should be done.

Application of Willett scalp traction forceps to a fold of the child's scalp with 2 lb (0.9 kg) of traction has proved of value in certain instances of inertia when the cervix was at least half dilated. The bad fetal results, namely, the laceration and slough of the area on the child's scalp, have generally resulted in less use of this procedure than of most techniques.

The hydrostatic bag can be used in inertia when the cervix is half or more dilated. Two pounds of traction are usually applied, and results generally are forthcoming within one to four hours. Its use is not without some hazards, infection and the need for an anesthetic for incision being the chief ones. It has limited use and should be used only in cases in which conditions justify the risks incident to its introduction.

Surgical delivery is indicated at any time the cervix is fully dilated. If the head is above the ischial spines, version and extraction should be the procedure of choice, while forceps extraction is recommended when inertia appears after full dilatation of the cervix and the head is below the level of the ischial spines. Anomalies of the uterine musculature and tumors of the wall of the uterus evidence themselves by poor contractions even after various methods of uterine stimulation are used.

Cesarean section may be the choice of delivery when one or a combination of the previously mentioned conditions are the cause of the inertia. It should not be the means of last resort, but should be used after a reasonable trial of other methods mentioned before in the treatment of inertia. We have the facts and figures on cesarean section, which are well known. What we do not have are the statistics on the mothers who have been made chronically invalids for life because a cesarean section was not done early in a complicated labor, but the mothers were

delivered from below. A stillborn infant and the mother left in questionable condition because the obstetrician did not want to increase his incidence of cesarean section is a picture that is too familiar.

SUMMARY AND CONCLUSIONS

Clinically, the condition of uterine inertia should be recognized, as early diagnosis is essential to successful treatment. It is a complication in about 3.5% of deliveries. The two types of inertia, primary and secondary, have been described. True and false labor must be differentiated. The cause and type of inertia can then be determined.

Disproportion and midpelvic contractions should be ruled out before the patient goes into labor by means of x-ray measurements. Abnormal fetal positions should

also be recognized, occiput posterior and breech presentations are the commonest ones. Inertia with breech presentation in primiparas, particularly those over 35 years old, is a special problem and must always be given careful consideration before any treatment is instituted. The high fetal loss has been shown to be due to asphyxia and intrauterine infection. Rest, sedation, and fluids are of value in the exhausted patient, but most errors result from failure to recognize the spastic lower uterine segment type of inertia early in its appearance.

Failure after adequate trial by the nonsurgical methods of stimulation should be an indication for cesarean section, which is the surgical procedure of choice if done early.

EFFECT OF CIGARETTE SMOKE ON THE PERIPHERAL VASCULAR SYSTEM

RADIOACTIVE IODINATED ALBUMIN USED AS INDICATOR OF VOLUMETRIC CHANGE

Morris T. Friedell, M.D., Chicago

The inhalation of tobacco smoke will produce vasoconstriction because, chiefly, of its nicotine content. Roth¹ states that from 2.5 to 3 mg of nicotine are absorbed from the lungs when a standard cigarette weighing approximately 1 gm is smoked. She devised a test that showed that two cigarettes smoked in succession produced a drop in the skin temperature of a finger. The decrease in skin temperature was considered indicative of the vasoconstriction produced by smoking. According to her figures, therefore, it can be assumed that each person tested received from 5 to 6 mg of nicotine during the time required to smoke two cigarettes. Roth states that, when nicotine is injected intravenously in 2 mg quantities, the degree of drop in skin temperature is much more rapid and definite than that which follows the smoking of two standard cigarettes. Obviously the effects of nicotine obtained from smoking and from direct injection are not quite similar.

Alterations in skin temperature have long been used to estimate changes in blood flow of an extremity. Fletcher² has pointed out that the sensitivity of skin temperature as an index of blood flow in the room temperature range is not as satisfactory as might be considered from its common use in measuring peripheral circulation. Other methods such as plethysmography and nail bed capillary counts have been used to estimate peripheral blood flow, but all these methods carry with them a definite factor of error. All of these tests, nevertheless, tend to show that vasoconstriction can be produced by smoking.

Krieger and associates³ have described a method in which radioactive iodinated human serum albumin is used to evaluate peripheral circulation. The administration, intravenously, of albumin tagged with I¹³¹ will allow accurate measurement of the circulating blood volume because this material disappears slowly from the blood stream. (There is some evidence that, during the first 24

hours, some equilibrium changes occur with the albumin of the lymph.⁴) Five to 10 minutes after injection of the tagged albumin, adequate mixing appears to be established in the blood, and a constant reading of radioactivity may be obtained from an extremity. Since the radioactivity originates solely from intravascular sources, it serves as an index of the blood volume of the site measured. Induced changes in radioactivity will thus indicate and be directly proportional to alterations in blood volume over the area. It can be shown that, with alterations in blood volume, radioactivity will increase or decrease. Since measurements are made with a scintillation counter that is sensitive to gamma radiation, the changes in radioactivity will reflect the change in blood volume in a cross section of the area measured rather than of the surface only. The per cent change of radioactivity, it must be assumed, indicates an equivalent change in blood content of the volume measured. Such a method appears to be suitable for measuring vasoconstriction and dilatation in an extremity and was used to study the effects of smoking on the peripheral circulation.

EXPERIMENTAL PROCEDURE

In our tests, cigarettes of standard size in the popular brands were used. No attempt was made to control this factor. In order to simulate the same test with a cigarette

The radioactive iodinated serum albumin was obtained from Abbott Laboratories, North Chicago, Ill.

From the Hektoen Institute for Medical Research of the Cook County Hospital. Clinical Associate Professor of Surgery, Stritch School of Medicine. Attending Surgeon, Cook County Hospital.

supposedly permitting less inhalation of the products of tobacco combustion, however, the results in each person were compared with the results of each smoking a cigarette fitted with a newly developed and highly efficient filter. This filter was claimed by the manufacturer to reduce the nicotine and tars inhaled by about 50%. The test proved to be sensitive enough to distinguish, significantly, differences between the effects of the two types of smoke inhaled. The investigations have since been extended to a comparison of other types of filters and to a determination of sensitivity to cigarette smoke in peripheral vascular disease. The latter will appear in a subsequent report. We believe that the test should prove to be a good indicator of the susceptibility of a person to tobacco smoke.

Method—One hundred to 125 μ c of labeled (I^{131}) serum albumin in 1 or 2 cc of isotonic sodium chloride solution were injected intravenously. For a few days prior to this time, the persons tested can be given a strong iodine solution (Lugol's solution) to protect the thyroid gland. The dose of labeled serum albumin used hardly exceeds a standard tracer dose, however, and has no significant effect in adults. This quantity afforded enough radioactivity to permit testing for several days. Tests were carried out from 2 to 48 hours after injection.

Equipment—A scintillation counter was used with suitable lead shielding to eliminate extraneous radiations from the body. The counter was directed solely toward the extremity measured (the hand extended laterally from the body was most convenient). The impulses from the counter were fed through a count-rate computer and recorded simultaneously on a moving graph (Esterline-Angus). An alternate method of continuously recorded radioactivity was obtained from minute to minute counts fed from the scintillation counter into a variable scale counter attached to a mechanical printing and automatic timing recorder (Streeter-Amet).

Testing—The persons tested were allowed to recline with the arm extended straight and laterally from the shoulder. The arm and hand were supported by a padded board. Constrictive restraints were not applied, the fingers were allowed to lie comfortably in contact with the aperture of the scintillation counter. In order to avoid disturbances in geometry that would thus alter the basic counting rate, motion was not permitted. The radioactivity present in the body had little effect because of the distance and the shielding between it and the scintillation counter. After the person had become comfortably adjusted, preliminary measurements were made to assure stable recording of the radioactivity present. (The radioactivity must be several times the background to give statistically accurate results.) With this technique, it is possible to obtain stable counts minute after minute without inducing fatigue or altering the geometry.

After these arrangements were completed a smoking test was made. The cigarette was lighted, and the person was permitted to smoke for four minutes. The rate of smoking was regulated so that two-thirds of the cigarette was consumed. Observations continued for some time after the cessation of smoking.

Selection of Subjects—The persons tested were chosen at random and did not have any obvious disturbance of the cardiovascular system. In order to obtain random selection of cigarettes, various brands were obtained by borrowing them from people about the hospital or by purchasing them over the counter. The filtered cigarettes were supplied by the manufacturer, but open purchase was also made in stores.

RESULTS

For some time, we have been using radioactive isotopes for the study of peripheral vascular circulation. Even those in the form of diffusible ions have enabled us to compare blood volumes, especially in unilateral peripheral vascular disturbances. They have also permitted us to compare the effects of vasodilating and vasoconstricting mechanisms on the peripheral vascular system. In our experience, a vascular arterial occlusion that reduces the radioactivity in an extremity to 40%, or less, of that of the nonaffected side will inevitably cause gangrene, although efforts at peripheral dilatation, such as ganglionic nerve block or sympathectomy, seldom increased the radioactivity more than 50% above that of the uninvolved extremity. It was assumed, therefore, that alterations in blood volume caused by smoking would hardly exceed these figures. In fact, we feel that it can be stated that alterations in blood volume of more than plus or minus 50% of the norm will not occur except in pathological states. In the subjects tested, alterations in net radioactivity reached these maximum changes momentarily in a few persons but were quite exceptional. A rise in radioactivity occurred in some persons after smoking. The cause for this is probably peripheral dilatation rather than constriction; it can also be reproduced by light venous constriction. (Thus it can be hypothesized that, in some persons, venous constriction rather than arterial constriction predominates.) These changes in radioactivity indicate that the method selected is sensitive to changes in blood volume *in vivo*, and this is borne out by the subsequent results.

Parenthetically it should be noted that a number of persons who had been rendered radioactive for other reasons, for example, for the treatment of leukemia with radioactive phosphorus and for the treatment of thyroid disease with radioactive iodine, and whose blood streams contained a measurable amount of radioactive substance (measured with a Geiger-Mueller counter) responded similarly to these simple tests and also responded to smoking with changes in the concentration of radioactivity in the extremities.

One hundred persons with presumably normal circulation were tested. There were 52 men and 48 women in this group. The median age of the men was 34, and the median age of the women was 32. The men ranged in age from 21 to 70. The women ranged in age from 17 to 61. It was found that 79 of the persons tested were sensitive to ordinary cigarette smoke. This meant that

one out of five persons who smoke show no response to a single cigarette by this method. When the newly developed, mineral type, filtered cigarettes were tried, 34 persons, or one out of three, showed no response to the smoke from filtered cigarettes (fig 1). This finding indi-

Fig 1—Over all response to smoking in 100 patients tested

cated that the nicotine and other alterative factors were removed in a certain percentage to a level either to which the test was not sensitive or to which the patients did not receive enough vasoalterative substance to produce change in the radioactivity of the part measured, the fingertips. Men and women showed about the same percentage of sensitivity to smoke. The women, however, responded somewhat better to filtered smoke than the men. Approximately 71% of the men showed some reaction to smoking a filtered cigarette. Only 60% of the women showed a reaction to smoking a filtered cigarette.

The degree of sensitivity to smoke was reflected not only in the alteration of radioactivity but also in the

Fig 2—Average change in radioactivity (blood volume) of women tested

rapidity of onset and the length of time for recovery after smoking had ceased. The maximum response occurred from 8 to 10 minutes after the person began to smoke. In general, the men recovered somewhat more quickly after

smoking than the women, the rate of recovery was proportional to the degree of alteration in radioactivity. Contrary to some previously published reports,¹ the additional effect of smoking two cigarettes consecutively, once the vasoconstriction or vasodilatation had occurred, was not marked, therefore, the test was confined to the smoking of a single cigarette. Until recovery had been completed, smoking another cigarette had no further effect except in one or two instances.

The period of recovery was marked in some persons by rather bizarre increases and decreases in radioactivity that indicated periods of constriction and dilatation. These were more noticeable in some smokers than in others, but they probably represent attempts to compensate for the previous alteration in the peripheral circulation. Smoking a cigarette during this period usually had little or no effect (figs 2 and 3). The degree of alteration in radioactivity was much more apparent in women than in men, indicating a greater sensitivity to the effects of smoke or else a much more elastic peripheral vascular system. Since the latter is a recognized fact

Fig 3—Average change in radioactivity (blood volume) of men tested

in women, it is felt that the degree of response represents a sensitivity to smoking in women that is considerably greater than in men because of the much more labile peripheral vascular system (fig 4).

The maximum degree of alteration in blood volume in sensitive men averaged 19%, whereas, in women who responded, the degree of alteration was approximately 33%. The addition of a filtered cigarette in each case lowered the responses considerably. The men showed a 10.7% change with a filtered cigarette, while women showed a 20.5% change. This would indicate that women are much more sensitive to nicotine and other tobacco products than men. This probably accounts for two factors: (1) women who enjoy the reaction of tobacco become deeply habituated, continue to smoke, and find it hard to stop, and (2) men who get less reaction from smoking probably will smoke more cigarettes.

In spite of a greater sensitivity or greater response by women to smoking, the incidence of peripheral vascular diseases of certain types in which the vasoconstrictive effects of smoking are supposedly an etiological cause is less common and, in fact, quite rare in women. Buerger's disease in women is quite unusual. On the other hand, Raynaud's disease and other labile vascular diseases are commoner in women, and this would indi-

cate that women have relatively less stable or more responsive peripheral vascular systems. This coincides with the work of a number of other investigators, as cited by Roth¹, that is, the vasoconstrictive effects of smok-

Fig 4—Comparison of percentage change in radioactivity (blood volume) caused by filtered and nonfiltered cigarettes

ing in patients with Buerger's disease are not demonstrably greater than in those with normal circulation. The effect of tobacco smoke in Buerger's disease is probably unrelated to vasoconstriction from smoking.

Effect of Age—Most of the subjects were young persons with responsive peripheral vascular systems. It was noted that of the 21 persons who were older than the average age for each sex, there was no change on smoking in 18, indicating that older patients have little or no vasoconstrictive effects from smoking. A few of the same 21 showed a definite change due to smoking.

Most of the subjects tested were smokers, and it was difficult to differentiate between the smokers and the nonsmokers. There was a group, however, in which smoking was less common. These persons were often reluctant to take a cigarette when it was offered and would not submit readily to the test. All of these responded to smoking by a positive aversion, nausea, dizziness, and a feeling of weakness, and, in all of these, there was a rise in radioactivity in the extremity measured. None of these persons enjoyed smoking, although some of them smoked on occasion.

This phenomenon (the rise in radioactivity) was discovered by chance when preliminary investigations were underway. A patient who had previously received a therapeutic dose of radioiodine for hyperthyroidism was asked to smoke. She was unwilling to do so, but, after persuasion, she submitted. The scintillation counter was placed against her fingertips. After the base line was determined, the patient was requested to smoke a standard cigarette. There was a prompt rise in radioactivity of the extremity. Because this was an unexpected phenomenon, she was asked to return the next day. The next day she stated that she did not wish to smoke another cigarette because smoking made her feel quite ill. She had forsaken smoking long ago for this reason. With some persuasion the test was repeated, and the same phenomenon occurred. It was considered possible at this time that the change in radioactivity could be attributed to this woman's hyperthyroidism as much as to any other factor. When 100 supposedly normal persons were examined by the same method, however, it was

found that 16 of the sensitive persons responded by a rise in radioactivity after smoking. This was approximately 20% of the sensitive persons (fig 5). We are unable to account for this rise, except that it does resemble the same type of rise caused by light venous occlusion. We feel that we should attribute it to an increase in blood volume in the peripheral circulation, with probably a concomitant diminution in central circulation that results in the sensations of nausea and dizziness and a feeling of weakness and illness.

SUMMARY AND CONCLUSIONS

Men and women are not equally sensitive to tobacco smoke. Approximately one out of every five persons does not receive sufficient nicotine to affect the peripheral circulation. Since many of these persons do not inhale, it is quite likely that it is the method of smoking rather than the effect of smoking that causes no change in peripheral blood volume.

The vasoalterative effects can be reduced by the addition of an efficient filter and probably could be done away with if the filter were made sufficiently effective. The desirability of reducing the vasoconstrictive or the vasoalterative effect by filtration seems to be indicated more in women than in men. Possibly, special brands of cigarettes should be sold to women to reduce this effect further. The lability and the sensitivity of the peripheral vascular system is evidenced by the fact that there is 33% alteration of radioactivity (blood volume) in women when a standard cigarette is smoked, as against 19% alteration of radioactivity (blood volume) in men.

Many older persons, in the group over 35 years, did not show change. Of 21 persons who did not respond to the test, 18 were beyond the median age. This indicates that these persons either do not inhale when they smoke or have less sensitive peripheral vascular systems. Prob-

Fig 5—Comparison of reaction to smoking by sex.

ably, persons over 40 can smoke without evident, immediate alterative effects on peripheral circulation.

The principle of filtration of tobacco smoke is probably a good one and should be used by both men and women. Women evidently need it more than men.

THE RECORDING OSCILLOMETER IN ORTHOPEDIC PRACTICE

Fremont A Chandler, M D

and

Philip H Dickinson, M D, Chicago

The circulation of blood through the extremities has been known to be of basic importance since the dawn of medical knowledge, and devices for its measurement date back almost as far Aristotle¹ (384 to 332 B C) and other ancients were aware that pulsations occurred in the peripheral blood vessels, but it was not until after Harvey's² classic description of the hemodynamics of circulation in 1628 that Francis Glisson (1597 to 1677) developed the first crude mechanical device for the measurement of peripheral circulation. It consisted of a plethysmograph for the measurement of changes in the size of a part due to changes in the circulation in the part. A similar instrument for the measurement of muscular contraction was developed by Jan Swammerdam (1637 to 1686).³

Since that time many investigators have added ideas and mechanical devices for the measurement of peripheral blood flow. Among the most recent is the recording oscillogram developed by Dr Carl A. Johnson of Chicago.⁴ During the past year, 435 patients have been studied with this instrument at the University of Illinois' Department of Orthopaedic Surgery. This paper consists of a report of the findings in these cases and a discussion of this method of recording extremity blood flow.

METHOD

The recording oscillogram is of the mechanical recording type, with optical registration of the volume changes. It consists essentially of a blood pressure cuff that, when inflated, transmits the pulse wave to an alcohol droplet in a pipet, causing the droplet to oscillate. A beam of light directed across this droplet is focused by it on a timed and calibrated photographic paper producing a graphic record of the circulation. In measuring the waves⁵ produced by the oscillogram in a normal subject the amplitude and the crest time are of interest. The amplitude will vary according to the pressures in millimeters of mercury at which the readings are taken and will vary if the circulatory mechanism is affected by disease or other factors. The crest time, which is the time elapsed from the beginning of the upstroke to the first notch, varies from 0.08 to 0.12 seconds in normal subjects. Changes in this value indicate myocardial damage or a collateral type of circulation.⁶

In selecting subjects for this study, attempts were made to choose persons who had involvement of only one extremity so that recordings obtained from the normal member could be used as a control. Beginning oscillogram readings were taken at 200 mm Hg, each subsequent reading being taken at 30 mm less, until a pressure of 80 mm Hg was reached. This procedure was followed in all patients except children, in whom the highest pressures at which recordings were obtained was 170 and the lowest 50 mm Hg. Skin temperatures were taken by means of a thermocouple on the extremities in all patients studied. Subjects with the following disorders were

examined (1) poliomyelitis, (2) osteomyelitis, (3) fractures, (4) vascular disturbances, and (5) miscellaneous disorders.

POLIOMYELITIS

To date, a total of 20 patients who have extremity involvement from anterior poliomyelitis, ranging in age from 5 to 55, have been studied. Ten were males and 10 females. All patients in this group were seen at least 18 months after their acute illness, and all were admitted to the Illinois Research and Educational Hospital to undergo reconstructive surgery. No patients in the acute phases of the disease were studied. The circulation on the affected side is decidedly decreased. The skin temperatures, however, are about the same. The decrease in circulation correlates well, in most cases, with the decreased muscle mass and shortness on the involved side.

OSTEOMYELITIS

Twenty-four patients with osteomyelitis were studied, ranging in age from 10 to 55 years. The infection was of such long standing and severity in four patients that amputation was necessary. Twelve showed increased arterial pulsations on the involved side, four showed a decrease, and eight showed no change. Patients showing a decrease or no change had minimal active infection on admission to the hospital. In the 12 patients showing increased pulsations either there was an acute as well as a chronic inflammatory process or there was extensive scarring and soft tissue involvement with edema. An example from this last group is seen in figure 1. Here the clinical findings would lead one to expect a decreased circulation, yet the opposite is shown by the oscillogram. The skin temperatures do not correlate with the oscillogram findings showing no change.

FRACTURES

Thirty-eight fractures were examined in patients ranging in age from 7 to 88 years. Thirteen of these fractures were fresh, and 25 were old (occurring six months or more prior to hospital admission). Of the limbs with fresh fractures, two showed no change, three

showed an increase, and eight showed a decrease in arterial pulsation, in the chronic group, nine showed an increase, seven showed no change, and nine showed a decrease in pulsation. In these groups the findings are varied. The majority of limbs with fresh injuries showed a decreased circulation, probably due to diminishing of the arterial vascular bed by vasospasm and swelling

Fig 1—Oscillometric recordings of pulse waves in the legs of a patient who has had osteomyelitis with drainage in the left leg for 30 years. Note that the pulse waves are larger in the involved leg yet the skin temperatures in both legs are equal.

Among the patients with old fractures, those who showed increased pulsation had considerably more scarring and edema than did the others. Figure 2 shows an example of this. Again it is noted that skin temperatures and oscillometric readings do not correlate.

VASCULAR DISTURBANCES

Oscillometric readings were obtained in several patients with extremity injuries that resulted in vascular disturbances. Findings in these patients were as would be expected, with one or two exceptions. Four patients with Volkman's contracture revealed marked diminution in the circulation as well as some decrease in skin temperature. One patient with thrombosis of the abdominal aorta, who had previously had a sympathectomy, showed bilateral decreased circulation by oscillometry but no decrease in skin temperature. One patient with thrombosis of the femoral artery showed a considerable decrease in the amplitude of the pulse wave along with an increased crest time. A patient with femoral vein thrombosis revealed a tremendous increase in the arterial pulsations, as did one with an arteriovenous fistula at the wrist. Several patients were studied following treatment by lumbar sympathetic blocks. Some of these

showed an increase in skin temperature but no increase in pulse wave amplitude. Others showed an increase in both skin temperature and arterial pulsation. Sympathectomies were done on two of these patients by the peripheral vascular service, with a resulting increase in each of skin temperature as well as pulse wave, however, the increase was greater and persisted longer in the patient who showed by oscillometry increased circulation following this treatment than in the one who showed no such increase. It was also noted that, following lumbar block, a decrease in amplitude occurred in the pulsations of the unblocked side, which lasted for a short time.

MISCELLANEOUS DISORDERS

Many other orthopedic conditions were studied with the recording oscillogram, but no consistent changes or abnormalities were revealed. In this group are cases of herniated intervertebral disk, low back pain, tuberculosis of the vertebrae (Pott's disease), club feet, congenitally dislocated hips, arthritis, and slipped femoral epiphysis. The effects of smoking were studied on several persons, and it was found that a single cigarette could decrease the arterial pulsation by as much as one-third in some persons. All persons tested showed some decrease.

COMMENT

In reviewing the cases studied on the orthopedic service in the past year, two observations were made repeatedly. The first was that skin temperature did not correlate in many instances with the oscillometric findings. The second was that an increased pulse wave on the involved side was noted in cases of chronic osteomyelitis, nonunion of fractures, and scarring and tissue damage severe enough to produce an obstruction to venous return.

To explain the first of these observations, namely, that skin temperatures and oscillometric readings do not

Fig 2—Oscillometric recordings of pulse waves in the arms of a patient who has ununited fractures of both bones of the left forearm and who has undergone multiple grafting procedures. The involved arm shows a decided increase in the oscillometer reading (at right in figure) but the skin temperatures of both arms are about the same.

correlate, we rely on the theory that skin temperature is governed by the heat regulating center of the body. Thus, the skin temperature will change as the body tries to gain or lose heat independently of the circulation to the deeper

structures. The second observation is more difficult to explain. Some observers feel that venous obstruction in some way interferes with the control of the vessels so that arterial blood is driven through the extremity with increased force, perhaps in an effort to overcome the damming-back effect of the venous block. Others feel that the increased pulsation is due to a "water hammer" effect, the pulse wave striking a stagnant blood column and the impulse being thus accentuated. At present, there is no satisfactory explanation for the phenomenon. Attempts to reproduce the finding by creating venous stasis with a tourniquet on the leg were unsuccessful, as was ligation of the femoral vein in a dog. Ligation of the iliac vein along with the popliteal vein in the dog produced increased amplitude of the pulsations, however, this was not permanent and did not occur in all instances.

The recording oscillogram is still in its infancy and considerably more study will be necessary before accurate interpretations of the readings are possible. It is the opinion of the staff in this department that, while the instrument may be useful diagnostically, its use at

present should be primarily experimental and that clinical judgment should take precedence in arriving at decisions about treatment.

SUMMARY AND CONCLUSIONS

A graphic method of recording extremity blood flow in orthopedic conditions is described. Results of studies on patients with poliomyelitis, osteomyelitis, fractures, vascular disturbances, and miscellaneous conditions are reported. The following conclusions are reached: 1. Patients with poliomyelitis show a decreased arterial circulation, which can be correlated, in most instances, to the decrease in the muscle mass and length on the involved side. 2. Skin temperature does not correlate with the oscillometric findings in many cases. 3. Venous stasis results in increased arterial pulsations on the involved extremity. 4. The recording oscillogram is a useful instrument that warrants further study. 5. Clinical judgment should take precedence in arriving at decisions about treatment.

ANTICOAGULANTS AND SYMPATHETIC NERVE BLOCKS IN THE TREATMENT OF VASCULAR LESIONS

EFFECTIVE THERAPEUTIC COMBINATION

Gerald H Pratt, M D, New York

When a major vessel, either an artery or a vein, is directly or indirectly traumatized, a reflex syndrome is established. This occurs whether the trauma is caused by an injury or is the result of a reflex initiated by a plaque on the lining of a diseased artery or a soft clot in a vein. The exact mechanism of the resultant action is not understood clearly. The synapse may occur (neurogenic theory) by afferent stimuli from the site to the cord and ganglia involved with efferent stimuli to the involved vessel and its collateral supply. The stimulus may cause a chemical reaction (chemical theory) in which a biological stimulus, such as epinephrine, sympathin, or spastin, is liberated into the blood stream to cause the effect. The mechanism is not important, it is sufficient to recognize that it occurs. An example of the action of this reflex protector is the flush of the face when one becomes angry or the pallor of fear. The inability of race horses to stand still at a starting gate is due to the nervous reflex tension built up by the excitement of the race and the increased blood supply in the legs. This reflex action is physiological and is one of nature's defenses against trauma. When a vessel is injured, nature causes a spasm that reduces or controls hemorrhage and that squeezes from the vessel all of the residual blood before it clots, therefore, if continuity of the injured vessel can be obtained again, the vessel will be open to carry the blood supply. At other times, this normal reflex becomes a pathological one. The clot or plaque on the intima may continue to cause the spastic reflex, and, thereby, initiate a chain reaction. This stimulus sets in action more spasm that in turn causes further development of the clot. This clot causes

more spasm in the affected vessel and in its collaterals, and a vicious circle is established.

There are two main points in the therapy of such abnormal spasm. One is to reduce the spasm itself, and the other is to prevent further clotting. In order to perform the first, the sympathetic chain reaction must be broken. The best place to achieve this is at a sympathetic ganglion. An easy way to achieve this is to perform a sympathetic nerve block. At the same time, and also thereafter, the tendency exists for the clot to propagate itself because the blood vessel has been damaged, the current has been slowed, and some permanent intimal changes are already present. The use of antithrombotic drugs at this stage will help to restrict the propagation of a clot and possibly will help to liquefy the ones that are already present.¹

It has been shown in animals that considerably more trauma is required to thrombose an artery that has anticoagulant substances in its blood. Similar experiments proved that a temperature lower than usual is required to cause blood sludging and frostbite if the anticoagulant factors are already present in the blood.² For several years, there has been a great fear of combining the two

types of therapy.³ Physicians have reported deaths from hemorrhage caused by sympathetic nerve blocks that were performed in patients who had hypoprothrombinemia from anticoagulants.⁴ Especially in the surgical field, surgeons feared such an event, and some physicians have stated that they would rather see their patients die of embolism than see them bleed to death.⁵ These views and statements vary so greatly from the experience and teaching of the Vascular Surgical Clinic, that I have reviewed all of the patients treated with anticoagulants and sympathetic nerve blocks, as well as the complications of that therapy.

At the clinic, we believe that there is no incompatibility in the two types of therapy. The physician directing the treatment must know the drugs, their action, and his patient's reaction to them, and he must use suitable safeguards in management. In addition, care must be taken in the technique of performing a sympathetic nerve block. While hemorrhage occasionally occurs, the few deaths reported have been due to technical errors in performing the block (tearing large vessels) and to hypoprothrombinemia, caused by excessive amounts of anticoagulants in the blood that were not taken into consideration.

Since 1945, the clinic has used these two methods simultaneously as a therapeutic measure. Sympathetic nerve blocks have been performed on 554 patients who were receiving antithrombotic drugs. From one to fourteen blocks have been performed on these patients, with an average of four to each patient. Thus there have been over 2,100 sympathetic nerve blocks done in this series. There has not been a single instance of postblock bleeding. It is significant that in the same period members of the clinic have been called in consultation to see three patients not receiving anticoagulant drugs in whom massive retroperitoneal hemorrhages developed after sympathetic nerve blocks. These three cases are significant. We believe that bleeding associated with nerve blocks is due to technical errors and is oftenest of traumatic origin. We do not believe that the simple puncture of a vessel in performing these blocks causes the serious hemorrhages reported. At times, before injecting the procaine hydrochloride, we have aspirated blood into a syringe, and, after replacing the needle, we have continued the block with no accidents. If a needle puncture would cause uncontrollable bleeding in a patient receiving anticoagulant therapy, there would be innumerable hemorrhages of the arm after blood is drawn for determination of prothrombin time and there would be bleeding from the slight nicks resulting from shaving. It is our thought that, if a severe hemorrhage is to occur, a large vessel has to be torn. In most nerve blocks, the vessel pierced is a lumbar vein. Unless this is torn into the vena cava, the large protecting iliopsoas muscle closes it off promptly.

Antithrombotic Drugs in Surgical Patients—It is of interest that between 1945 and 1952, 494 general surgical patients have been treated either therapeutically or prophylactically with antithrombotic drugs at the clinic. In this large group, there have been only nine hemorrhages (1.8%), six were the result of excessive doses of anti-

coagulant drugs and three were due to insecure wounds. In the same group of patients, one died. He had undergone surgery to achieve a spleno-renal shunt to relieve bleeding esophageal varices. Although he was receiving antithrombotic drugs, hypoprothrombinemia was at a safe level. The autopsy showed that ulcerated esophageal varices were the source of the bleeding. While we considered the drugs a possible factor in the bleeding, other patients have bled similarly when the varices ulcerated even though they were not receiving anticoagulant therapy. This patient's failure to stop bleeding when the hypoprothrombinemia was reversed was further evidence that the drugs were not the cause of the fatal bleeding.

Bleeding from Hypoprothrombinemia—In using drugs such as coumarin, there will be an occasional episode of bleeding due to overdosage, some laboratory error, or sensitivity to the drug. Therapy at such a time must be prompt and continuous. Fresh whole blood will supply the needed prothrombin. Blood from a blood bank, especially an old supply, will be less effective. This point must be understood, as most blood banks dispense the oldest blood first. Accidents have occurred from this cause alone. The prothrombin supplied by whole blood lasts from two to four hours before it is used up, the prothrombin time will rise again unless more is supplied. One cannot permit the prothrombin supply to be exhausted before a fresh supply is added.

In like manner, vitamin K will stop nearly all bleeding if given regularly and continuously. The vitamins K and K₁ are normal components of the body. If using the sympathetic naphthoquinones available, very large amounts must be administered. If vitamin K is used, it should be given intravenously in doses of from 64 to 72 mg. Some physicians have tried to control bleeding with small doses of vitamin K, sometimes even administering it by mouth, such therapy fails.

Synthetic substitutes for vitamins K and K₁ can supply only 40% of the basic needs of the body. Vitamin K₁ is available as an emulsion for intravenous use. It begins to change the prothrombin level in 15 minutes and reverses it in from 4 to 15 hours. Again, vitamin K₁ must be supplied regularly until the bleeding tendency is counteracted both clinically and microscopically. A mere drop in the prothrombin time is not proof that the danger is over. Therapy should be continued for at least 24 hours after all bleeding has ceased.

In a series of 1,170 patients treated at the clinic, anticoagulants were administered intravenously for 24 hours in 430 patients, for more than 24 hours in 35, and in massive doses in 28 (200 mg. heparin per cc.). Thirty-two patients were given a heparin preparation (Thrombocoid) intravenously, while 645 received no anticoagulants intravenously. In the same series, 758 patients were given bishydroxycoumarin (Dicumarol) parenterally, 360 were given ethyl biscoumacetate (Tromexan ethyl acetate), and 12 were given other anticoagulants in the same manner. Forty patients were not given anticoagulant medication by mouth. In our total of 1,170 patients, 494 had surgical wounds. The incidence of hemorrhage in this latter group was 1.8%, with a bleeding incidence of 0.4% in cases in which prothrombin time indicated a therapeutic but not an unsafe level.

SUMMARY AND CONCLUSIONS

It is likely that serious and fatal hemorrhages have been blamed on anticoagulant drugs, when lack of skill on the part of the person administering them was the true cause. We have been through the phase of dangerous and fatal anesthesia given by untrained interns and nurses. Thiopental (Pentothal) sodium or spinal anesthesia will kill in seconds if incorrectly administered. Patients have died from tension pneumothorax because someone did not know enough to aspirate the air from the pleura. Yet, we do not hesitate to use these anesthetics or to open the chest. We do, however, demand that the ad-

ministrator know the anesthetic and how to handle it. We also make certain that the postoperative period after thoracic surgery is correctly handled. As with other therapeutic modalities, the safety of anticoagulant drugs, as well as sympathetic nerve blocks, used singly or in combination, depends entirely on the ability and knowledge of the person who is administering them. If due precautions are exercised, these two complementary forms of therapy can be used together safely for the benefit of the patient.

CARCINOMA OF THE COLON COMPLICATING CHRONIC ULCERATIVE COLITIS

Elden C Weckesser, M D

and

Austin B Chinn, M D, Cleveland

The development of carcinoma of the colon in patients suffering from chronic ulcerative colitis has been the subject of much discussion since it was reported by Bagen¹ in 1928. This report comprises a brief review of the literature on the subject and the experience at University Hospitals of Cleveland during a 19 year period (1932-1950).

In the table is a summary of the reports in which the over-all incidence of carcinoma in patients with ulcerative colitis is given. The large number of cases reported by Lynn² constitutes a review of the literature up to 1945. Ten additional series found in the recent literature, in addition to our own cases, are also shown. The over-all incidence of carcinoma of the colon among 4,806 hospitalized patients with ulcerative colitis was 1.9%. The highest over-all incidence of carcinoma of the colon in ulcerative colitis was 6.3% among 95 children reported by Jackson, Bagen, and Helmholtz and included in the cases collected by Lynn². More recently, Felsen and Wolarsky³ reported that no carcinoma of the colon was found among 855 cases of ulcerative colitis. This is the largest series and the only recent report in which no carcinoma was encountered. Three series of less than 100 cases each were reported with no incidence of carcinoma prior to 1945.

Follow-up studies averaging 9.7 years were made by Sloan, Bagen, and Gage⁴ on 2,000 cases of ulcerative colitis seen at the Mayo Clinic from 1918 to 1938. Proved malignant disease was found in 88 (4.4%) of these cases. There were an additional 19 cases in which malignant lesions were suspected but were not proved histologically.

CASE MATERIAL

In the period from 1932 to 1950, 118 patients with ulcerative colitis were admitted to the University Hospitals of Cleveland. Four cases of carcinoma of the colon, an incidence of 3.4%, were diagnosed in this group. A fifth case was excluded because there was no clinical history of bloody diarrhea prior to admission. This patient was a 68-year-old white man admitted to the hospital after a 12 hour period of abdominal cramps

and vomiting. Laparotomy showed inflammation of the colon and a constricting lesion of the sigmoid. Pathologically the constricting lesion was a partially differentiated adenocarcinoma of the sigmoid with metastases to regional lymph nodes. The adjacent colon was the seat of chronic colitis. In spite of the pathological findings and the red, edematous appearance of the colon at surgery, this patient is not classified with the other four, since he did not have a definite clinical history of chronic diarrhea before surgery.

All four patients who had carcinoma of the colon were young (22, 29, 34, and 35 years old) when the disease was diagnosed. The average duration of symptoms prior to diagnosis of the malignant condition was 10.2 years (3, 9, 10, and 19 years respectively). Three cases were of the chronic, recurrent type of ulcerative colitis, and one was chronic sustained disease. Three patients had involvement of the entire colon, and in one the left half was involved. Two of the patients were men, and two were women. In one patient a second carcinoma was found in the remaining sigmoid colon at autopsy 17 months after surgery. All four had metastases to regional lymph nodes at the time of surgery, and two had pseudopolypoidosis. Three of the five carcinomas found in the four patients were adenocarcinoma and two were mucinous adenocarcinoma. Three lesions were in the sigmoid, one in the cecum, and one in the transverse colon. The longest survival after operation was 17 months. The other three patients died less than a year after operation, a fact that indicates the very serious nature of this complication.

From the departments of surgery and medicine, Western Reserve University and University Hospitals of Cleveland.

CASE REPORTS

CASE 1—A 34 year-old white man was admitted to University Hospitals of Cleveland on Nov 2, 1944. At the age of 14 he first noted diarrhea, and the condition was diagnosed as nonspecific ulcerative colitis. From that time the patient had many symptomatic exacerbations and remissions of varying duration and intensity. One and one-half weeks prior to admission to the hospital he experienced sudden, severe abdominal cramps accompanied by a visible and palpable "knot" in his abdomen. The cramping pains were intermittent and were accompanied by increase in the severity of diarrhea. The patient had lost an undetermined amount of weight and, on physical examination, was emaciated. There was a firm, fixed, supraclavicular node in the left side. The entire upper part of the abdomen was tender to pressure, and a visible, palpable mass appeared in the mid upper region of the abdomen every 10 minutes. This was accompanied by pain and gurgling. Intestinal obstruction was verified by a roentgenogram.

The patient was treated by intestinal intubation and supportive measures, and a barium enema showed a point of constriction in the mid transverse colon. Laparotomy with

was distended and diffusely tender. Roentgenograms showed distention of the colon to the sigmoid, and barium enema showed obstruction in this region.

At laparotomy the transverse colon was tremendously dilated. There was a constricting lesion in the upper sigmoid with considerable inflammation about it. Decompression was done, and, at a later operation, resection of the left colon with anastomosis of the hepatic flexure to the sigmoid was performed. The pathological report was partially differentiated papilliferous adenocarcinoma, with extension to adjacent tissues and regional lymph nodes, and ulcerative colitis. The patient was discharged from the hospital on Feb 23, 1947, but she died five months later from widespread metastases.

CASE 3—A 35 year old white woman was admitted to University Hospitals on Jan 16, 1949, with the complaint of an abdominal tumor complicating pregnancy. In 1940 she had first experienced the insidious onset of diarrhea, and in 1941, nonspecific ulcerative colitis involving the proximal colon was definitely established. Dysentery continued with minor remissions, and by 1942 the disease had progressed to involve the entire large bowel. In September, 1948, the patient first noted a persistent pain in the lower right quadrant of the abdomen. A tumor, believed to ovarian, became palpable in this location three months later. She was admitted to the hospital for laparotomy.

Physical examination showed, in addition to uterine enlargement consistent with a pregnancy of four and one half months, a tumor the size of an orange in the lower right quadrant, which was exquisitely tender. Abdominal exploration the day after admission revealed a mass involving the cecum, right colon, and right ovary and fallopian tube. These structures were removed and an ileotransverse colostomy performed. The pregnancy was interrupted by supracervical hysterectomy. Pathological diagnosis of the resected specimen was poorly differentiated carcinoma of the cecum with extension to the ovary, uterine tube, and regional lymph nodes. The resected ascending colon was the site of nonspecific ulcerative colitis. The patient had a stormy postoperative course, with development in the right flank of an abscess, which was incised. She was discharged improved but died 11 months later of carcinomatosis.

CASE 4—A 29 year-old white man was admitted to University Hospitals on Oct 1, 1949, with the chief complaint of chronic diarrhea of 10 years' duration. Examination showed that the patient was emaciated, dehydrated, and severely ill. The abdomen was distended and tympanitic, and roentgenograms showed diffuse involvement of the entire colon, with lack of haustrations and serrated margins of the barium column. He did not respond to medical treatment and, as a lifesaving measure, ileostomy was performed on Oct 14 with the patient under local anesthesia.

Recovery was slow postoperatively. The ileostomy wound broke down and healed very slowly. Plasma protein content dropped to 3.7 gm per 100 cc in spite of intensive parenteral therapy. The patient ate poorly and presented a severe psychiatric problem however, with tube feedings and finally with gastrostomy, his general nutritional state improved. Barium enema on March 16, 1950, revealed severe ulcerative colitis throughout the colon, with a constrictive lesion in the lower sigmoid.

Biopsy was positive for carcinoma March 20, and on March 27 the complete colon and rectum were removed, after which the patient made a satisfactory recovery. The pathological report was partially differentiated mucinous adenocarcinoma, with metastases to regional lymph nodes. The patient was discharged on May 21. He was readmitted to the hospital June 14 and died Aug 3, four and one half months after resection, with generalized abdominal carcinomatosis.

Undoubtedly delay in diagnosis occurred owing to masking of the symptoms of carcinoma by the ulcerative colitis. In retrospect, it can be said that he probably had a malignant lesion of the sigmoid colon at the time he was admitted, but this was not recognized until barium enema was given after improvement effected by ileostomy. The very malignant nature of this carcinoma is demonstrated by the short (four and one half months) survival after operation. Earlier ileostomy and colectomy might have saved this patient.

Reported Incidence of Carcinoma of Colon in Patients with Ulcerative Colitis

* A 0.06% incidence was estimated among an age group of the general population similar to that of the 118 cases in this report.

resection of the transverse colon was carried out on the 15th hospital day. The pathological diagnosis of the resected specimen was a well-differentiated, mucinous adenocarcinoma of the transverse colon with extension into the omentum and metastases to regional lymph nodes. There was also acute, chronic ulcerative colitis. The patient was discharged on the 38th hospital day.

On March 28, 1946, the patient was readmitted in an advanced state of cachexia and died on the 17th hospital day. At autopsy, in addition to widespread carcinoma in the upper abdomen, a separate, new, well-differentiated adenocarcinoma of the sigmoid with direct extension to the serosa was found. Today ileostomy and colectomy would have been done on this patient, although it is questionable whether the outcome would have been different, because of the advanced stage of the carcinoma of the transverse colon at the time of operation.

CASE 2—A 22-year-old white woman was admitted to University Hospitals on Jan 20, 1947, with the complaint of abdominal pain. For three years she had been subject to dietary upsets with nausea, vomiting, and diarrhea. One month before admission the patient noted abdominal pain and an occasional loose stool. This was soon followed by generalized abdominal cramps, nausea, vomiting, and diarrhea with 18 to 20 stools per day that persisted up to the time of admission. On examination the patient was emaciated and chronically and seriously ill. She was in severe pain, and her abdomen

COMPARATIVE INCIDENCE OF CARCINOMA OF COLON

In order to have some basis for comparison of the incidence of carcinoma among the hospital cases of ulcerative colitis, the incidence of carcinoma among the general hospital admissions was determined. In the five year interval 1946 to 1950 inclusive, there were 41,154 admissions to the combined general surgical and general medical services, where carcinoma of the colon was most likely to be seen. Of these patients, 262 (0.63%) had carcinoma of the colon. The fact that these persons were admitted to the hospital makes this an incidence of carcinoma of the colon among persons who already were ill. This figure is considerably smaller than either the 3.4% incidence in our series of patients with ulcerative colitis, or the 1.9% incidence among all collected cases of ulcerative colitis. From the U. S. Public Health Reports in 1944⁶ it is estimated that the incidence of carcinoma of the colon in an age group of the general population similar to the 118 cases of this report is 0.06%. This incidence is less than 1/50 of that among our cases of ulcerative colitis.

DURATION OF COLITIS AND CARCINOMA

More important than the over-all incidence of carcinoma in ulcerative colitis is the incidence of carcinoma among long-standing cases of the disease. It is in this category that prophylactic surgery may possibly be employed. Among our 118 cases, 23 patients had symptoms of ulcerative colitis for 10 years or more, and 2 of these (9%) had carcinoma. Conversely, 95 patients had symptoms of ulcerative colitis for less than 10 years, and 2 of these (2%) had carcinoma. Cattell⁶ states that among patients having ulcerative colitis nine or more years and treated surgically, carcinoma of the colon develops in one-third. Lyons and Garlock⁷ encountered nine malignant conditions (36%) among 25 surgically treated patients with ulcerative colitis of 12 years' duration or longer. Dennis,⁸ in discussing a paper by McKittrick and Moore, states that in 15% of the five-year cases, cancer of the colon develops.

Shands, Dockerty, and Bagen⁹ studied the clinical histories and pathological specimens of 73 cases of carcinoma of the colon complicating ulcerative colitis. The average duration of symptoms prior to the development of carcinoma was 15.3 years. In 75% of these cases ulcerative colitis had existed for more than 10 years prior to the development of malignant lesions. These authors conclude that the likelihood of development of secondary carcinoma in the large bowel in cases of ulcerative colitis increases with the duration of the disease, that quiescence of the disease for as long as 10 years gives no assurance against the development of carcinoma, that the prognosis is very poor when malignant lesions develop, and that, if improvement in prognosis is to be expected, colectomy must be performed as soon as the diagnosis is established.

COMMENT

Our patients with carcinoma of the colon were all under 35 years of age. The fact that carcinoma develops at an early age in patients with ulcerative colitis has also been noted by others,¹⁰ and the very malignant nature of the complication has also been noted.¹¹ The longest survival in our cases was 17 months after operation.

Lahey^{11a} reports only 2 living patients among 18, and in these 2 the diagnoses were made only by the pathologist after removal of the colon. Lahey believes the short survival is attributable to both the very malignant nature of carcinoma associated with an inflamed colon and late diagnosis because of masking of the symptoms of malignancy by the ulcerative colitis. Shands, Dockerty, and Bagen⁹ report two known five-year survivals among 73 cases, and Turnbull and Brown¹ recently reported two five-year survivals following removal of carcinoma of the colon in persons with ulcerative colitis.

The very short survival following removal of established carcinoma of the colon in patients with ulcerative colitis constitutes a serious problem. The colon must be removed before malignant disease develops if these patients are to be saved, but how can we detect those who may later have carcinoma? It seems, from our experience as well as that of others,¹³ that persons with severe, long-standing ulcerative colitis are susceptible to malignant change. Pseudopolyps are another probable predisposing factor, although this is not definitely proved. They were present in two of our cases of carcinoma. Shands, Dockerty, and Bagen⁹ found pseudopolyps in 75% of the patients with ulcerative colitis having multicentric carcinomas and in only 16% of those with a single carcinoma.

Lahey^{11a} advocates colectomy in all persons requiring ileostomy. The indications for ileostomy are acute exacerbation of disease not responding to medical therapy, hemorrhage, perforation, obstruction, joint involvement, multiple fistulas, and polyposis. Other excellent discussions of surgical indications in ulcerative colitis have also appeared.¹⁴

Our indications for ileostomy are acute or intractable disease not responding to medical therapy in a definite time interval, severe local complications such as hemorrhage, perforation, fistulas, and obstruction, and severe systemic complications such as arthritis and ulcerations of the skin and mucous membranes. Indications for colectomy are severe, long-standing ulcerative colitis, severe hemorrhage, perforation, polyps or carcinoma, and failure of ileostomy to control disease.

At present it is our opinion that persons with long-standing, severe ulcerative colitis who require ileostomy and those with polyposis should have prophylactic colectomy. This may be done in one stage.¹⁵ If the surgeon is not experienced with this type of operation, however, the multiple stage procedure is probably safer. The rectum should be removed if it is severely diseased. If left in place it should be examined endoscopically at least twice a year to detect the development of malignant disease.

Shands and others.*

We have had little success in reestablishing the continuity of the bowel after ileostomy, however, the rectal segment can be readily and completely inspected with a short proctoscope in the office, and it provides a possible means of restoring continuity of the bowel if the cause and cure of ulcerative colitis are established in the future. Colectomy may be not only a lifesaving procedure in malignant disease but also a means of preventing other local and systemic complications of ulcerative colitis.

Our experience with ileostomy in the treatment of ulcerative colitis has been comparable to that of McKittrick and Moore.^{14b} We have attempted always to gain psychological acceptance of the ileostomy by the patient prior to its performance. Most patients have gladly accepted an ileostomy and good health in place of the chronic invalidism of severe ulcerative colitis.

SUMMARY AND CONCLUSIONS

The incidence of development of carcinoma of the colon in persons with ulcerative colitis as reviewed in the literature is 1.9%. Among 118 patients with ulcerative colitis admitted to the University Hospitals of Cleveland, four (3.4%) also had carcinoma of the colon. All patients were 35 years old or less. The longest survival following surgery was 17 months.

The incidence of carcinoma of the colon among hospital patients in general surgery and general medicine over a five year period (1946-1950) was 0.6%. The estimated incidence of carcinoma of the colon in a similar age group of the general population was 0.06%. The average duration of symptoms of ulcerative colitis prior to development of malignant disease was 10.2 years. Among the patients who had ulcerative colitis 10 years or longer, the incidence of malignant disease was 9.0%.

The indications for ileostomy and colectomy are discussed. In view of the very serious nature of malignant disease as a complication of ulcerative colitis, the desirability of prophylactic colectomy in persons requiring ileostomy for long-standing, severe ulcerative colitis and in persons with pseudopolypoidosis is discussed.

There is a significant incidence of carcinoma of the colon in patients with ulcerative colitis, and the incidence rises with the duration of ulcerative colitis. Carcinoma of the colon complicating ulcerative colitis has a very poor prognosis. Prophylactic colectomy is indicated in persons requiring ileostomy for long-standing, severe ulcerative colitis and in those with pseudopolyps.

10465 Carnegie Ave (Dr Weckesser)

Rupture of the Bladder—Rupture of the urinary bladder is not a serious injury if recognized promptly and treated properly. If neglected, however, the reverse is the case. In any injury involving the pelvis or the spine, or a sudden crushing injury or fall which would result in a change of hydrostatic pressure, such a possibility must be recognized. The surgeon should always inquire if the patient had a full bladder at the time of injury. Accurate diagnosis may be made by relatively simple measures, such as blood in the urine, the passage of a catheter with negative results, and failure to obtain the return of simple sterile water or saline solution inserted into the bladder. Catheterization should always be performed in patients with back, abdominal, or pelvic injuries. A rupture of the bladder may be temporarily treated until further aid can be obtained by leaving the catheter *in situ* or establishing a simple suprapubic drainage. It is an injury all too often overlooked.—F B Berry, M D, Trauma and the Urinary Bladder, *A M A Archives of Surgery* May, 1953

CLINICAL NOTES

MEDIASTINAL LIPOMA SIMULATING CARDIAC ENLARGEMENT

A M Gottlieb, M D

L J Baer, M D

and

Prescott Jordan Jr, M D, Detroit

This case of a mediastinal lipoma is reported because, by its location and shape, it so closely simulated cardiac enlargement. Mediastinal tumor is not usually considered in the differential diagnosis of enlargement of the cardiac silhouette. Lipomas are uncommon intrathoracic neoplasms. Thirty-five of the 56 intrathoracic lipomas reported to date were in the mediastinum,¹ and only two of these lipomas were confused with cardiac enlargement. One was in Yater and Lyddane's series,¹⁴ and the other was presented by Sosman and Levine at a clinic during the annual meeting of the American College of Physicians in Boston in 1949.

REPORT OF A CASE

A 30 year old white man who was an automobile salesman was admitted to the hospital on Jan 10, 1952. On admission, the diagnosis cardiac enlargement with cause undetermined was made. The patient had been recalled to active duty as a Navy fighter pilot. During the routine physical examination prior to his induction, a chest roentgenogram showed cardiac enlargement, therefore, he was rejected from active Navy duty. He was referred to the hospital so that the cause and nature of the cardiac enlargement might be determined. The patient had always considered himself to be in good health and had no complaints. He gave no history of rheumatic fever, hypertension, syphilis, angina pectoris, hyperthyroidism, or nephritis that might explain the cardiac enlargement. A chest roentgenogram of the patient's chest, taken when he was discharged from the Navy in July 1946, apparently showed nothing abnormal. The patient had had a chest roentgenogram taken by a mobile x-ray unit a year prior to admission, and he was informed that it disclosed nothing unusual. An attempt to obtain this roentgenogram was unsuccessful. He had never had an electrocardiogram prior to admission. There had been no change of weight in the past few years. Review of the patient's habits, family history, past illnesses, and a review of symptoms by systems failed to reveal any additional information.

On examination the patient appeared well developed and well nourished, and he did not appear ill. The blood pressure was 110 mm Hg, systolic, and 82 mm Hg, diastolic. The pulse, temperature, and respirations were normal. The physical examination revealed nothing abnormal except that the apex beat was not visible, it was weakly palpable at the left midclavicular line when the patient was placed in the extreme left lateral position.

To the left, there was an increase in percussion dullness that extended to the anterior axillary line in the fifth intercostal space. The heart sounds were faint at the apex and were loudest at the second intercostal space just right of the sternum. There was an accentuated aortic second sound. Auscultation of the heart failed to reveal murmurs or pericardial friction rubs. The cardiac percussion findings were unchanged by altering the position of the patient. On percussion the heart was not enlarged to the right, and there was no sternal heave. Funduscopic examination failed to reveal arteriosclerosis or hypertension. There was no clinical evidence of increased venous pressure, tracheal tug, pulsus paradoxus, or Ewart's sign.

Laboratory studies, including urinalysis, complete hemogram, Kahn complement fixation, basal metabolism, liver function, tuberculin tests, and test for echinococci, all gave normal results. The venous pressure was 39 mm of water. Dehydrocholic acid (Decholin) circulation time was 15 seconds. An electrocardiogram gave normal results.

A routine chest roentgenogram was interpreted as revealing cardiac enlargement (fig 1), however, because of reasons that are discussed later, more extensive roentgenographic studies were undertaken. The initial impression from fluoroscopic examination was that the cardiac shadow appeared to be enlarged to the left. With barium in the esophagus, however, it was noted that on rotation, the ventricular margin cleared the spine sufficiently to indicate that there was no left ventricular enlargement. There was no deviation of the esophagus. The lateral border of the cardiac shadow had diminished pulsations. In the left side of the heart shadow, there was a poorly defined margin that appeared to be where the left cardiac border should be and that displayed active pulsation. The lungs were clear.

Fig 1—Cardiac shadow appears enlarged in roentgenogram of the chest on admission.

The radiologist's final statement was that the shadow represented an epicardial mass inseparable from the left ventricle and that this mass was probably a tumor, a cyst, or a collection of fluid. A laminogram of the chest revealed a large tissue mass that appeared to arise from the left border of the heart in the region of the left ventricle. An upper gastrointestinal roentgenographic study failed to disclose a diaphragmatic hernia that could account for the chest shadow.

The patient's chest was explored surgically by one of us (P J) on Feb 15, 1952. In the anterior mediastinum, attached to the pericardium and beneath the pleura, there was a lipoma that was excised. This lipoma measured 18 by 11 by 8 cm. Microscopic study of the tumor revealed normal adipose tissue. The patient's postoperative course was uneventful, and he was discharged on Feb 22, 1952. A postoperative roentgenogram of the chest presented a normal cardiac silhouette (fig 2).

Fig 2—Cardiac shadow appears normal in roentgenogram of the chest after surgery.

COMMENT

Although this patient was admitted to the hospital with a diagnosis of cardiac enlargement, it was suspected, from the asymptomatic course and the absence of causative factors, that the apparent cardiac enlargement was either an extracardiac anomaly or a cardiac tumor.

The increased cardiac dullness with obliteration of the apical impulse and the faint heart sounds raised the question of pericardial effusion. There were, however, several factors that seemed to contradict this diagnosis, such as absence of elevated venous pressure, paradoxical pulse, electrocardiographic changes, or Ewart's sign and increased dullness to the right or left in the second intercostal space. Furthermore, the cardiac shadow remained the same radiographically whether the patient was erect or supine. On the basis of evidence available, it appeared that the lesion was more likely to be in the pericardial space than in the myocardium and more likely to be solid than fluid. It was the consensus of those who saw this patient that the mass was most likely a myxoma, but that a cystic neoplasm or parasitic cyst should be considered.

One of us (A M G), on the basis of the similar case presented by Sossman and Levine, suggested the diagnosis of mediastinal lipoma. Sossman emphasized the increased transparency of the lipoma shadow when in com-

parison to the usual dense cardiac shadow Heuer,^{1c} in his series of cases, also brought out the fact that, in a roentgenogram, the shadow cast by a lipoma is characteristic Storey and Knutson,² in their case report, bring out the fact that, in a roentgenogram, fatty tumors cast shadows having a density midway between air and water, and they also state that 25% of mediastinal tumors are malignant, thereby emphasizing the necessity of early surgical intervention

The increasing incidence of routine and survey chest roentgenograms will lead to more frequent detection of lipomas as asymptomatic opacities. Positive identification will be accomplished only by exploratory thoracotomy or postmortem examination. The possibility of sarcomatous changes that demand immediate and complete excision has been stressed by several reports of malignant changes occurring in preexisting benign lipomas.³ The symptomatology in the reported cases varied from no symptoms, as in our case, to dyspnea, cough, and cyanosis, depending on the size, the location, and the structures distorted. The amount of fat and, therefore, the mobility and fluidity of the tumor govern the ability of the tumor to adjust to the surrounding structures rather than to obstruct or displace them.

SUMMARY

A case of mediastinal lipoma is reported because, by its location and shape, it so closely simulated cardiac enlargement. The characteristic roentgenographic evidence, the possibility of sarcomatous changes, and the necessity for surgical exploration are stressed. The differential diagnosis of cardiac enlargement rarely includes mediastinal lipoma, therefore, it is hoped that this report will cause this tumor to be considered in the diagnostic approach to enlargement of the cardiac silhouette.

Exposure Treatment of Burns—In children the nutritional state remains more nearly normal with treatment by the exposure method, largely because fear of painful changing of dressings and subsequent unwillingness to eat are eliminated. Better nutrition, the early use of whole blood transfusions to combat shock and the absence of the loss of blood entailed in changes of dressings helped to maintain the content of hemoglobin in the blood. However, frequent examination of the blood is as necessary as when any other form of therapy is used. The amount of skin grafting required is essentially the same as that needed when the pressure dressing method is employed.

Infants and young children should be hospitalized for the exposure method. Cooperative, intelligent older children and adults can have minor burns successfully treated by the exposure method as ambulatory patients outside the hospital. The exposure method is limited by the distribution of the burn, but not by its depth or extent. It was impossible to obtain adequate eschars over circumferential burns of the trunk and quite difficult to obtain them in cases of encircling burns of the extremities. Generally the exposure method should not be used in such cases. The exposure method is readily adaptable to burns limited to one surface of the body. It is particularly useful in treating burns of the face and perineum,⁴ as pressure dressings are difficult to apply in those areas and rapidly become soiled.—W. S. Kiskadden, M.D., and S. R. Dietrich, M.D., Evaluation of Exposure Treatment of Burns, *California Medicine*, December, 1952

BENIGN ULCER OF THE ESOPHAGUS ASSOCIATED WITH CHRONIC ACETANILID POISONING

William L. Wolfson, M.D.

and

Morris W. Greenberg, M.D., Brooklyn

The majority of benign esophageal ulcerations are believed to be peptic erosions analogous to peptic ulcer of the stomach and duodenum. This tenet is emphasized by the high incidence of esophageal ulcers in diaphragmatic herniations of the stomach in which the loss of the pinch-cock mechanism allows regurgitation of gastric juice into the esophagus. Another cause of esophageal ulcer is pressure from aneurysms or intubations. The disease has also been ascribed to infectious disorders, exanthematous fevers, debilitating diseases, and uremia. In reviewing the literature of esophageal ulcers for the past 20 years, however, we were unable to discover any report that this condition occurred as a sequel to drug poisoning. Therefore, the case we present of an esophageal ulceration presumably developing in a patient suffering from chronic acetanilid poisoning should be of general interest.

Chronic acetanilid poisoning is not so frequent now as it was 50 years ago, when the drug was used oftener and its widespread effects were not generally appreciated. Nevertheless, isolated reports have appeared on occasion to remind us of the dangers of the uncontrolled use of this medicament. The drug, as taken, is usually self-prescribed for chronic headache and is repeated by the patient at frequent intervals. After a variable period, there is some degree of habituation, and the user notices increasing headaches, for which he consumes more and more of the medicament. These larger doses in themselves induce headaches, thus a vicious circle is established.

The prominent symptoms of chronic acetanilid poisoning are cyanosis, dyspnea, and weakness. These are all attributed to anoxemia, the cause of which is disputed. Whether oxygen want is due to methemoglobinuria, sulfhemoglobinuria, or to one of the intermediate products derived from acetanilid is not considered in this paper. Cyanosis is constant and is of a bluish or blue-gray, slate color. After discontinuance of the drug, the user's color may not return to normal for several days.

The kidneys are affected in about 5 to 8% of the cases, irritation is manifested by albuminuria with or without red blood cells in the urine. With the use of large doses of acetanilid, an increase in urea and total nitrogen of 30 to 35% is not unusual, however, pathological examination of the kidneys at autopsy is not startling, it shows only cloudy swelling. As there is some effect on the kidneys, it is presumed that preexisting, chronic nephritis or other renal damage might enhance the toxic effect of acetanilid.

Blood studies usually reveal anemia with a decrease in the red blood cell count to about 3 million per cubic millimeter, an increased reticulocyte count, and erythropoiesis of the bone marrow. Polycythemia has been reported by Stengel¹ in one case. On the other hand,

Van Loon and Clark² demonstrated hemolytic anemia in the dog. Platelet counts are normal and are only rarely increased. Bleeding and coagulation times are not abnormal.³ It is not uncommon, in patients suffering from chronic acetanilid poisoning, for capillary fragility to be evidenced by the development of ecchymoses after slight trauma. Agranulocytosis is not a feature of chronic acetanilid poisoning, although there are reports of agranulocytosis resulting from the use of combinations of acetanilid and aminopyrine. The depressing action on the white blood cells is attributed to the aminopyrine, which is a known causative agent, whereas acetanilid alone has not shown this feature.

The gastrointestinal tract is generally not harmed by acetanilid. Significantly, autopsy reports only rarely describe gastrointestinal changes such as a catarrhal condition of the mucosa and an occasional capillary hemorrhage. In one fatal case of acute poisoning the patient passed sheets of mucous membrane and two large clots of blood through the anus 48 hours before death.⁴ The presence of esophageal ulceration in a case of chronic acetanilid poisoning, therefore, becomes an important and unexpected occurrence.

REPORT OF A CASE

A 53-year-old white housewife was admitted to the hospital on Oct 31, 1951, complaining of severe dysphagia, epigastric pain, and hematemesis of one day's duration. For the preceding two years, mild dysphagia had been manifested by difficulty in swallowing large particles of food. Soft foods and liquids were swallowed with ease and frequently a glass of water was utilized to facilitate the passage of more bulky foods. Nevertheless, the patient ate a varied and adequate diet. No previous roentgenographic studies had been made. She had lost 5 lb (2.3 kg) in six months. There were no other symptoms related to the gastrointestinal tract except for chronic constipation. Her other complaints were of persistent headaches since childhood and lumbar backaches over a period of about 10 years. There was a constant feeling of fatigue, and she experienced dyspnea at the least exertion. She had never menstruated and had never become pregnant. Her blood pressure had been elevated for more than 10 years. The patient remarked that for years she had bruised easily and always had at least one ecchymotic spot on her body. She was questioned in regard to drug intake and admitted at this time to taking an occasional headache powder, although later she admitted consuming many more. On the day before admission, the patient suddenly suffered moderate epigastric pain accompanied by a complete inability to swallow anything, even water. She vomited blood, and this continued through the night until her admission.

Physical examination at that time revealed a much dehydrated, acutely ill patient. Her color was striking, it was a peculiar slate gray pallor somewhat resembling argyria, but bluer in cast. Examination of the heart, lungs, and abdomen showed nothing remarkable. Blood pressure was 190/110 mm Hg.

Laboratory studies showed a hemoglobin level of 12 gm per 100 cc or 77% red blood cell count 3,810,000 per cubic millimeter, white blood cell count 9,650 differential count within normal limits, no abnormal cells and 276,000 platelets. Prothrombin time was 26 seconds, control was 15 seconds. Bleeding time was 2 minutes and 45 seconds and the coagulation time was 5 minutes. Kahn test was negative. Urinalysis showed specific gravity 1.008, 1+ albumin, an occasional red blood cell, and many white blood cells. Blood chemistry figures were glucose 148 mg per 100 cc and blood urea nitrogen 51 mg per 100 cc. The next day blood chemistry studies showed glucose 187, urea nitrogen 44.5, and creatinin 1.8 mg per 100 cc.

Roentgen study of the esophagus the morning after the patient's admission revealed an apparent organic obstruction in the mid third of the esophagus. The roentgenologist in-

terpreted the obstruction as suggestive of a neoplasm at that level (fig 1). For three days, food and liquids could not be given by mouth, and intravenous feeding was instituted consisting of glucose in isotonic sodium chloride solution and amigen and blood transfusions. Vitamins were given parenterally, 5 mg of vitamin K, 100 mg of vitamin C, and one ampul of liver extract were given daily. Penicillin, 300,000 units, was given twice a day. The patient vomited on the first day after admission, but this was not repeated thereafter. On the third day after her admission, liquids, which were given orally, were swallowed without difficulty. After seven more days a soft diet was prescribed and retained.

On Nov 6, 1951, a week after the patient's admission, esophagoscopy was performed. A marked annular narrowing of the esophageal lumen in the middle and lower thirds was revealed. This narrowing was circular and not completely obstructing but it was impossible to pass the instrument beyond the lesion. The mucosa was thickened, grayish, ulcerated,

Fig 1—Preoperative esophagram showing obstruction in the middle third

and firm when cut. At the time, the physician performing the esophagoscopy believed that the lesion was neoplastic. A biopsy was taken and reported as chronic inflammatory tissue. Unexpectedly, the biopsy gave no evidence of malignancy, but it was not considered conclusive, for negative biopsies of some esophageal neoplasms are not uncommon.

Those in attendance of the patient felt that a direct investigation of the esophagus as a diagnostic measure was necessary. On Nov 12, 1951, the 12th day after her hospitalization, the patient underwent a right thoracotomy performed through the sixth intercostal space. The esophagus was mobilized in its lower half and, during this procedure, the left

vagus was resected. This portion of the esophagus was investigated carefully; no induration or thickening was discernible by inspection and careful palpation. No enlarged glands were palpable in the area of the lower half of the esophagus and around the hilum of the right lung. A moderate amount of straw-colored fluid was seen in the pericardial sac. The chest was then closed and a Pezzar catheter inserted for underwater drainage.

On the first postoperative day, liquids were given orally and were swallowed without difficulty. The postoperative course thereafter was essentially uneventful. The catheter in the pleural cavity was removed on the sixth postoperative day. Blood studies on the second day after the operation showed a urea nitrogen of 43 mg and creatinin of 3.6 mg per 100 cc, both returned to normal nine days later. The urine concentration test, made 11 days postoperatively, showed a specific gravity of 1.008, and excretion of phenolsulfonphthalein was 13% in the first specimen and 11.5% in the second specimen.

Fig 2—Postoperative esophagram showing patent esophagus

Another series of roentgenograms of the esophagus was taken 15 days postoperatively and showed a patent, smooth esophagus with no evidence of obstruction. The barium flowed evenly and rapidly through the lumen (fig 2). Over the two week convalescent period, the blue-gray color of the patient's skin gradually disappeared, and the usual pallor of secondary anemia became evident. The patient was discharged from the hospital on the 16th day after surgery.

In the follow up examinations, persistent hypertension was noticeable, the blood pressure varied from 260/150 to 220/120 mm Hg and was considered as a probable or contributory cause of her chronic headaches. The urine showed albuminuria, many casts, and occasional red blood cells. Capillary fragility was definite. Bleeding time was 8 minutes, and coagulation time was 6 minutes. Red blood cell count was 3,700,000 per cubic millimeter, hemoglobin 66% (10.5 gm per 100 cc), platelets 220,000, prothrombin time 15 seconds, and clot retraction time one hour. The plasma vitamin C level was 0.31 per 100 cc (normal 0.7 to 1.4 mg per 100 cc). Urea nitrogen was

12 mg and creatinin 1.1 mg per 100 cc. Urea clearance was 82.9% of normal. The complaint of dysphagia had disappeared completely and had not returned.

During these office visits, the patient stated that the headaches that had bothered her since adolescence had now almost completely disappeared. Further close interrogation revealed that she had been taking 6 to 10 headache powders called "Yum" daily for the past six years. Each powder contained 3.5 grains (0.22 gm) of acetanilid and 0.25 grain (0.015 gm) of caffeine alkaloid. This meant that she had ingested at least 20 grains (1.29 gm) of acetanilid daily. The usual toxic dose varies greatly, but disagreeable symptoms are likely to result from single doses larger than 4 grains (0.26 gm). There is much individual variability, however, in toxicity to this drug.

COMMENT

The patient in the case reported showed symptoms of acetanilid poisoning such as blue-gray cyanosis, dyspnea, weakness, mild anemia, and capillary fragility. Also present were hypertension and chronic nephritis, as well as mild dysphagia of two years' duration that suddenly became complete.

The cause of the esophageal ulcer in this case must be considered. In view of the varied diet that included an ample amount of citrus fruit, a diagnosis of avitaminosis was not probable, although an isolated vitamin C determination in the plasma one month after operation was low. In view of this finding, it is conjectured that acetanilid might have had some effect on the absorption and level of vitamin C. This may explain the frequent ecchymosis in cases of chronic acetanilid poisoning. It has been stated that, although vitamin C deficiency in guinea pigs may cause minute hemorrhages and even ulceration of the gastrointestinal tract, study of human material shows that the gastrointestinal tract is largely spared.⁶ Uremia was considered, but esophageal ulcers usually occur in the terminal stages of a severe azotemia; this was excluded in view of the moderate increase in the nitrogenous waste in the patient's blood analysis and because of her rapid recovery in the hospital. The azotemia may be explained on the basis of acetanilid irritation superimposed on a chronic nephritis boosted by gastrointestinal bleeding that might also have served to elevate the nitrogenous blood elements.

Roentgen study of the esophagus and stomach ruled out diaphragmatic hernia as a cause. The ulcer in this case was higher than usual peptic ulcers of the esophagus that are localized to the lower third of the gullet.

In view of these facts, we feel that it is not presumptuous to consider this as possibly an esophageal ulceration secondary to acetanilid poisoning. In favor of this concept is the disappearance of the ulcer and dysphagia, as well as the cyanosis, dyspnea, and weakness on the discontinuance of the acetanilid ingestion.

SUMMARY

Chronic acetanilid poisoning is not common but should be considered whenever unexplained cyanosis is present. Its manifestations are essentially blue-gray cyanosis, dyspnea, and weakness, as well as secondary anemia and capillary fragility. A case of chronic acetanilid poisoning is reported in which an esophageal ulcer developed. It is believed that this hitherto undescribed complication might be ascribed to the chronic ingestion of acetanilid.

SUBACUTE BACTERIAL ENDOCARDITIS TREATED WITH CHLORAMPHENICOL AND OXYTETRACYCLINE

Guillermo Garrido Lecca, M D

and

Alfredo Tola, M D, Lima, Peru

The use of penicillin has modified considerably the treatment and the end-results of subacute bacterial endocarditis. When the broad spectrum antibiotics came into use, hopes were fulfilled for reducing even further the mortality figures of this malady. Friedberg¹ considered the theoretical possibility that 95% of the cases of endocarditis could be cured. Unfortunately, this has not been the case.² There are still more than 5% of cases that must be considered therapeutic failures. On the other hand, the frequency of the disease seems to be decreasing,³ perhaps due to the widespread use of the antibiotics. One of the reasons for the failures of the new antibiotics in the treatment of subacute bacterial endocarditis seems to be the fact that these drugs are primarily bacteriostatic and not bactericidal.⁴ The following report is that of a case of subacute bacterial endocarditis cured by the use of chloramphenicol and oxytetracycline (Terramycin) in which the isolated micro-organism was *Streptococcus viridans* resistant to penicillin, streptomycin, and aureomycin.

REPORT OF A CASE

A 30 year-old engineer was admitted to the hospital on Dec 20, 1950, complaining of fever of six months duration. On July 26, 1950, after a seafood dinner, the patient had a severe attack of urticaria, nausea, and vomiting, with no fever. Three days later, he noticed malaise, anorexia, and headache, and discovered that he had fever. He consulted his physician who told him that he had an infection of his mouth and referred him to a dentist, who extracted three infected teeth. The fever did not disappear, and the patient began to notice small, tender, red spots on the hands. After four days of no change, he again consulted his physician who told him that he had an endocarditis and prescribed aureomycin. The patient took only six capsules because he felt better and the fever disappeared for five days. He then felt tired and the fever came back, he decided to come to Lima where he consulted a cardiologist. He was told that he had endocarditis and was given 300,000 units of penicillin daily for one month. The fever went away after four days of therapy, and the patient felt very well. After this treatment was completed, he went back to work in a mining camp for three weeks, when again malaise, headache, and fever developed. A physician was seen, and the patient received aureomycin, two capsules three times a day for two weeks, after which he thought that he was cured. He remained symptom-free for almost a month, but then all the symptoms reappeared. The patient came back to Lima to see another physician who prescribed penicillin, 1 million units a day, and streptomycin 1 gm daily for a period of two months. This treatment was continued only for two weeks because rash, chills, nausea, and vomiting developed. The patient then repeated the previous therapy of aureomycin, two capsules three times a day for a total of 8 gm, after which he was symptom free for a few weeks. When the fever returned, the patient decided to come to the hospital.

The past history revealed that in 1936 he was operated on for chronic sinusitis. In 1940 he had an attack of jaundice that was followed by a few joint pains for about 15 days. At that time no mention was made of any disorder of the heart by the attending physician. In 1942 the patient was examined and told for the first time that he had an aortic insufficiency, but he ignored this and had led a normal life up to the time of the present illness. Physical examination revealed a well-developed and

well nourished man in no distress. The skin showed a few petechiae of the chest, abdomen, and left hand. In the right hand, there was a tender, red nodule over the thenar eminence. The lungs were normal. The heart was enlarged 1 cm to the left of the midclavicular line. On auscultation, there was a pre-systolic rumble at the apex and a loud diastolic murmur over the aortic area. There was also a marked Corrigan's pulse. The rest of the examination was essentially normal. The blood pressure was 160/40 mm Hg, pulse 94, temperature 99.8 F, and respirations 20.

A urinalysis and serologic examinations were normal. Hemoglobin was 9.4 gm per 100 cc (photoelectric colorimeter method), red blood cell count 3,800,000, and the white blood cell count 6,200, with 80% neutrophils. The blood smear showed hypochromic red blood cells. The hematocrit was 34%. The blood urea nitrogen was 24 mg per 100 cc. Agglutinations for typhoid, paratyphoid A and B, and *Brucella* micro-organisms were negative. The blood culture taken on admission was reported, on the third day, positive for *Streptococcus viridans*.

In the hospital, the patient was first given 5 million units of penicillin a day by the intramuscular method. On the fourth day another positive blood culture was obtained. There was no change in temperature, and on the eighth day he received 5 million units of penicillin by continuous intravenous administration, to which he had a severe reaction with chills and high fever. He was then given aureomycin, 2 gm daily. With this

cillin resistant to 1 unit per cubic centimeter, streptomycin resistant to 20 μ g per cubic centimeter, aureomycin resistant to 10 μ g per cubic centimeter, chloramphenicol (Chloromycetin) sensitive to 3 μ g per cubic centimeter, and oxytetracycline sensitive to 1 μ g per cubic centimeter. The patient was then given oxytetracycline, 2 gm a day, plus chloramphenicol, 2 gm a day, for a period of three weeks, at which time he left the hospital to continue the same therapy for two more weeks. The dose was then reduced to 1 gm of oxytetracycline and 1 gm of chloramphenicol a day for two weeks. Four days after the above mentioned therapy was begun a blood culture was negative, and since then eight different blood cultures have been negative, four of which have been taken after all medication had been discontinued.

The patient has been followed regularly at the outpatient department for 14 months, and there has been no sign of recurrence. Findings of physical examination have remained about the same as at the time of admission except for the absence of petechiae. He has shown an increase in weight of 20 lb (9.1 kg). The patient is now working and living a normal life.

COMMENT

This report probably represents another case of subacute bacterial endocarditis that was due to *Str. viridans*, which became resistant to antibiotics by their improper use, thus constituting a therapeutic problem. In the present case, penicillin and aureomycin were used without avail, but the sensitivity test showed that the isolated micro-organism was sensitive only to chloramphenicol and oxytetracycline. Reports have appeared in the literature on the combined use of antibiotics and of their antagonistic and synergistic effect. These were followed by several investigations in vitro and in animals, and even in patients, indicating that there was a definite antagonism between certain groups of antibiotics. In this case, we decided to use both chloramphenicol and oxytetracycline in the hope of obtaining an additive effect of the two drugs since there was no reported antagonism. The result was a dramatic sterilization of the blood with no recurrence of the infection up to the present time.

Results in cases of subacute bacterial endocarditis treated with the new antibiotics have not been very encouraging. Because of the lack of bacteriocidal power, there is a considerable percentage of recurrences and therapeutic failures. Recently, Ahern and Kirby found a case of endocarditis due to *Str. viridans* in which penicillin and chloramphenicol had a synergistic effect in vitro. The treatment with these drugs resulted in complete recovery of the patient, while all of the previous investigations seemed to indicate that there is a definite antagonism between these two antibiotics.

Evidence is beginning to accumulate that it is impossible to give absolute rules for the use of antibiotics, and, as Jawetz points out,⁵ a fixed synergism or antagonism does not exist. The physician must depend on the laboratory tests to determine which antibiotic or combination should be used in the treatment of infection. Further research is needed to establish the exact effect of antibiotics on the metabolism of bacteria. It is possible to speculate that by using two different antibiotics, the physician is interfering with two different aspects of bacterial metabolism, and two bacteriostatic drugs can produce a bactericidal effect when used simultaneously. In the treatment of subacute bacterial endocarditis, therefore,

one should look not only for the synergistic effect among Jawetz' group 1⁶ of antibiotics, but also for the additive effect among the members of group 2, namely aureomycin, chloramphenicol, and oxytetracycline.

SUMMARY

A case of subacute bacterial endocarditis is reported in which the responsible micro-organism was *Streptococcus viridans*. Penicillin and aureomycin were used without effect. On sensitivity tests the isolated micro-organism was resistant to penicillin, aureomycin, and streptomycin, but was sensitive to chloramphenicol (Chloromycetin) and oxytetracycline (Terramycin). The patient was treated with chloramphenicol and oxytetracycline, with complete recovery resulting. Attention is called to the fact that, although some evidence exists of the antagonism between certain antibiotics, an in vitro test should always be done in the treatment of infections until a more complete knowledge of the mechanism of action of the antibiotics is known.

DERMATITIS DUE TO TRIETHYLENE MELAMINE THERAPY

Abraham M. Frumin, M.D.

and

A. I. Rubenstone, M.D., Philadelphia

The administration of triethylene melamine (TEM) in various hematological disorders has led to the widespread use of this drug since it was introduced in 1951.¹ The usual side-effects have been manifested by a toxic depression of the marrow, i.e., anemia, thrombocytopenia, leukopenia, and gastrointestinal disturbances, with nausea and vomiting. We wish to present what appears to be the first recorded instance of a dermatitis due to such therapy.

REPORT OF A CASE

A 57-year-old white woman was admitted to the Albert Einstein Medical Center, Southern Division, Medical Service No. 1, because of weakness of six months' duration associated with a 50 lb (22.7 kg) weight loss. Dyspnea on exertion was recently noted. Fever and night sweats were not present. Physical examination revealed blood pressure to be 132/80 mm Hg, pulse 82, respirations 18, and temperature 98.6 F. There was no pallor, icterus, splenomegaly, purpura, or glossitis. Generalized adenopathy and marked hepatomegaly were present. Blood studies showed red blood cells 4 million, hemoglobin, photoelectric method, 12.8 gm per 100 cc (82%), reticulocytes 0.8%, platelets 280,000, white blood cells 10,900 with 67% segmented cells, 28% lymphocytes, 1% monocytes, 3% eosinophils, and 1% basophils. Urinalysis was normal. Blood sugar was 92 mg per 100 cc, and blood urea nitrogen was 11

From the Department of Research and Medicine, Albert Einstein Medical Center, Southern Division.

Dr. J. M. Rueggesser of Lederle Laboratories Division, American Cyanamid Company, furnished the triethylene melamine used in this patient.

1. Karaofsky, D. A. and others. Triethylene Melamine in the Treatment of Neoplastic Disease. *A M A Arch Int Med* 87:477-516 (April) 1951.

mg per 100 cc The total protein level was 8.5 gm per 100 cc with 5.3 gm of albumin and 3.2 gm of globulin, serum bilirubin was 1 mg per 100 cc Sulfobromophthalein (Bromsulphalein) test showed 65% retention in 45 minutes, thymol turbidity 27.5, and prothrombin activity 82% The sternal marrow was normal Megakaryocytes were present in normal numbers, and platelet production appeared adequate Granulopoiesis was normal and orderly in maturation and occurred in slightly increased numbers Erythropoiesis was normoblastic in nature and occurred in normal numbers No foreign cells were seen These findings were interpreted as showing non-specific granulocytic hyperplasia

A biopsy of an axillary node showed almost complete replacement of the normal architecture by masses of neoplastic cells These were polygonal and slightly pleomorphic, with a moderate amount of cytoplasm and large vesicular nuclei Scattered mitoses were present The cells were arranged as irregular branching cords in a delicate collagenous and reticular framework In areas, there was a denser, sheet like arrangement The pathological report diagnosis was reticulum cell sarcoma

The patient was given triethylene melamine, 3 mg a day for five days No effect on the lymph nodes or liver were observed Another course was instituted five days after the last dose of triethylene melamine Five milligrams per day was given for three days She became nauseated, vomited, and complained of anorexia on the third day following the last dose of triethylene melamine A maculopapular rash developed over the upper extremities involving the trunk, both shoulders, and extending down the arms to the wrists Marked pruritus was present Oral antihistaminic therapy and various analgesic lotions were of little benefit

The patient never had any episode similar to this previously She did not receive any other medication during this time The rash persisted for approximately one week and then gradually disappeared Blood studies made during this time were essentially unchanged from those on admission The subsequent course of the patient was downhill, and she died on her 42nd hospital day Autopsy showed extensive reticulum cell sarcoma infiltration of all organs

COMMENT

The various toxic manifestations of triethylene melamine therapy have usually involved the hematopoietic and gastrointestinal systems Various anemias, thrombocytopenias, and neutropenias have been described¹ The individual response to this drug has necessitated careful observation of the patient during such therapy The gastrointestinal complaints have usually been related to signs of toxicity, but these are not always constant

The onset of dermatitis in this patient was first noted when she had nausea, vomiting, and anorexia The rash itself was maculopapular in nature, confined primarily to the upper extremities and trunk, and was associated with a marked pruritus Lotions offered only slight relief, and no response to antihistaminic therapy was noted The rash persisted for approximately seven days before it disappeared completely without any residuals Since the patient had not received any other medication during this episode and never had any previous skin eruption, we believe that this represented a true drug reaction to triethylene melamine

SUMMARY

The first reported instance of dermatitis due to triethylene melamine therapy is presented

that men lere

Chaucer

On June 6, 1822, at Fort Mackinac, Mich, a shotgun was accidentally discharged The resultant explosion jarred the entire scientific world and awakened echoes that have rolled down through the decades to the present A Canadian lad, aged 18, had collapsed His name was Alexis St Martin When he recovered from shock 30 minutes later, his eyes met the sympathetic countenance of the fort surgeon, William Beaumont The powder and duck shot had entered the boy's left side one yard from the muzzle of the musket Penetrating posteriorly, the eruption passed obliquely forward and inward, tearing away the integument and muscles the size of a man's hand It blew off the anterior part of the sixth rib, fractured the fifth, lacerated the lower part of the left lobe of the lung and left side of the diaphragm, and perforated the cardiac portion of the stomach Food eaten at breakfast had mingled with bloody mucus and filled the wound Beaumont was convinced that his patient could not live long During the subsequent 10 days, the trapper's course was stormy and he had a high fever and fetid slough But in four months his condition was improved

"The lad is now [September, 1824]" said Beaumont in reporting his studies in the *Medical Recorder*¹ "in perfect health and says he feels no inconvenience from the wound, except the trouble of dressing it He eats as heartily and digests as readily as he ever did, is strong and able bodied, performing any kind of labor from that of a house servant to that of chopping wood or mowing in the field He has been in my service since April, 1823, during which period he has not had a day's sickness sufficient to disqualify him for his ordinary duties He will drink a quart of water or eat a dish of soup and then by removing the compress can immediately throw it out through the wound On removing the dressings, I frequently find the stomach inverted to the size and about the shape of a half-blown damask rose, yet, he complains of no pain, it will return itself, or is easily reduced by gentle pressure When he lies upon the opposite side, I can look directly into the cavity of the stomach, observe

¹ Beaumont, W A Case of Wounded Stomach *Am. M. Recorder*
8:14 1825

its motion and almost see the process of digestion I can pour in water with a funnel, or put in food with a spoon, and draw them out again with a syphon I have frequently suspended flesh, raw and roasted, and other substances in the hole, to ascertain the length of time required to digest each, and at one time used a plug of raw beef instead of lint, to stop the orifice, and found that in less than five hours it was completely digested off, as smooth and even as if it had been cut with a knife." Beaumont had thus discovered laboratory conditions ideal for studying the physiology of the stomach through an opening three inches in circumference just below the left nipple Alexis' stomach had become both a theater and a test tube, which the great Beaumont attentively and thrillingly observed for the next eight years

In January, 1826, according to the *Medical Record*² the experiments were still in progress "On the first of August, 1825, at 12 00 o'clock noon, I introduced through the perforation between the ribs into the stomach of Alexis St. Martin, the following articles of diet, suspended by a silk string and fastened at proper distances from each other, so as to pass in without giving pain, to wit a piece of high seasoned alamode beef, a piece of raw salted lean beef, a piece of raw salted fat pork, a piece of raw lean fresh beef, a piece of boiled corned beef, a piece of stale bread, and a bunch of raw cabbage, each piece containing about two drachms The lad continued his usual domestic employments about the house

1 o'clock p m —Withdrew and examined them, found the cabbage and bread about half digested, the pieces of meat unchanged Returned them into the stomach

2 o'clock p m —Withdrew them, found the cabbage, bread, pork and boiled beef all cleanly digested and gone from the string, the other pieces of meat but very little affected Returned them into the stomach again

3 o'clock p m —Withdrew them, found the alamode partly digested and the raw beef slightly macerated on the surface, but its general texture firm and entire The fluids of the stomach smell and taste slightly rancid Lad complains of some pain and uneasiness of the breast Returned them again "

With fiery enthusiasm Beaumont performed several hundred experiments, which were often fatiguing to Alexis, who was obliged to lie in one position for long periods of time The great physiologist had proved what others thought they had discovered a century later, that the stomach juices are formed in the walls of the stomach, through a hand lens he saw the juices collecting at the orifices of the glands in the mucous membranes, the juices appearing only with the stimulation of food Foreign bodies do not incite this formation of gastric juice He distinguished gastric juice from saliva and mucus present in the stomach He found that gastric juice is acid and that its digestive property is due to something besides acid (It remained for Schwann to discover pepsin in 1835) As the quantity of food is increased the formation of gastric juice is enhanced Beaumont also studied the time of digestion of different types of foods and noted how oils and fats retard stomach emptying and how starches pass from the stomach more rapidly than

other foods He observed the contractions of the body of the stomach at the beginning and those of the pylorus at the end of digestion The manner in which hunger is relieved by the insertion of food directly into the lumen of the stomach and the way gastric secretion is suppressed or absent in states of anger, impatience, and fever, are his classical discoveries

It can be said without hesitation that these observations form the basis of modern gastric physiology Nor is it redundant to add that it is to the genius of this humble Beaumont working in the wild forests of Michigan, a thermometer, sand bath, piece of string, and simple surgical instruments his only tools, and armed alone with a liberal amount of determination and inquisitiveness that inspired such men as Walter Cannon, Ivan Pavlov, A J Carlson, Betram Sippy, Arno Luckhardt, Walter L Palmer, Sidney Portus, Lester Dragstedt, Henry Bockus, A C Ivy, Sir William Osler, Harvey Cushing, the Mayos, and an army of medical persons the world over

William Beaumont descended from a family of French Huguenots He was born in Lebanon, Conn, in 1785, the same year as that illustrious founder of medical colleges, Daniel Drake He taught school in Lake Champlain, took a preceptorship in medicine with Dr Benjamin Chandler at St Albans, Vt, and became an army surgeon in the War of 1812 These were the days when the family physician charged 25 cents for a home visit and \$3 50 for obstetric care Beaumont remained at Fort Plattsburg, N Y, for a short while, until he was transferred by his lifelong friend, the then Surgeon General, Joseph Lovell, to Fort Mackinac, Mich (called Michillimackinac) Here he married Deborah Green, a widow from Plattsburg, N Y, who was as inspiring to her husband as Grace Revere Osler was to Sir William Three days after Alexis' famous accident, Sarah, "beautiful Tasey," as Gen Robert E Lee nicknamed her, was born The other children were Lucretia, born at Fort Howard near Green Bay, Mich, and Israel, born at Fort Crawford, Prairie du Chien, Wis As for Alexis, he absconded in 1829 while the Beaumonts were visiting Plattsburg, but returned after much persuasion for the continuation of experiments at Prairie du Chien

In 1833 Beaumont published his "Experiments and Observations on the Gastric Juice and the Physiology of Digestion" in a plain tersely written volume Shortly after, its importance was properly appreciated in Ireland and Germany Even today it is replete with suggestions for research Beaumont made his permanent residence in St Louis and, after a fall on icy pavement, which resulted in an abscess on the head, died in April, 1853 He is buried at Belle Fontaine cemetery, St Louis, beside his wife, and not far from the intrepid explorer of the Far West, William Clark Not only an able scientist, he was a beloved practitioner with a wide following in St Louis, revered for his noble character by his fellow physicians, and a devoted father and husband He vigorously fought injustice and calumny, and had in addition a shrewd business ability The St Louis University Medical School was originally the Beaumont Medical School Pilgrimages have been made to his grave by the St Louis Medical Society from year to year

2 Beaumont W Further Experiments on the Case of Alexis San Martin Am M Recorder 9 94 1826

In his preface to "Experiments and Observations" appears a great quotation of medical history "I submit a body of facts which cannot be invalidated. My opinions may be doubted, denied or approved according as they conflict or agree with the opinions of each individual who may read them, but their worth will be best determined by the foundation on which they rest—the incontrovertible facts." And again, "Truth like beauty when unadorned is adorned the most." In his notebook, now at the Washington School of Medicine, St. Louis, he wrote "Of all the lessons which a young man entering upon the profession of medicine needs to learn, this is perhaps the first—that he should resist the fascination of doctrines and hypotheses till he has won the privilege of such studies by honest labor and faithful pursuit of real and useful knowledge."

Alexis St Martin lived long after the death of his master, near Montreal, in a state of poverty. He had 17 children, 4 of whom reached adulthood. He displayed his fistula in various parts of the country and had offers to exhibit it in Paris and London. When he died in 1880, Sir William Osler attempted to secure the stomach for the Army Medical Museum, but the St Martin family responded by exposing the body to putrefaction and then burying it in an eight foot deep grave.

The Ethan Allen Beaumont collection is a marvelous store of relics and letters belonging to the great surgeon and his immediate family. It was discovered in 1936 by Dr Arno Luckhardt and bequeathed to the University of Chicago, where part of it is on permanent display at Billings Library. This, added to the precious materials preserved at the Washington University School of Medicine, constitutes memorabilia that properly should be exhibited like an art treasure everywhere in the country to radiate the spirit of a great American physician.

Prognosis in Hypertension—The character or severity of a hypertensive patient's symptoms, other of course than those which point to cardiac or renal failure, give little clue to his subsequent fate. Headache for example, has occurred as often in mild as in severe cases. Again, it might well have been expected that the transient cerebral attack ascribed to 'angiospasm' would prove to be a curtain raiser for the subsequent full-length drama of a stroke, but this has not been the case, and the incidence of such cerebral episodes was no higher among patients who subsequently had strokes than in those who did not. Since in addition neither a family history of hypertension nor the existence of a renal basis for the hypertension appears to influence prognosis unduly, assessment of a hypertensive patient must rest fundamentally upon objective findings.

Early recognition of the accelerated form of hypertensive disease is particularly desirable, since it is in this type of case that sympathectomy has most to offer, and operation performed in time may completely transform its character. Appropriate cases, however, will not be selected for sympathectomy unless the practice is adopted of submitting every hypertensive patient under the age of 50 to a systematic assessment with the object of establishing how far the disease has already progressed, for only by relating this to the age of the patient can it be decided whether or not the speed of advance has been excessive.—A W D Leishman, D.M., *Observations on Prognosis in Hypertension*, *British Medical Journal*, May 23, 1953.

CHEMICAL LABORATORY

Following is the first of several reports on cigarette cigarette smoke, and filters by the Chemical Laboratory of the American Medical Association. The work was done by the Laboratory at the request of the Advertising Committee of the American Medical Association. Many of the technical details of the work, which was carried out by Mr Robert R Stark of the laboratory staff, have been omitted in this presentation and can be obtained upon request from the Chemical Laboratory.

WALTER WOLMAN, PH D Director

A STUDY OF CIGARETTES, CIGARETTE SMOKE, AND FILTERS

1 Filter-Tip Cigarettes

Considerable interest has been expressed concerning the effectiveness of filter-tip cigarettes and the so-called denicotinizing process in reducing the amount of nicotine and tars in cigarette smoke. Because of the scarcity of published data on the subject, the Chemical Laboratory of the American Medical Association has undertaken a study of nicotine and tars in the smoke of filter cigarettes, special low-nicotine cigarettes and 'regular' cigarettes and the effectiveness of filter holders in removing nicotine and tars from cigarette smoke. This first report will deal only with the effect of the filters of the three largest selling filter tip cigarettes. They represent the three types of filter tips on the market, namely, paper, asbestos, and cotton. During the course of this investigation changes were made in the filters of each of the three brands, either to improve the filtering efficiency or to change the smoking characteristics of the cigarette. The cigarettes with the original filters are designated as A-1, B-1, and C-1, and the cigarettes with modified filters are designated as A-2, B-2, and C-2 in table 1. A 'regular' all tobacco cigarette, brand D, was also tested. These experiments are not designed to interpret such qualities of cigarettes as flavor, aroma, or smoking characteristics.

As stated by Bradford, Harlan, and Hanmer,¹ a laboratory smoking process should be sufficiently like human smoking to allow acceptance of the data collected, and it must be reproducible. Puffing the cigarette by mouth with an absorption apparatus placed between the cigarette and mouth meets the first requirement, but is not reproducible. Continuous suction applied to the cigarette as employed by Bogen,² Koperina,³ and others is far from meeting the first requirement as the intensified heat produced from the long incandescent coal changes the composition of the smoke. Constant suction interrupted at timed intervals by a stopcock or valve has been employed by Baumberger,⁴ Bogen,² Jensen and Haley,⁵ and others. This method is open to criticism because the volume of puff varies between cigarettes, depending on differences in tightness of packing. Moreover, the volume increases significantly in each cigarette as the smoking proceeds and the air resistance decreases as the cigarette becomes shorter.

These objections are overcome by a constant volume smoking device, such as that described by Pfyl,⁸ in which the cigarette was puffed by air displacing mercury in a tube as the mercury level was lowered by means of a leveling bulb. Pfyli,⁷ using Pfyli's apparatus to smoke oriental cigarettes to a 15 mm butt, taking 40 ml puffs every 30 seconds, found 19 to 27% of the nicotine in the mainstream smoke (smoke emerging from the puffed end of the cigarette), 37 to 47% in the sidestream (smoke rising from the burning tip), and 13 to 17% in the butts, with a total recovery of 74 to 85% of the nicotine. The remainder of the nicotine is apparently decomposed by the heat of the coal.

The cigarettes in the present tests were smoked with the automatic smoking machine described by Bradford, Harlan, and Hanmer.¹ This is a constant volume smoking device in which the mercury is replaced by water as the operating fluid. The smoke is passed through a glass tube and collected by gravity deposition in a 300 ml flask to which only two supplementary bubblers are attached. These are specially designed to reduce the back pressure to about two inches of water

length, that is from a 30 mm to a 10 mm butt, the nicotine appearing in the smoke of each cigarette increases from 13 mg to 38 mg. These variables may be eliminated by assigning fixed values to each of them. The results of the smoking experiments will depend on the values selected, but under any given set of conditions comparisons between cigarettes and comparisons in the effectiveness of filter tips are made possible.

The smoking conditions adopted by the A M A Laboratory are those of Bradford and co-workers.¹ In this process 47 mm of each cigarette is smoked (two-thirds of a "standard" 70 mm cigarette) using 35 ml puffs of two seconds' duration taken once a minute. The size of the puff is considered reasonable in view of Pfyli's observation that puffs varied among individuals from 27 to 61 ml. The time between puffs is sufficiently long to allow the cigarette to return to a free burning state and to prevent the formation of an unnaturally long and hot coal.

In addition to the variables encountered in the smoking process certain variables are inherent in the cigarettes them-

* Placed in this column for comparison with full length cigarettes

The smoking machine itself consists of a constant level reservoir that supplies water to a buret equipped with a glass float. Four cigarettes are smoked simultaneously by taking a puff from each in succession. This is accomplished by motor driven valves timed by a clock motor. During the puff, suction created by the emptying buret draws air through the cigarette. The puff is terminated when the falling water level seats the glass float in a ground glass constriction at the bottom of the buret.

In smoking, a large number of variables are encountered. Six of these listed by Pfyli are rapidity of the puff, time of the puff, volume of the puff, number of puffs, duration of smoking, and the length of the butt. The effect of the length of the butt on the nicotine content of the smoke is confirmed by Jensen and Haley,⁹ who have shown that as a 70 mm cigarette is smoked from four-sevenths to six-sevenths of its

length, and the results of the experiments will depend to a certain degree upon them. Variations in type, weight, cut,⁸ and tightness of packing of the tobacco may be expected. By careful selection of cigarettes based on their weight, some of these variations can be minimized but they cannot be eliminated completely.

Five cigarettes were smoked for each single determination. The smoking of a larger number of cigarettes (up to 50) did not produce more reliable or consistent results, and the sheer volume of smoke was difficult to collect without losses. The average weight of each lot of cigarettes was determined and only those cigarettes weighing within 20 mg of this average were smoked to eliminate gross differences in amount of tobacco and tightness of packing. The cigarettes were smoked in a room maintained at 77° F (25° C) and 45% relative humidity.

The mainstream smoke was collected and the nicotine in the smoke determined by the method of Bradford, Harlow, Harlan, and Hanmer.¹⁰ The smoke was collected in a 300 ml Kjeldahl flask containing 5 ml of alcohol and 5 ml of alcoholic 0.5 N sulfuric acid. The smoke was not bubbled through the solution, but the large free space above the solution

8 Wenusch A. Influence of the Width of the Cuttings on the Passage of the Nicotine into the Main Smoke Stream. *Ztschr f. Untersuch d. Lebensmitt* 75:182-184, 1938.

9 Bradford J A, Harlow E S, Harlan W R, and Hanmer H R. Nature of Cigarette Smoke Volatile Bases and Acids. *J Indust Engin Chem* 20:45-50, 1937.

allowed the smoke to settle undisturbed by subsequent puffs. The effectiveness of gravity deposition of smoke obviated the need for a long absorption train. The two supplementary bubblers filled with glass beads and containing 5 ml of alcoholic 0.5 N acid and 5 ml of aqueous 0.5 N acid, respectively, trapped any nicotine not collected in the flask.

The smoke solution was rendered alkaline and the nicotine steam distilled into a dilute acid. The nicotine was then precipitated as the silicotungstate.

The nicotine content of the tobaccos of each of the brands of cigarettes smoked was also determined. The method used was that of the Association of Official Agricultural Chemists.¹⁰

In separate runs, tars were determined by again collecting the smoke by gravity deposition over 25 ml of 0.1 N sulfuric acid in the 300 ml Kjeldahl flask. The two bubbler tubes, loosely packed with asbestos held in place with cotton plugs, were placed between the flask and the smoking machine. Upon completion of a run, the smoke was allowed to settle 20 minutes and then the smoke tube and bubbler tubes were washed into the flask with chloroform. The material in the flask was extracted with chloroform. The chloroform was evaporated, and the tars were dried for three hours at 100° C.

The results of the experiments are given in tables 1 and 2 and in the graph. Table 1 lists the type of filters tested, the physical characteristics of the cigarettes and filters, and the percentage of moisture and nicotine found in the tobacco. Table 2 and the graph give the results obtained from the smoking of the cigarettes. It should be noted that the weights of nicotine and tars found in cigarettes and their smoke will vary in different lots of the same brand of tobacco. The amount of nicotine in the smoke is a function of the amount of nicotine originally present in the tobacco. The nicotine content of tobacco is subject to great variations, depending on the position of the leaf on the plant, weather conditions during the growing season, type of tobacco, region of growth, and cultural practices. The nicotine content of different brands of cigarettes will vary, depending on the blend of tobaccos, and cigarettes of the same brand may vary considerably if the manufacturer's controls are poor or nonexistent.

In table 2, column 2, the figures are obtained by multiplying the average number of puffs required to smoke the cigarette to the 47 mm mark by the volume of each puff (35 ml) and represent the average volume of smoke sucked into the absorption train. This mainstream smoke represents the smoke that presumably would reach the smoker's mouth. Columns 3 and 4 of table 2 show the weight of nicotine in this smoke with the filters removed and intact, respectively. The percentage reduction in nicotine in the mainstream effected by the filter is listed in column 5 and is based on the difference between columns 3 and 4.

In columns 8 and 9 of table 2, the weights of the tars appearing in the mainstream smoke per cigarette are given without and with the filters attached, respectively. Column 10 lists the reduction in tars in the mainstream effected by the filter. These figures are based on the difference between columns 8 and 9 and are in close agreement with the figures in column 5.

The figures on reduction in nicotine and tars in columns 5 and 10 favor the filters and are deceptive because the figures for nicotine and tars in the mainstream smoke listed in columns 3 and 8 were obtained from the short cigarettes resulting from the removal of the filters. Tobacco itself is a rather good filter, and, if the filter tips were to be replaced by an equal length of tobacco the mainstream smoke from the resulting all tobacco cigarettes of brands A, B, and C would contain less nicotine and tars than are listed for the shortened cigarettes in column 5 and 10, because the tobacco replacing the filter-tips would remove a certain amount of these substances.

This laboratory has found that, if the paper filter of brand A-1 is replaced by 11 mm of tobacco, the additional tobacco will remove 8% of the nicotine and tars from the mainstream smoke. This is comparable with the 9% reduction in nicotine and 5% reduction in tars effected by the paper filter of brand A-1. Similar reductions might be expected to occur in columns

5 and 10, table 2, for brands B and C if the removed filter-tips were replaced by equal lengths of tobacco.

In the graph, the distribution of the nicotine from the smoked portion of the cigarette is shown for the brand 2 series of filter-tips and the all tobacco cigarette brand D. Comparisons between brand D and other members of the series are difficult to make when the initial nicotine contents of the smoked portions of the cigarettes are different as shown by differences in the total lengths of the bars. A comparison between brand D and brand A-2 can be made because the initial nicotine contents of the smoked portions of the two cigarettes are very nearly equal. It can readily be seen from the graph that the amount of nicotine in the mainstream smoke from the two cigarettes is almost identical. It is also apparent that the amount of nicotine filtered by the tobacco of the butt of cigarette brand D is almost as great as the amount of nicotine filtered by the tobacco remaining in the butt plus the filter of brand A-2. It is interesting to note from the graph that although the total amount of nicotine trapped by the filter of brand C-2 is greater than that trapped by the filter of brand B-2, the percentage efficiency is lower (column 5 of table 2). This is a direct result of the fact that the tobacco of brand C-2 has a larger nicotine content in the portion of the cigarette smoked, and consequently the concentration of nicotine in the smoke passing through the C-2 filter is greater than that passing through the B-2 filter.

Since the amount of nicotine that reaches the smoker's mouth is of primary importance, the practical ineffectiveness

Distribution of nicotine from smoked portion of four brands of cigarettes

of the filter of brand C-2 is demonstrated by the length of the bar that measures the nicotine in the mainstream smoke. Brand C-2 contains more nicotine in this portion of the smoke than any other brand shown in the graph. Brand C-1, an earlier product of the same brand name, showed an even larger amount of nicotine in the mainstream smoke.

Columns 6 and 7 table 2, show the percentage, expressed as the nearest whole number of the total nicotine in the smoked portion of the tobacco that is transferred to the mainstream smoke without and with the filters. In column 6 the figures are again shown for the shorter cigarette resulting from the removal of the filter. To compensate for the shorter cigarette, corrections may again be used here that are based on the substitution of a length of tobacco equal to the length of the filter. They are proportional to the corrections that may be applied to columns 5 and 10 and would reduce the figures in column 6 by about 2%.

The figures in column 6 show that the proportion of nicotine transferred from the smoked portion of the cigarette to the mainstream smoke is surprisingly constant. If a 2% correction were applied to compensate for the shorter cigarettes, the values would range from 19 to 23%. These corrected figures would be in close agreement with the work of Bradford and co-workers.⁹ The values in column 7 for brands A-1, A-2, C-1, C-2, and D agree closely with one another and with the corrected values for the cigarettes without filters.

These values and the bars of the graph indicate that the filters are responsible for removing very little of the total nicotine in the smoked portion of the cigarette. The bulk of this nicotine, about 75% in the case of "regular" cigarettes, is lost in the sidestream or is destroyed by the burning coal.

On the basis of results obtained in the smoking experiments, it can be seen that the over-all effectiveness of the filters of brands A and C is not significant. Indeed, it can be seen from column 4 of table 2 and from the graph that the nicotine content of the mainstream smoke of brand C is exceptionally high—higher than that of "regular" cigarettes. The filter of brand B-1 is the most effective in removing nicotine and tars from the mainstream smoke. However, the sample of later manufacture, brand B 2, is much less effective, as the filter is more loosely packed, apparently in an effort to improve the smoking qualities.

In all cases the fraction of nicotine removed by the filter from the smoked portion of the cigarette is small. Even in a "regular" cigarette with no filter tip only 21% of the total nicotine reaches the smoker in the mainstream smoke. In recent advertisements calculations have been contrived to advance claims for very low percentages of nicotine in the mainstream smoke. Widely divergent values can be obtained from the same analytical data choosing different bases for the calculations. For example, an extremely low value can be obtained by basing the calculation on the total weight of the cigarette. Using this stratagem in calculating, the figure 0.25% nicotine in the smoke of the "regular" cigarette, brand D, is obtained. Thus an apparently low figure is obtained from a normal nicotine content.

COUNCIL ON PHARMACY AND CHEMISTRY

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

R T STORMONT, M D, Secretary

Dimethyl-Tubocurarine Chloride—*Mecostrin Chloride* (Squibb)— $C_{16}H_{18}ClNO_4$ —M W 723.71—O Methyl *d*-tubocurarine chloride—Dimethyl ether of *d* tubocurarine chloride—The structural formula of dimethyl tubocurarine chloride may be represented as follows:

Actions and Uses—Dimethyl-tubocurarine chloride has the same actions and uses as dimethyl tubocurarine iodide and tubocurarine chloride except that the efficacy of the methylated derivatives in the treatment of spastic diseases has not yet been determined (See the monographs on dimethyl tubocurarine iodide and tubocurarine chloride.)

Dosage—Dimethyl tubocurarine chloride has approximately the same ratio of potency as dimethyl tubocurarine iodide when compared with tubocurarine chloride, but on the basis of the difference in the molecular weights of the two salts, 0.8 mg. of dimethyl tubocurarine chloride provides a dose equivalent to 1 mg. of the iodide. Like the iodide, dimethyl-tubocurarine chloride is administered only by slow intravenous

injection over a period of 30 to 60 seconds. For muscle relaxation in surgery, the average initial dose for adults is 2 to 3 mg. If needed, 1 to 1.5 mg. can be added in 3 to 5 minutes. After 45 minutes an additional dose of 1.5 to 2 mg. may be administered. With ether anesthesia the dose of dimethyl tubocurarine chloride should be about one third that used with other anesthetic agents. For shock therapy and manipulative therapy the average dose is calculated on the basis of 0.025 mg. per pound of body weight, using 1 mg. less than this amount for the initial dose in adults. The safe upper limit of dosage is 0.037 mg. per pound of body weight. As a diagnostic agent in myasthenia gravis, the dose is one fortieth to one tenth of the adult shock therapy dose (i.e., 0.0006 to 0.0025 mg. per pound of body weight), administered intravenously. The test should always be terminated within 2 or 3 minutes by the intravenous injection of 1.5 mg. of neostigmine methyl sulfate with 0.6 mg. of atropine sulfate. The same precautions and contraindications should be observed as with other purified derivatives of curare.

Tests and Standards—

Physical Properties Dimethyl tubocurarine chloride is a white odorless, crystalline powder. It decomposes with evolution of gas when heated to about 236°. It is soluble in water and diluted sodium hydroxide, sparingly soluble in alcohol and diluted hydrochloric acid, very slightly soluble in chloroform and practically insoluble in benzene and ether.

Identity Tests Prepare a solution of about 50 mg. of dimethyl-tubocurarine chloride in 30 ml. of water. To 5 ml. of the solution add several drops of nitric acid and 1 ml. of silver nitrate T.S. a curdy white precipitate forms that is soluble in ammonia T.S. (presence of chloride). The solution also responds to the second, third and fourth identity tests in the monograph for dimethyl tubocurarine iodide.

The specific rotation $[\alpha]_{25}^{20}$ of a solution of 0.25 gm. of dimethyl-tubocurarine chloride in 50 ml. of water is between 185 and 195.

A 0.005% solution of dimethyl tubocurarine chloride prepared as directed in the assay in the monograph for dimethyl-tubocurarine iodide, exhibits an absorption maximum at about 2800 Å [specific absorbancy $E(1\% \text{ 1 cm.})$ about 89].

Purity Tests Dry about 0.3 gm. of dimethyl-tubocurarine chloride accurately weighed in a vacuum at 60° over phosphorus pentoxide for 4 hours. The loss in weight is not more than 14.0%.

Assay (Dimethyl tubocurarine Chloride) Transfer 25 mg. of dimethyl tubocurarine chloride accurately weighed to a 500 ml. volumetric flask and proceed as directed in the spectrophotometric assay in the monograph for dimethyl tubocurarine iodide starting with ' ' add 10 drops of hydrochloric acid.

The concentration of the final solution (0.005%) in mg./ml. = optical density at 2800 Å — 8.9. The amount of dimethyl tubocurarine chloride present is not less than 98.0 nor more than 102.0%.

(Nitrogen) Transfer about 0.2 gm. of dimethyl-tubocurarine chloride accurately weighed to a semimicro Kjeldahl flask and proceed as directed in the assay for nitrogen in the monograph for dimethyl-tubocurarine iodide starting with ' ' digest it with 7 ml. of sulfuric acid. The amount of nitrogen present is not less than 3.60 nor more than 3.90% equivalent to not less than 93.0 nor more than 100.8% of dimethyl tubocurarine chloride.

Dosage Forms of Dimethyl tubocurarine Chloride

SOLUTION Identity Tests The solution responds to the identity tests in the monograph for dimethyl tubocurarine iodide.

Assay (Dimethyl tubocurarine Chloride) Transfer to a 50 ml. beaker an exactly measured volume of solution equivalent to about 5 mg. of dimethyl-tubocurarine chloride and proceed as directed in the assay for dimethyl-tubocurarine iodide solution starting with ' ' and carefully evaporate it to dryness. The concentration of the final solution (0.005%) in mg./ml. = optical density at 2800 Å — 8.9. The amount of dimethyl tubocurarine chloride present is not less than 95.0 nor more than 105.0% of the labeled amount.

E R Squibb & Sons, Division of Matheson Chemical Corporation, New York.

Solution Mecostrin Chloride 10 cc vials. An isotonic salt solution containing 1 mg. of dimethyl tubocurarine chloride in each cubic centimeter. Preserved with 0.9% benzyl alcohol.

Aluminum Hydroxide Gel U.S.P. (See New and Nonofficial Remedies 1952, p. 306).

Physicians' Drug & Supply Company, Philadelphia.

Tablets Dried Aluminum Hydroxide Gel 0.3 and 0.65 gm.

Cortisone Acetate (See New and Nonofficial Remedies 1952, p. 322).

Schering Corporation, Bloomfield, N. J.

Tablets Cortogen Acetate 5 mg.

Dihydrostreptomycin U.S.P. (See New and Nonofficial Remedies 1952, p 130)

The Upjohn Company, Kalamazoo, Mich

Dihydrostreptomycin Sulfate 5 cc and 20 cc vials Dihydrostreptomycin powder equivalent in activity to 1 gm and 5 gm, respectively, of dihydrostreptomycin base

Solution Dihydrostreptomycin Sulfate 2 cc and 10 cc vials A solution containing dihydrostreptomycin sulfate equivalent in activity to 0.5 gm of dihydrostreptomycin base in each cubic centimeter Preserved with 0.25% phenol

Diphtheria and Tetanus Toxoids with Pertussis Vaccine Combined, Alum Precipitated (See New and Nonofficial Remedies 1952, p 398)

U S Standard Products Company, Woodworth, Wis

Aquagen Diphtheria and Tetanus Toxoids and Pertussis Vaccine Alum Precipitated 1.5 cc (one three-dose immunization) and 7.5 cc (five three-dose immunizations) vials Each cubic centimeter contains 30,000 million H pertussis organisms Preserved with thimerosal 1:10,000

Diphtheria and Tetanus Toxoids with Pertussis Vaccine, Combined (See New and Nonofficial Remedies 1952, p 397)

U S Standard Products Company, Woodworth, Wis

Diphtheria and Tetanus Toxoids with Pertussis Vaccine, Combined 1.5 cc (one 3-dose immunization), 7.5 cc (five 3-dose immunizations), and 22.5 cc (fifteen 3-dose immunizations) vials Each cubic centimeter contains 60,000 million H pertussis organisms Preserved with thimerosal 1:10,000

Diphtheria Toxoid, Alum Precipitated U.S.P. (See New and Nonofficial Remedies 1952, p 384)

U S Standard Products Company, Woodworth, Wis

Aquagen Diphtheria Toxoid (Alum Precipitated) 5 cc (five 2-dose 0.5 cc immunizations) and 10 cc (five 2-dose 1 cc immunizations) vials Preserved with thimerosal 1:10,000

Heparin Sodium U.S.P. (See New and Nonofficial Remedies 1952, p 208)

Walker Laboratories, Inc., Mount Vernon, N Y

Solution Heparin Sodium 10 cc vials A solution containing 1,000 U.S.P. units (approximately 10 mg) of heparin sodium in each cubic centimeter Preserved with 0.5% chlorobutanol

Solution Heparin Sodium 10 cc vials A solution containing 5,000 U.S.P. units (approximately 50 mg) of heparin sodium in each cubic centimeter Preserved with 0.45% phenol

Isoniazid (See THE JOURNAL, Feb 28, 1953, p 740)

The Parry Corporation, New York

Tablets Isoniazid 50 and 100 mg

Mephensin (See New and Nonofficial Remedies 1952, p 432)

The Bowman Bros Drug Company, Canton, Ohio

Tablets Mephensin 0.5 gm

S J Tutag & Company, Detroit

Elixir Mephison 118 cc., 473 cc., and 3.78 liter bottles An 18% alcohol, 30% propylene glycol solution containing 0.1 gm of mephensin in each cubic centimeter

Tablets Mephison 0.5 gm

Mercumatilin Sodium (See New and Nonofficial Remedies 1952, p 290)

Endo Products, Inc., Richmond Hill, N Y

Solution Cumertilin Sodium 10 cc vials An aqueous solution containing 0.132 gm of mercumatilin sodium (equivalent to 39 mg of mercury) and 11 mg of excess theophylline in each cubic centimeter Preserved with 0.18% methylparaben and 0.02% propylparaben

Penicillin for Inhalation (See New and Nonofficial Remedies 1952, p 121)

Schenley Laboratories Inc New York

Soluble Tablets Potassium Penicillin G 100,000 units

Penicillin for Oral or Sublingual Administration (See New and Nonofficial Remedies 1952, p 122)

Eli Lilly & Company, Indianapolis

Tablets Potassium Penicillin G (Buffered) 500,000 and 1,000,000 units Buffered with calcium carbonate

Premo Pharmaceutical Laboratories, Inc., South Hackensack, N J

Nebutabs Potassium Penicillin G 200,000 and 250,000 units

Progesterone U.S.P. (See New and Nonofficial Remedies 1952, p 348)

The Vitamine Company, Inc., New York

Solution Progesterone in Oil 1 cc ampuls A solution in sesame oil containing 5 mg or 10 mg of progesterone in each cubic centimeter 10 cc vials A solution in sesame oil containing 10 mg of progesterone in each cubic centimeter Both sizes preserved with 0.5% chlorobutanol

Solution Progesterone in Oil with Benzyl Alcohol 3% 10 cc vials A solution in sesame oil containing 25 mg. of progesterone in each cubic centimeter Preserved with 0.5% chlorobutanol

Pyridoxine Hydrochloride (See New and Nonofficial Remedies 1952, p 462)

The Vitamine Company, Inc., New York

Solution Pyridoxine Hydrochloride 10 cc vials A solution containing 50 mg of pyridoxine hydrochloride in each cubic centimeter Preserved with 0.5% chlorobutanol

Sulfisoxazole Diethanolamine (See THE JOURNAL, Feb 28, 1953 p 740)

Hoffmann-LaRoche, Inc., Nutley N J

Ophthalmic Ointment Gantrisin Diethanolamine 3.54 gm tubes An ointment containing 40 mg of sulfisoxazole in the form of the diethanolamine salt in each gram Preserved with 0.002% phenylmercuric nitrate

Testosterone Propionate-U.S.P. (See New and Nonofficial Remedies 1952 p 368)

The Vitamine Company, Inc., New York

Solution Testosterone Propionate in Oil 1 cc ampuls and 10 cc vials A solution in sesame oil containing 10 or 25 mg of testosterone in each cubic centimeter Preserved with 0.1% propylparaben

Solution Testosterone Propionate in Oil with Benzyl Alcohol 4% 1 cc ampuls and 10 cc vials A solution in sesame oil containing 50 mg of testosterone in each cubic centimeter

Tetanus Toxoid U.S.P. (See New and Nonofficial Remedies 1952, p 386)

U S Standard Products Company, Woodworth, Wis

Aquagen Tetanus Toxoid 1.5 cc (one 3-dose immunization), 7.5 cc (five 3-dose immunizations), and 22.5 cc (fifteen 3-dose immunizations) vials Preserved with thimerosal 1:10,000

Tetanus Toxoid, Alum Precipitated U.S.P. (See New and Nonofficial Remedies 1952, p 386)

U S Standard Products Company, Woodworth, Wis

Aquagen Tetanus Toxoid (Alum Precipitated) 1 cc (one 2-dose immunization) and 5 cc (five 2-dose immunizations) vials Preserved with thimerosal 1:10,000

Vitamin B₁-U.S.P. (See New and Nonofficial Remedies 1952, p 470)

William H Rorer, Inc., Philadelphia

Solution Crystalline Vitamin B₁ 1 cc ampuls A solution containing 30 µg of vitamin B₁ in each cubic centimeter Buffered with sodium acetate and acetic acid

Solution Crystalline Vitamin B₁ with Benzyl Alcohol 1.5% 10 cc vials A solution containing 30 or 50 µg of vitamin B₁ in each cubic centimeter Buffered with sodium acetate and acetic acid

INCIDENCE OF TUBERCULOSIS AMONG AMERICAN MEDICAL STUDENTS

For the past two decades various investigators have commented on the relative frequency with which tuberculosis occurs among medical students. In 1931 Hetherington and his associates¹ reported that medical students are especially subject to tuberculous infection, while in 1937 Dauer² asserted that the incidence of tuberculosis is greater among medical students than among persons of the same age and of a similar economic and social status. As a result of the Prophit survey, Daniels and his associates³ disclosed a tuberculosis rate three times greater among medical students than among comparable control groups.

Recently, with the assistance of the Association of American Medical Colleges, Abruzzi and Hummel⁴ made an inquiry into the incidence of tuberculosis among American medical students. Their survey covered approximately 42,000 students from 62 medical schools during the period between 1940 and 1950. The study revealed 557 cases of clinical tuberculosis, a case rate of 3.34 per 1,000 per year, as compared with similar groups of young adults in the general population, who had a case rate of 1.4 per 1,000 per year. Clinically active tuberculosis was defined as that which is proved bacteriologically or that which evidences a lesion on roentgenographic study not apparent on earlier films and is accompanied by concomitant symptoms, or both. All affected medical students fulfilled one or both of these criteria.

According to Abruzzi and Hummel, the factors that have been implicated as probably contributing to the high incidence of tuberculosis among students of medicine and nursing include deficiencies in aseptic technique and sanitary methods because of unconcern or ignorance, repeated contact with tuberculous patients, handling of cadavers of tuberculous patients, susceptibility and weakened natural resistance, and contact with undiagnosed

cases of tuberculosis. The authors were left with one inescapable conclusion, namely, that there is considerable exposure to tuberculosis among students of medicine and nursing and that liability to the development of clinical tuberculosis is much greater among those never before infected with the tubercle bacillus and then infected during medical training for the first time than among those who had been infected previously.

In addition to the use of sound, established procedures to help reduce the degree of exposure to tuberculosis, Ambruzzi and Hummel, while emphasizing that BCG should not be offered as a substitute for control measures that have already proved effective against tuberculosis in the United States, nevertheless are convinced of the harmlessness of BCG and believe that it offers at least partial protection, particularly to susceptible negative reactors subject to heavy tuberculous infection. Other limitations of BCG, it was pointed out, include the difficulty of knowing who can benefit from vaccination and who can be vaccinated without excessive adverse reactions. In general, more information is required as to what constitutes a successful vaccination and how long the acquired sensitivity may last. Of approximately 4,400 students vaccinated with BCG in the medical schools that employ it routinely as part of their tuberculosis control program, the survey showed that only 3 students contracted tuberculosis, none of whom became positive reactors, and that not one truly vaccinated student in the group of 4,400 with more than two to six years of exposure had contracted clinical tuberculosis.

The fact that adequate control programs, with or without the use of BCG, can prevent spread of tuberculosis among medical students has been amply demonstrated in recent years by a number of American medical schools. Before World War II, at least two or three medical students at the University of Illinois contracted clinical tuberculosis each year, during the past five years, a comprehensive control program, including the use of BCG, reduced the incidence to two cases. While there were seven cases of tuberculosis among students at Loyola University School of Medicine during the period 1940-1943, since the establishment of a student health service and a tuberculosis prevention program in 1943 there have been only two cases. The University of Kansas has had no cases of tuberculosis among its students since 1940, presumably in part because of a comprehensive control program. Ever since the University of Texas instituted a control program three years ago, only one case of tuberculosis was discovered among medical students, whereas five to seven cases annually occurred prior to that time.

Utilizing comprehensive control programs, Tufts College Medical School had no cases of clinical tuberculosis in the past five years, and the University of Rochester, which had a small number of cases, reduced the incidence to zero. At Tulane University 20 cases of clinical tuberculosis were discovered between 1940 and 1946, with but one case being revealed since then, an improvement traceable to control intensification. Nine cases of tuberculosis occurred among medical students at Washington

University of St. Louis between 1940 and 1947 and none since 1947, when a control program was intensified and BCG vaccination added. At the University of Pennsylvania 36 cases of tuberculosis were found between 1940 and 1948, but none have occurred since 1948, when prevention, including BCG vaccination, was emphasized. Eighteen cases of tuberculosis occurred at Woman's Medical College in Philadelphia between 1940 and 1942 and only three cases between 1943 and 1950, a period when a control program, which later included BCG, was introduced. After the institution of effective control programs, the University of Cincinnati College of Medicine has had no cases since 1947, while Cornell has had but one case since 1946. Finally, at the University of Minnesota, where the results have been most gratifying, there has been only one case in the past seven years, as compared to an annual tuberculosis incidence of 4% to 10% of the medical student body prior to the establishment of a comprehensive control program.

FATAL BICYCLE ACCIDENTS IN THE UNITED STATES

Bicycle accidents in the United States annually take about 600 lives, two-thirds of the fatal injuries occurring in the period from May to October, when the weather is most favorable for outdoor recreational activities. According to a recent study,¹ 9 out of 10 deaths occur among males, with boys 5 to 19 years of age constituting 70% of all the victims in both sexes. Interestingly enough, the concentration of deaths from bicycle accidents among females aged 10 to 14 years was found to be greater than among males, this indicates that young girls, like young boys, are frequently too venturesome. There was, however, an appreciable number of deaths even among older cyclists.

A number of factors contribute to the prevalence of bicycle accidents. Collision with a motor vehicle is by far the greatest hazard in bicycling, being responsible for at least four-fifths of fatalities. Other hazardous practices of bicyclists include "cutting in" in front of a motor vehicle, carrying an extra passenger on a bicycle, crossing from one lane to another without signaling, failure to exercise caution at street intersections, curves, or when coming out of a driveway or alley, riding on the wrong side of the street or too far from the curb, riding around or between automobiles, and riding bicycles in poor mechanical condition. Accidents other than those arising from collisions with motor vehicles were due mainly to falls from bicycles. About 2% of fatalities were among pedestrians run into by cyclists.

These facts make it clearly evident that most bicycle accidents can be prevented. Inasmuch as young children and teen-agers constitute the focal point of the problem, parents and school authorities have a twofold obligation—to make children aware of the hazards accompanying bicycling and to teach them safe habits of riding. Parental efforts should supplement those already exerted by the National Safety Council, the Bicycle Institute of America,

and other organizations concerned with reducing accidents. Finally, it is also important that drivers of automobiles and trucks be constantly made aware of the need for looking out for bicycles on streets and highways frequented by bicyclists.

INDUSTRIAL DERMATOLOGY

During the last quarter century the economic and social progress of the wage earning group of our national population has been highlighted by striking developments in improved medical care and by accumulated knowledge concerning the prevention, control, and management of the diseases peculiar to industry. The field of dermatology has participated in this progress.

At the present time approximately 60 million of our adult population comprise the working force. The heavy industries employ 25 million, of whom 15 million are in manufacturing and 21 million in service industries. It has been established that at any time a factory inspection is made in the United States an average of 1% of the workers can be found to have occupational dermatoses. These disorders comprise two-thirds of the occupational diseases for which compensation is paid, and yet the majority of them are not disabling and are therefore not recorded as compensation cases. The importance of these occupational dermatoses is evident.

An early field of investigation of industrial disease was in dermatology. The United States Public Health Service has maintained activity in dermatoses investigations for many years. In 1935 the Section on Dermatology and Syphilology of the American Medical Association set up a committee for the purpose of studying this problem and for accumulating, advancing, and disseminating information through educational channels and by other means. This project was accelerated and facilitated by the cooperation of a similar committee of the American Dermatological Association and the Section on Dermatoses Investigations of the Academy of Dermatology and Syphilology, by programs held at national and sectional meetings and later by symposiums conducted at annual meetings of the Academy of Dermatology and Syphilology.

Through recent action of the national dermatological organizations, the committees and groups concerned with this project have reorganized their functioning. A compact committee representative of the national dermatological groups has now been appointed to operate under the immediate direction of the American Medical Association's Council on Industrial Health and in close liaison with the previously designated organizations and all other groups interested in this field. It may be anticipated that the progress already made in advancing knowledge in the diagnosis and management of occupationally acquired skin diseases will be accelerated by this close affiliation with the home office of the American Medical Association.

¹ The Hazards in Bicycling. *Statist. Bull. Metrop. Life Insur. Co.*, 34:5 (April) 1953.

ORGANIZATION SECTION

FEDERAL MEDICAL LEGISLATION

Vocational Rehabilitation for the Blind

Congressman Rhodes (R, Ariz.) in H R 5562, joined by Congressman Williams (D, Miss) in H R 5610, has introduced a bill to amend the Vocational Rehabilitation Act at the request of the National Rehabilitation Association. This bill would include several important additions to this federal law, for example (1) it defines blindness for the first time, providing for certification by physicians skilled in diseases of the eye, (2) it permits the use of federal funds for the purchase of stocks of goods for business ventures for disabled persons generally, (3) federal funds could be expended to pay for the supervision of work of the disabled and to finance for their benefit training, demonstrations, research, and fellowships, and marketing arrangements would be facilitated, (4) it would allow federal payments to states whose programs of hospitalization exceed the 90 day limits, and (5) it authorizes those state agencies for the blind that operate separately from other state rehabilitation agencies to deal directly with the federal Office of Vocational Rehabilitation. The bill was referred to the Committee on Education and Labor.

Additional Vocational Rehabilitation Legislation

Congressman Rhodes (R, Ariz.) and Congressman Williams (D, Miss) have introduced H R 5563 and H R 5609, respectively, at the request of the National Rehabilitation Association. These bills would further amend the National Rehabilitation Act to authorize federal grants to the states for the establishment of rehabilitation centers to provide physical and occupational therapy, vocational or exploratory vocational training, testing, fitting, or training in use of prosthetic devices, and adjustment training and evaluation or control of special disabilities. The bills would also allow the use of federal funds to establish workshops in which remunerative employment could be provided to severely disabled persons who cannot be absorbed in the competitive labor market under the direction of a public or private nonprofit agency. In each case the federal share of the cost would range from one third to two-thirds, depending on the per capita wealth of the state. This bill was referred to Education and Labor Committee.

Establishing Service Connection for Tuberculosis

Congressman Radwan (R, N Y) has introduced H R 5636, which would establish a presumption of service connection for all types of tuberculosis becoming apparent within three years after discharge. Under the present law, a three years' presumption exists for pulmonary tuberculosis only, other types must become apparent in a shorter period of time. This was referred to the Veterans Affairs Committee. The bill was favorably reported without amendment the day after its introduction.

Factory Inspection by Food and Drug Agents

Chairman Wolverton (R, N J) of the Interstate and Foreign Commerce Committee has introduced H R 5740, written after hearings on all pending similar bills. This bill would permit inspection of factories, warehouses, and establishments in which food, drugs, devices, or cosmetics are manufactured, processed, packed, or held for interstate shipment after presentation of "appropriate credentials and a written notice." The inspecting agent is required to furnish the inspected establishment a copy of his findings and a receipt for any samples taken from the premises. The results of any analysis made of samples must later be furnished the establishment. This was referred to the Interstate and Foreign Commerce Committee.

The summary of federal legislation was prepared by the Washington Office of the American Medical Association and the summary of state legislation by the Bureau of Legal Medicine and Legislation.

STATE MEDICAL LEGISLATION

New Hampshire

Bills Enacted.—H J R 49 was approved May 26 1953. It provides for the creation of an interim commission to study and report on all phases of nursing with particular reference to the possibility of broadening the concept of nursing education. H 140 has become ch 126 of the laws of 1953. It provides that in civil action in which paternity is a relevant fact a court may order the mother, child and alleged father to submit to blood tests. If any party refuses to submit to such tests, the court may resolve the question of paternity against such party or enforce its order if the rights of others and the interests of justice so require. The law also provides that if the court finds that the conclusion of all the experts as disclosed upon the evidence based upon the blood tests, is that the alleged father is not the father of the child the question of paternity shall be resolved accordingly. If the experts disagree in their findings or conclusions the question shall be submitted upon all the evidence. If the experts conclude that the blood tests show the possibility of the alleged father's paternity admission of this evidence is within the discretion of the court depending upon the infrequency of the blood type. Finally the law permits the use of such tests in criminal cases under certain limitations. S 41 has become ch 172 of the laws of 1953. It amends the law relating to chiropractic by authorizing the revocation of a chiropractic license of any licensee who has been convicted of a felony. Previously the revocation was on the basis of conviction of a crime punishable by imprisonment in the state prison. S 67 has become ch 207 of the laws of 1953. In relation to voluntary patients under the control of the division on alcoholism the law provides that all records pertaining to voluntary patients shall be kept confidential and undivulged except that the executive director may release such records to hospitals, institutions and physicians whenever in his discretion such information may assist in further treatment of the voluntary patient.

Texas

Bills Enacted.—H 35 was approved May 19 1953. It amends the workmen's compensation act so as to permit injured employees to be treated by chiropractors and to permit such chiropractors to recover fees for the services which they perform. H 513 was approved May 28 1953. It makes it unlawful for any person to habitually use narcotic drugs, to be addicted to the use of narcotic drugs or to be under the influence of narcotic drugs provided that nothing in the act shall be applicable to a person who has a medical need for narcotic drugs and who obtains the narcotic drugs required for such medical need in accordance with the laws of the state of Texas and of the United States. H 535 was approved June 5 1953. It amends the law by exempting from jury service all physicians engaged in actual practice. H 609 was approved June 9 1953. It provides for the licensing regulation, and inspection of convalescent homes, nursing homes and related institutions.

Vermont

Bills Enacted.—H 311, was approved June 3 1953. It provides for the granting of nursing scholarships to persons enrolled or desiring to enroll in a school of nursing in the state for a three year course. H 321 was approved April 22 1953. It amends the law relating to the inspection of certain institutions by adding boarding homes to the list of institutions required to be inspected and licensed. H 332 was approved May 20 1953. It amends the law relating to the licensing of hospitals by exempting from the licensing provisions hospitals conducted, maintained or operated by the United States government, the state of Vermont or a duly authorized agency thereof. H 422 was approved May 27 1953. It amends the law relating to narcotic drugs by adding to the definition of such drug any other drugs to which the federal narcotic laws may now apply and any drug found by the commission after reasonable notice and opportunity for hearing to have an addiction forming or addiction-sustaining liability similar to morphine or cocaine.

MEDICAL ARTICLES IN LAY JOURNALS

The July issues of two national magazines contain articles that give the general public sound, accurately reported solutions to two often asked questions regarding medical care. "How Much Should Your Doctor Charge?" by Howard Whitman appears in the July *Woman's Home Companion*. In this article, Mr. Whitman reports on what medical societies and individual physicians all over the country are doing to take the mystery out of charges for a doctor's services. "How to Choose Your Doctor," by Irwin Ross, is in *Pageant* magazine. This article clearly outlines the steps that should be taken in selecting a family physician. It will be especially helpful to families moving into a new community.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit, in spite of cramped quarters and difficult access, was visited by most of the 48,000 persons attending the meeting. There were 260 exhibits selected from more than 500 applications for space, resulting in material of high caliber and great teaching value. The medical profession is indebted to the several hundred physicians, scientists, and technicians who spent long weary hours throughout the week demonstrating their exhibits and answering questions. From the standpoint of teaching value, the Scientific Exhibit this year can be considered one of the most instructive that has ever been presented.

Three special exhibits were immensely popular. The committee in charge of the Special Exhibit on Fractures, consisting of Gordon M. Morrison, M.D., Boston, Chairman, Ralph G. Carothers, M.D., Cincinnati, and Herbert Virgin Jr., M.D., Miami, Fla., initiated a somewhat different method of presentation in addition to the plaster demonstrations. As in the past, a fine group of demonstrators carried on throughout the week.

The Special Exhibit on Fresh Pathology, under the guidance of Frank B. Queen, M.D., Portland, Ore., and Milton Helpern, M.D., New York, attracted large crowds continuously. Demonstrations were conducted by an outstanding group of pathologists from over the country as well as from New York.

The Special Exhibit on Artificial Respiration, with Archer S. Gordon, M.D., Chicago, as chairman, was shown for the third time with the assistance of the New York Police Department, the American Red Cross, and the Council on Physical Medicine and Rehabilitation. A competent group of demonstrators was constantly on duty.

The Sections of the Scientific Assembly presented groups of exhibits dealing with their respective specialties. A representative to the Scientific Exhibit was elected by each Section to advise and assist in the procurement of exhibits. Awards consisted of medals, certificates of merit, and honorable mention.

The Section on Anesthesiology had eight exhibits, of which two received awards. Scott M. Smith, M.D., Salt Lake City, was the section representative.

The Section on Dermatology and Syphilology presented 10 exhibits. Three awards were made to the Section, one of which was a silver medal. James R. Webster, M.D., Chicago, was the section representative.

The Section on Diseases of the Chest, had eight exhibits, of which two received awards. The section representative was Edwin R. Levine, M.D., Chicago.

The Section on Experimental Medicine and Therapeutics had a group of 19 exhibits. There were three awards. Joseph F. Ross, M.D., Boston, was the section representative.

The Section on Gastro-Enterology and Proctology presented 16 exhibits, one of which received an award. The section representatives were J. P. Nesselrod, M.D., Evanston, Ill., and William H. Dearing Jr., M.D., Rochester, Minn.

The Section on General Practice had 14 exhibits. Two awards were given. Charles E. McArthur, M.D., Olympia, Wash., was the section representative.

The Section on Internal Medicine presented 22 exhibits. There were four awards, one of which was a gold medal and one a silver medal. The section representative was Wesley W. Spink, M.D., Minneapolis.

The Section on Laryngology, Otolaryngology and Rhinology had a group of eight exhibits, one of which received an award. The section representative was Francis W. Davison, M.D., Danville, Pa.

The Section on Military Medicine presented 13 exhibits from the Air Force, the Army, the Navy, and the Armed

Forces Institute of Pathology. The section representative was Capt. Robert V. Schultz (MC), U. S. N., Washington, D. C. Two awards were given.

The Section on Nervous and Mental Diseases had 10 exhibits, with two awards. G. Wilse Robinson Jr., M.D., Kansas City, Mo., was the section representative.

The Section on Obstetrics and Gynecology had a group of 15 exhibits. There were two awards. Frederick H. Falls, M.D., Chicago, was the section representative.

The Section on Ophthalmology had five exhibits, two of which received awards. The section exhibit committee was as follows: Wm. F. Hughes Jr., M.D., Chicago, Chairman, Walter H. Fink, M.D., Minneapolis, and Donald J. Lyle, M.D., Cincinnati.

The Section on Orthopedic Surgery had a group of 11 exhibits, of which 2 received awards. The section representative was J. Vernon Luck, M.D., Los Angeles.

The Section on Pathology and Physiology presented 14 exhibits, with 2 awards. In addition, the section sponsored the Special Exhibit on Fresh Pathology. Frank B. Queen, M.D., Portland, Ore., was the section representative.

The Section on Pediatrics had 15 exhibits, including an exhibit symposium on the prevention of childhood accidents. There were two awards. The section representative was F. Thomas Mitchell, M.D., Memphis, Tenn.

The Section on Physical Medicine and Rehabilitation presented a group of eight exhibits. There were two awards. Arthur L. Watkins, M.D., Boston, was the section representative.

The Section on Preventive and Industrial Medicine and Public Health had 10 exhibits, of which one received a bronze medal. Paul A. Davis, M.D., Akron, Ohio, was the section representative.

The Section on Radiology had 11 exhibits, with 2 awards. Richard H. Chamberlain, M.D., Philadelphia, was the section representative.

The Section on Surgery, General and Abdominal, presented a group of 23 exhibits. There were four awards, of which one was a bronze medal. The section representative was John H. Mulholland, M.D., Dobbs Ferry, N. Y.

The Section on Urology had seven exhibits, with two awards. Each day there was a general discussion of all urologic exhibits in the exhibit area. The Section exhibit committee consisted of Roger W. Barnes, M.D., Los Angeles, chairman, George H. Ewell, M.D., Madison, Wis., and Norris J. Heckel, M.D., Chicago.

There were 10 exhibits in the miscellaneous group, of which one received an award consisting of a gold medal.

Motion pictures, which usually are shown in an area adjacent to the Scientific Exhibit, were presented this year in the Baltimore Hotel. The average attendance throughout the week was 240. The program, which was arranged by the Committee on Medical Motion Pictures, included 29 films, with a discussion by the author in many instances. The three most popular films, from the standpoint of attendance, were as follows: The Brodie Craniopagus Twins, by Oscar Sugar, M.D., Herbert J. Grossman, M.D., and Paul W. Greeley, M.D., University of Illinois College of Medicine, Chicago; Primary Hyperparathyroidism, by Joel W. Baker, M.D., and Randolph P. Pillow, M.D., the Mason Clinic, Seattle, and Intra Articular Injections of Hydrocortisone, by William B. Rawls, M.D., New York.

The Committee on Awards for the Scientific Exhibit worked hard and faithfully, studying the exhibits during the day and holding sessions far into the night. The complete report of the Committee is as follows:

REPORT OF COMMITTEE ON AWARDS

MEDAL AWARDS

Hektoen Medal—The Hektoen Medal is presented for exhibits of original investigation, which are judged on the basis of originality and excellence of presentation. Three awards are made consisting of gold, silver, and bronze medals.

The **GOLD MEDAL** to Oscar V. Batson, University of Pennsylvania, the Graduate School of Medicine, Philadelphia, for the exhibit on the anatomy of veins.

The **SILVER MEDAL** to C. M. Pomerat, C. George Lefebvre, and McDonald Smith, University of Texas Medical Branch, Galveston, Texas, for the exhibit on tissue cultures in the service of clinical medicine.

The **BRONZE MEDAL** to F. D. Dodrill, Robert A. Gerisch, Edward Hull, and Aran S. Johnson, Harper Hospital, Detroit, for the exhibit on exposure of the pulmonary and mitral valves in living patients with the aid of the mechanical heart.

Billings Medal—The Billings Medal is presented for exhibits which do not exemplify purely experimental studies but are judged on the basis of excellence of correlating facts and excellence of presentation. Three awards are made, consisting of gold, silver, and bronze medals.

The **GOLD MEDAL** to J. Scott Butterworth, Charles A. Poinexter, and C. E. Peterson, New York University Post-Graduate Medical School, and the American Heart Association, New York, for the exhibit on the cardiac silhouette.

The **SILVER MEDAL** to T. J. Dry, R. L. Parker, J. E. Edwards, J. W. Kirklin, R. D. Pruitt, G. W. Daugherty, C. H. Schleisley, A. J. Bruwer, R. G. Tompkins, and A. H. Bulbulian, Mayo Clinic, Rochester, Minn., for the exhibit on diseases of the mitral valve—diagnosis and surgical treatment.

The **BRONZE MEDAL** to Werner Henle, Gertrude Henle, M. Michael Sigel, T. F. McNair Scott, and Klaus Hummeler, the Children's Hospital of Philadelphia, and the University of Pennsylvania School of Medicine, Philadelphia, for the exhibit on the virus diagnostic laboratory.

SECTION AWARDS

Certificates of Merit and Honorable Mention are awarded to the following exhibits in each Section.

Section on Anesthesiology—Certificate of Merit to Robert E. Clark, Louis R. Orkin, and E. A. Rovenstine, New York University Post-Graduate Medical School, New York, for the exhibit on body temperature during anesthesia.

Honorable Mention to Meyer Saklad, Elihu Saklad, and John F. Rockett Jr., Rhode Island Hospital, Providence, R. I., for the exhibit on pressure breathing.

Section on Dermatology and Syphilology—Certificate of Merit to F. Ronchese, B. S. Walker, and R. M. Young, Boston University, Boston, and Rhode Island Hospital, Providence, R. I., for the exhibit on the fluorescence of epidermoid carcinoma under the Wood Light.

Honorable Mention to Theodore Cornbleet and Hubert Catchpole, University of Illinois College of Medicine, Chicago, for the exhibit on keloids treated with hyaluronidase.

Section on Diseases of the Chest—Certificate of Merit to Brian A. Cookson, Daniel F. Downing, Houck E. Bolton, William Likoff, William L. Jamison, Russell W. Weller, and Charles P. Bailey, Hahnemann Medical College and Hospital, Philadelphia, for the exhibit on the role of hypothermia in cardiac surgery.

Honorable Mention to Oscar Auerbach, Harry L. Katz, and Maurice J. Small, Veterans Administration Hospital, East Orange, N. J., and Brooklyn, for the exhibit on effect of streptomycin on the bronchocavitary junction and its relation to cavity healing.

Section on Experimental Medicine and Therapeutics—Certificate of Merit to William Dameshek and Mario Stefanini, New England Center Hospital, Boston, for the exhibit on the blood platelets and idiopathic thrombocytopenic purpura.

Certificate of Merit to Eric T. Yuhl and Lloyd A. Sturtevant, Veterans Administration Center, and School of Medicine, University of California at Los Angeles, Los Angeles, for the exhibit on the use of radioactive isotopes in the various disorders of the liver and biliary tract.

Honorable Mention to Kurt Lange, Lawrence B. Slobody, Frank Craig, Ruth Strang, and Jacob Oberman, New York Medical College, New York, for the exhibit on serum complement levels in glomerulonephritis and the nephrotic syndrome.

Section on Gastroenterology and Proctology—Certificate of Merit to Julian A. Sterling and Ralph Goldsmith, Philadelphia, for the exhibit on newer concepts concerning the common bile ducts.

Section on General Practice—Certificate of Merit to Robert F. Dickey, Thomas A. Hepler, and James A. Collins Jr., Geisinger Memorial Hospital and the Foss Clinic, Danville, Pa., for the exhibit on dermatological manifestations of internal diseases.

Honorable Mention to Jacob J. Silverman and Harold B. Trachtenberg, Staten Island Hospital, Staten Island and New York, for the exhibit on hazards of mercurial diuretics.

Section on Internal Medicine—Certificate of Merit to Elmer C. Bartels, the Lahey Clinic, Boston, for the exhibit on clinical features of gout and its therapy.

Honorable Mention to Harry Mandelbaum and Robert A. Mandelbaum, Jewish Hospital of Brooklyn and Jewish Sanitarium and Hospital for Chronic Diseases, Brooklyn, for the exhibit on clinical ballistocardiography.

Section on Laryngology, Otology and Rhinology—Certificate of Merit to John E. Bordley, William G. Hardy, and Miriam D. Pauls, Johns Hopkins Hospital, Baltimore, for the exhibit on impaired hearing in the preschool child.

Section on Military Medicine—Certificate of Merit to Capt. E. R. Hering (MC), U.S.N., Lieut. Commander F. J. Lewis Jr. (MSC), U.S.N., and Lieut. C. M. Smythe (MC), U.S.N., Bureau of Medicine and Surgery, Navy Department, Washington, D. C., for the exhibit on amphibious and field medicine.

Honorable Mention to Lieut. (j.g.) E. H. Lanphier (MC), U.S.N., Bureau of Medicine and Surgery, Navy Department, Washington, D. C., for the exhibit on medicine and research in diving.

Section on Nervous and Mental Diseases—Certificate of Merit to Kermit E. Osserman and Lawrence I. Kaplan, Mount Sinai Hospital, New York, for the exhibit on myasthenia gravis management and diagnosis with edrophonium chloride (Tensilon).

Honorable Mention to Robert S. Schwab, John A. Abbott, William H. Timberlake, and Elsie Henson, Harvard Medical School and Massachusetts General Hospital, Boston, for the exhibit on control of side-effects of anticonvulsant drugs.

Section on Obstetrics and Gynecology—Certificate of Merit to C. Paul Hodgkinson, Howard P. Doub, and William Boucher, Henry Ford Hospital, Detroit, for the exhibit on urethrovaginal relationships in female urinary stress incontinence metallic bead chain technique.

Honorable Mention to Walter W. Williams, Springfield, Mass., and Melvin R. Cohen, Chicago, for the exhibit on diagnostic survey of the infertile couple.

Section on Ophthalmology—Certificate of Merit to Alson E. Braley, Howard Webster, and Lee Allen, University Hospitals, Iowa City, Iowa, for the exhibit on ocular prosthetics—solutions of several common fitting problems.

Honorable Mention to A. Ray Irvine Jr. and Zoltan Yuhasz, Estelle Doheny Eye Foundation, Los Angeles, for the exhibit on pigmented tumors of external eye and adnexa.

Section on Orthopedic Surgery—Certificate of Merit to C. S. MacCarty, J. M. Waugh, M. B. Coventry, and D. C. Dahlin, Mayo Clinic, Rochester, Minn., for the exhibit on surgical management of sacral chordomas and allied tumors.

Honorable Mention to Dan Baker, Arthur B King, and Willard Dotter, Guthrie Clinic, Sayre, Pa, for the exhibit on the treatment of spondylolisthesis with and without vertebral displacement

Section on Pathology and Physiology—Certificate of Merit to Hans Elias, John E Pauly, and Hans Popper, Chicago Medical School and Hektoen Institute for Medical Research and Cook County Hospital, Chicago, for the exhibit on architecture of the adrenal cortex

Honorable Mention to Clarence C Little, Margaret Dickie, M N Runner, and John L. Fuller, Roscoe B Jackson Memorial Laboratory, Bar Harbor, Maine, for the exhibit on studies in endocrine balance

Section on Pediatrics—Certificate of Merit to Orvar Swenson, Marshall Kreidberg and Carroll Berman, the Boston Floating Hospital for Infants and Children, Boston, for the exhibit on diseases related to pelvic parasymphathetic system—Hirschsprung's disease, megalobladder, and megaloureters

Honorable Mention to Charles W Lester and Walter A Wichern Jr, New York, for the exhibit on congenital and developmental deformities of the chest

Section on Physical Medicine and Rehabilitation—Certificate of Merit to Donald A Covalt and Irving S Cooper, Institute of Physical Medicine and Rehabilitation, New York University Bellevue Medical Center, New York, for the exhibit on early treatment of patients with spinal cord injury

Honorable Mention to Lawrence Linck and Jayne Shover, National Society for Crippled Children and Adults, Chicago, for the exhibit on sheltered employment

Section on Radiology—Certificate of Merit to Fay A LeFevre, Victor G DeWolfe, Alfred W Humphries, Eugene F Poutasse, and J C Root, Cleveland Clinic, Cleveland, for the exhibit on diagnosis of aorta iliac artery occlusion

Honorable Mention to Melvin M Figley, University Hospital, Ann Arbor, Mich, for the exhibit on accessory roentgen signs of coarctation of the aorta

Section on Surgery General and Abdominal—Certificate of Merit to John E Healey Jr and Paul C Schroy, Daniel Baugh Institute of Anatomy Jefferson Medical College, Philadelphia, for the exhibit on intrahepatic distribution of the bile ducts and hepatic arteries

Certificate of Merit to O T Clagett, E A Hines, H B Burchell, D G Pugh and E H Wood, Mayo Clinic, Rochester, Minn, for the exhibit on coarctation of the aorta—diagnosis and surgical treatment

Honorable Mention to John L Madden, John M Loré, Frank P Gerold and Jacob M Ravid, St Clare's Hospital, New York for the exhibit on pathogenesis of ascites in cirrhosis of the liver

Section on Urology—Certificate of Merit to Donald F McDonald, University of Washington School of Medicine, Seattle, for the exhibit on the role of the urine in vesical neoplasm

Honorable Mention to John K Lattimer, Louis L Spivak, and Frank J Lovelock, Veterans Administration Hospital, Bronx, N Y, for the exhibit on chemotherapy of genito urinary tuberculosis

Subsidized Exhibits—The Committee on Awards commends highly the Special Exhibits on Fractures, Fresh Pathology and Artificial Respiration, which are sponsored by the Board of Trustees of the American Medical Association

Comments—The Committee on Awards wishes to express its appreciation to all of the physicians who have so arduously performed their tasks in making this Scientific Exhibit unsurpassed in its quality

Respectfully submitted,

Committee on Awards

WILLIAM B CONDON, M D, Denver, Chairman
S W DONALDSON, M D Ann Arbor Mich

MINUTES OF THE SCIENTIFIC SECTIONS

SECTION ON ANESTHESIOLOGY

TUESDAY, JUNE 2—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr Rolland J Whitacre, Cleveland

A business meeting was held during which Dr John S Lundy, secretary, gave a report of the activities of the American Board of Anesthesiology, and Dr Henry S Ruth reported to the Section as its representative to the House of Delegates. Opportunity was given for the presentation of resolutions that anyone wished introduced in the House of Delegates.

Dr John W Pender, Rochester, Minn, read a paper on "Endotracheal Anesthesia in Children for Tonsillectomy and Adenoidectomy and for Other Surgical Procedures of Longer Duration." This paper was discussed by Drs Samuel L Lieberman, Buffalo, A H Kornblau, Jamaica, N Y, Robert M Smith, Boston, and John S Lundy, Rochester, Minn.

Dr E M Papper, New York, read a paper on "Renal Function During Anesthesia and Operation," which was discussed by Drs Urban H Eversole, Boston, Clarence L P Hebert, Staten Island, N Y, and Henry K Beecher, Boston.

Drs Robert E Clark, Louis R Orkin, and E A Rovenstine, New York, presented a paper on "Studies on Body Temperature in Anesthetized Man," which was discussed by Drs Meyer Saklad, Providence, R I, and Henry K Beecher and Robert M Smith, Boston.

Drs Walter H Mannheimer, John Adriani, and Philip Pizzolato, New Orleans, presented a paper on "Histological Changes in Nerve and Soft Tissues After Injection of Various Local Anesthetic Substances." This paper was discussed by Drs Daniel C Moore, Seattle, Albert M Betcher, New York, Francis F Foldes, Pittsburgh, and William K Nowill, Durham, N C.

Dr Lloyd H Mousel, Seattle, read a paper on "Cerebral Edema and Its Relationship to Barbituric Acid Poisoning," which was discussed by Drs Raymond F Courtin, Worcester, Mass, Richard H Barrett, Hanover, N H, Donald E Hale, Cleveland, and Theodore R Robie, East Orange, N J.

Drs F Paul Ansbros, Francis S Latteri, and Albert E Blundell, Brooklyn, presented a paper on "Spinal Anesthesia Prolonged for Fourteen, Eleven, and Seven Days Respectively." This paper was discussed by Drs Max S Sadove, Oak Park, Ill, and Morris J Nicholson, Boston.

WEDNESDAY, JUNE 3—MORNING

The following officers were elected: chairman, Moses Krakow, New York; vice chairman, Bruce Anderson, Oakland, Calif; representative to Scientific Exhibit, Scott Smith, Salt Lake City; nominees to American Board of Anesthesiology, John Dillon, Pasadena, Calif, M C Peterson, Kansas City, Mo, and Morris J Nicholson, Boston.

Dr Francis F Foldes, Pittsburgh, presented the following report as representative of the Section to the Scandinavian Congress of Anesthesiologists and the Austrian Congress of Anesthesiologists:

It has been my privilege to represent the Section on Anesthesiology of the American Medical Association at the Second Scandinavian Congress of Anesthesiologists that was held in Stockholm on Aug 8 and 9 and the First Austrian Congress of Anesthesiologists held in Salzburg on Sept 5 and 6, 1952.

The Congress in Stockholm met at the Karolinska Hospital. It was well attended not only by anesthesiologists from Scandinavia but also those

from other European countries and a small but active delegation came from England and the United States. The main topic of the meeting was muscle relaxants. Several excellent papers were presented on the experimental and clinical aspects of the use of muscle relaxants by Scandinavian anesthesiologists. Dr Beecher of the Harvard Medical School and your representative also read a paper in this symposium. The level of the papers presented and the ensuing discussion was very high and reflected the rapid development of anesthesiology in the Scandinavian countries. The social part of the Congress was also well arranged and the various banquets and excursions were highly impressive.

The First Austrian Congress of Anesthesiology was significant not only because it was the first of its kind in Central Europe but also because it represented the first effort to organize the anesthesiologists of Austria, Germany, and Switzerland into a single group. In contrast to the Scandinavian countries, England, France, and Italy, where organized anesthesiology has existed for many years, the anesthesiologists of Central Europe are at the beginning of a steep and tortuous path. The average Central European surgeon is still to be convinced of the importance of scientific anesthesia and is unwilling to relinquish any of his prerogatives in connection with the management of surgical patients. With few exceptions, the Central European anesthesiologists have a lot to learn but what they lack in knowledge and experience they more than compensate for with their enthusiasm and will to learn. This Congress ran parallel with the annual meeting of the Austrian Medical Association. Its meetings were often better attended than those of the main section. Besides the Austrian, German, and Swiss anesthesiologists, some English, French, and Italian anesthesiologists also presented papers. Dr Cullen of Iowa City and your representative also gave papers. The Congress was organized around two main topics: (1) Anesthesia Problems in Open-Chest Surgery, and (2) Epidural Anesthesia. The beautiful medieval city of Salzburg and its lovely surroundings contributed in no small measure to the success of this very pleasant Congress.

After attending these two meetings as your representative, it is my belief that whenever possible, more of us should try to attend these meetings to talk and see, and to teach and learn.

Dr Harry W Bowman, Bethlehem, Pa, read a paper on "Clinical Evaluation of Dextran as a Plasma Volume Expander." This paper was discussed by Drs I S Ravdin, Philadelphia, Sam F Seeley, Washington, D C, and Frederick M Allen, New York.

Drs Margaret A Clark and Charles D Anderson, Oakland, Calif, presented a paper on "Postoperative Nausea and Vomiting," which was discussed by Drs Robert L Patterson, Pittsburgh, and B B Sankey, Cleveland.

Dr Rolland J Whitacre, Cleveland, delivered his Chairman's Address entitled "The Anesthesiologist's Responsibility to the Patient."

Drs John J Burns, Bernard B Broadie, and Philip A Lief, New York, presented a paper on "The Pharmacologic Basis for the Rational Use of Thiopental in Clinical Anesthesia," which was discussed by Dr Benjamin E Etsten, Boston.

Dr James E Eckenhoff, Philadelphia, and Dr Willy H Dam, Copenhagen, Denmark, presented a paper on "Therapy of Narcotic Poisoning With and Without Analgetics." This paper was discussed by Drs Robert W Lykins, Portsmouth, Va, Howard M Ausherman, Chattanooga, Tenn, and Francis F Foldes, Pittsburgh.

THURSDAY, JUNE 4—MORNING

Drs Bernard E Cappe, Jamaica, N Y, and Irving M Pallin, Brooklyn, presented a paper on "Recent Advances in Obstetrical Analgesics." This paper was discussed by Drs Allan A Gentling, Fort Worth, Texas, and Virginia Apgar, New York.

Drs L Jennings Hampton, New Haven, Conn, and David M Little Jr, Stamford, Conn, presented a paper on "Complications Associated with the Use of 'Controlled Hypotension' in Anesthesia," which was discussed by Drs Stevens J Martin, Hartford, Conn, Scott M Smith, Salt Lake City, and C Paul Boyan, New York.

Drs Randal J M Steven and Ralph M Tovell, Hartford, Conn., presented a paper on "Hexamethonium Salts as an Aid to the Orthopedic Surgeon" This paper was discussed by Drs Francis F Foldes, Pittsburgh, Roger W Ridley, Rochester, Minn., and Harvey C Slocum, Washington, D C

Drs Charles B Pittinger and Lucien E Morris, Iowa City, presented a paper on Placental Transmission of D Tubocurarine Chloride from Mother to Fetus," which was discussed by Drs Ralph T Knight, Minneapolis, Lloyd E Larrick, Cincinnati Virginia Apgar, New York, and Ernesto Frial, Santiago, Chile

Drs Hamilton S Davis and Henry E Kretchmer, Cleveland, and Roger Bryce-Smith, Oxford, England, presented a paper on "The Advantages and Complications of Tracheotomy" This paper was discussed by Drs J Earl Remlinger Jr, Evanston, Ill Alvan L Barach, New York, Kenneth C McCarthy, Toledo, Ohio, Philip Woodbridge, Greenfield, Mass., and Roger Bryce Smith, Oxford, England

Drs Barnett A Greene and Samuel Berkowitz, Brooklyn, presented a paper on 'Tobacco Bronchitis An Anesthesiologic Study,' which was discussed by Dr Alvan L Barach, New York

SECTION ON DERMATOLOGY AND SYPHILOLOGY

TUESDAY, JUNE 2—AFTERNOON

The meeting was called to order at 1 55 o'clock by the chairman, Dr John H Lamb, Oklahoma City

The Nominating committee presented the following nominations chairman, George M Lewis, New York, vice chairman Hamilton Montgomery, Rochester, Minn secretary, J Walter Wilson, Los Angeles, representative to Scientific Exhibit Samuel Bluefarb, Chicago, delegate, Robert R Kierland, Rochester, Minn, alternate delegate Winfred A Showman, Tulsa, Okla representative to American Board of Dermatology and Syphilology, Donald M Pillsbury, Philadelphia

Miss Janet Newkirk, New York, read the report of the representative to the American Board of Dermatology and Syphilology for Dr George M Lewis

Dr James R Webster, Chicago, gave the report of the representative to the Scientific Exhibit

Drs John G Trump Cambridge, Mass, and John L Fromer and Hugh F Hare, Boston, presented a paper on "Cathode Rays in the Treatment of Malignant Lymphomas of the Skin" This paper was discussed by Dr Dan J Kindel, Cincinnati

Dr Paul A OLeary, Rochester Minn, read a paper on "The Uses and Abuses of Corticoid Therapy in Dermatology"

Drs Ben A Newman and Fred F Feldman, Beverly Hills, Calif, presented a paper on "Adult Premenstrual Acne An Entity Suggesting Corpus Luteum Dysfunction" which was discussed by Drs Gerald M Frumess Denver and M B Sulzberger, New York

Drs Clarence S Livingood and Samchai Nilasena Galveston, Texas presented a paper on "The Local Treatment of Cutaneous Bacterial Infections with Erythromycin" This paper was discussed by Drs Donald M Pillsbury Philadelphia Harold B Levin Atlanta, Ga and Roy L Kile, Cincinnati

Drs Robert E Holsinger and John E Dalton Indianapolis, presented a paper on "Isonicotinyl Hydrazine in the Treatment

of Cutaneous Tuberculosis and Allied Conditions" This paper was discussed by Drs H H Sawicky, New Rochelle, N Y, Frank E Cormia, New York and John E Dalton, Indianapolis

Drs Harold N Cole Jr, Paul V Chivington Jr, Harold N Cole, and James R Driver, Cleveland presented a paper on 'Atabrine in the Treatment of Lupus Erythematosus' which was discussed by Dr J Lamar Callaway, Durham, N C

WEDNESDAY, JUNE 3—AFTERNOON

The following officers were elected chairman George M Lewis, New York, vice chairman, Hamilton Montgomery, Rochester, Minn, secretary, J Walter Wilson, Los Angeles representative to Scientific Exhibit, Samuel Bluefarb, Chicago, delegate, Robert R Kierland Rochester, Minn, alternate delegate, Winfred A Showman, Tulsa Okla

Dr John H Lamb, Oklahoma City, read his Chairman's Address entitled "The Role of the Dermatologist in the Care of Cutaneous Malignancy"

Dr Earl D Osborne, Buffalo, read a paper on "Evaluation of Methods Used in the Treatment of Cutaneous Malignancy with Special Reference to Electrothermic Methods"

Dr George C Andrews, New York read a paper on "The Place of Roentgen Radiation in the Treatment of Cutaneous Malignancy"

Drs C Ferd Lehmann and J Lewis Pipkin, San Antonio, presented a paper on "The Use of Radium in the Treatment of Cutaneous Malignancy"

Dr Eugene F Traub, New York read a paper on "The Diagnosis and Treatment of Carcinoma of the Eyelids"

Drs J B Howell, Dallas Texas, and J Murray Riddell, Fort Worth, Texas, presented a paper on "Carcinoma of the Forehead and Scalp"

The papers by Drs Osborne, Andrews Lehmann and Pipkin Traub and Howell and Riddell were discussed by Drs Howard Hailey Atlanta, Ga James R Driver, Cleveland, and Joseph J Eller, New York, and in closing by Drs Traub Pipkin Andrews, and Osborne

THURSDAY, JUNE 4—AFTERNOON

Drs Molleurus Couperus, Los Angeles and Rufus C Rucker, Chico, Calif, presented a paper on "The Histopathologic Diagnosis of Malignant Melanoma," which was discussed by Dr Samuel W Becker Jr, Washington, D C, and Dr Couperus

Dr C H McCuiston, Austin, Texas read a paper on "The Persistence of Untreated Hemangiomas from Infancy Into Adult Life" This paper was discussed by Dr Francesco Ronchese, Providence, R I, and Dr McCuiston

Drs Rees B Rees and James H Bennett San Francisco, presented a paper on "Swimming Pool Abrasion Granuloma" This paper was discussed by Drs D E H Cleveland, Vancouver B C, Canada, Norman N Epstein, San Francisco Adolph Rostenberg Jr, Chicago, Howard Hailey, Atlanta, Ga and Dr Rees

Dr Albert M Kligman, Philadelphia, read a paper on "The Biological Effects of Superficial Roentgen Rays on the Scalp with Special Reference to Epilation," which was discussed by Drs Paul Gross, New York, and Dr Kligman The prepared discussion of Dr George M Lewis, New York, was read by Dr Wiley M Sams, Miami, Fla

Drs M G Fredericks and Frederic T Becker, Duluth, Minn., presented a paper on "The Management of Dyshidrosis: An Analysis of Vesicular and Pustular Eruption of the Hands and Feet of the Dyshidrotic Type." This paper was discussed by Dr Julius Ginsberg, Chicago, and Dr Fredericks.

Dr Ervin H Epstein, Oakland, Calif., read a paper on "The Association of Muco-Cutaneous and Visceral Malignancies," which was discussed by Drs Anthony C Cipollaro and Sigismund Peller, New York, A J Reiches, St Louis, and Dr Epstein.

SECTION ON DISEASES OF THE CHEST

TUESDAY, JUNE 2—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr Joseph C Placak Sr, Cleveland.

An address was presented by the chairman, Dr Joseph C Placak Sr, Cleveland.

A paper entitled "Mediastinal Tumors: A Survey of Modern Concepts in Diagnosis and Management" by Drs J Winthrop Peabody Jr, Lawrence H Strug, and James D Rives, New Orleans, was presented by Dr Peabody.

A paper entitled "Clinical Observations in the Origins of Pulmonary Cysts, Bronchiectasis and Emphysema" was presented by Dr Edgar Mayer, New York.

Dr Andrew L Banyai, Milwaukee, served as moderator of the panel on "Diagnosis of Chest Diseases," in which Dr James S Edlin, New York, presented seven case histories. The panel discussers were Drs John S Bouslog, Denver, Jerome R Head, Chicago, and David M Spain, Valhalla, N Y.

WEDNESDAY, JUNE 3—AFTERNOON

The following officers were elected for one year terms: chairman, Dr Jay Arthur Myers, Minneapolis; vice chairman, Dr Andrew L Banyai, Milwaukee; delegate, Dr Hollis E Johnson, Nashville, Tenn.; alternate delegate, Dr Edward W Hayes, Monrovia, Calif.; ex officio officers: Drs J Winthrop Peabody, Washington, D C, and Joseph Placak Sr, Cleveland. The secretary, Dr John F Briggs, St Paul, continues in office.

Panel papers on the "Diagnosis and Treatment of Hypertension" were presented by Drs Irvine H Page, Cleveland, Robert W Wilkins, Boston, Keith S Grimson, Durham, N C, and S W Hoobler, Ann Arbor, Mich., with Dr Edgar V Allen, Rochester, Minn., acting as moderator.

A Symposium on Modern Trends in Chest Surgery, with Dr Alfred Goldman, Beverly Hills, Calif., acting as moderator, was presented, during which the following papers were given: "Surgical Management of Benign and Malignant Tumors of the Lung: Discovered in X-Ray Survey" by Dr Brian B Blades, Washington, D C; "Surgical Treatment of Bronchiectasis: Indications and Results" by Drs Richard H Overholt and Francis M Woods, Brookline, Mass.; "Modern Surgical Management of Mediastinal Infection and Tumors" by Dr Arthur S W Touroff, New York. General discussion from the floor followed.

THURSDAY, JUNE 4—AFTERNOON

Joint Meeting with Section on General Practice

During a panel on the "Diagnosis and Treatment of Cardiac Emergencies," with Dr Arthur M Master, New York, acting as moderator, the following papers were presented: "Treatment of Left Heart Failure, Particularly Pulmonary Edema" by Dr Clarence E De la Chapelle, New York; "The Treatment

of Coronary Occlusion Including Shock" by Dr Herrman L Blumgart, Boston; "The Treatment of Cardiac Arrhythmias" by Drs Myron Prinzmetal and S Rexford Kennamer, Beverly Hills, Calif.

During a panel on the "Diagnosis and Treatment of Surgical Emergencies of the Chest," with Dr Ivan D Baronofsky, Minneapolis, acting as moderator, the following papers were presented: "Thoracic Vascular Emergencies" by Dr Frank L A Gerbode, San Francisco; "Emergencies of the Lung and Esophagus" by Dr J Gordon Scannell, Boston; "Chest Wall Injuries" by Dr Donald L Paulson, Dallas, Texas. Discussion from the floor followed.

SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

TUESDAY, JUNE 2—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr Maurice H Seevers, Ann Arbor, Mich.

Opening the Symposium on Recent Advances in Nephritis, Dr Henry D Lauson, New York, read a paper entitled "Recent Advances in Some Aspects of Kidney Physiology." Dr John K. Clark, Philadelphia, discussed Dr Lauson's paper.

Dr William Goldring, New York, read a paper entitled "Clinical Application of Current Tests of Renal Function," which was discussed by Drs Arthur M Fishberg and David S Baldwin, New York.

Dr Hugh R Butt, secretary, read a paper by Dr Charles A Janeway, Boston, entitled "Acute Glomerulonephritis: Recent Concepts of Etiology and Pathogenesis." This paper was discussed by Drs Kurt Lange, New York, and David Seegal, Welfare Island, N Y.

A paper entitled "Recent Advances in the Treatment of Acute and Chronic Renal Insufficiency," was read by Dr A C Corcoran, Cleveland, and was discussed by Drs Ernest E. Muirhead, Dallas, Texas, and Herbert Chasis and Benjamin Jablons, New York.

A paper entitled "Recent Advances in the Management of the Nephrotic State" by Dr John A Luetscher, Quinim B Deming, Ben B Johnson, and Carolyn F Piel, San Francisco, was read by Dr Luetscher and was discussed by Drs Conrad M Riley, New York, and Guy W Daugherty, Rochester, Minn.

A paper entitled "The Outlook for the Nephritic Patient," was read by Dr Norman M Keith, Rochester, Minn., and was discussed by Dr Robert F Loeb, New York.

WEDNESDAY, JUNE 3—MORNING

The following officers were elected: chairman, Irvine H Page, Cleveland; vice chairman, Hugh R Butt, Rochester, Minn.; and secretary, George E Burch, New Orleans.

Dr Maurice H Seevers, Ann Arbor, Mich., read his Chairman's Address entitled "Perspective Versus Caprice in Evaluating Toxicity of Chemicals in Man."

Drs Martin M Fisher and N David Wilensky, Brooklyn, presented a paper entitled "Trypsin Intravenously in Peripheral Vascular and Thromboembolic Diseases." This paper was discussed by Drs Irving Innerfield, Nyack, N Y, and Irving S Wright and Alfred Schwarz, New York.

The Minot Lecture, "Subacute Bacterial Endocarditis: The Present Day Treatment," was presented by Dr Chester S. Keefer, Boston.

Dr Jerry Zaslow, Philadelphia, read a paper entitled 'The Rational Use of Chemotherapeutic and Antibiotic Agents in the Treatment of Biliary Tract Disease,' which was discussed by Drs Waltman Walters, Rochester, Minn, and I S Ravdin, Philadelphia

A paper by Drs Harry Shay, Chris J D Zarafonitis, Nathan J Smith, and Irving Woldow, Philadelphia, entitled 'Preliminary Results in the Treatment of Experimental and Clinical Leukemia with Triethylene Thio-Phosphoramidate (Thio Tepa),' was read by Dr Shay and was discussed by Drs James A Wolff, New York, and J Minott Stickney, Rochester Minn

THURSDAY, JUNE 4—MORNING

A joint meeting was held with the Section on Internal Medicine The proceedings are reported in the minutes of that Section

SECTION ON GASTROENTEROLOGY AND PROCTOLOGY

TUESDAY, JUNE 2—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr Louis E Moon, Omaha

A paper entitled 'The Surgical Management of Ulcerative Colitis,' by Drs Harry E Bacon and Howard D Trimpi, Philadelphia, was read by Dr Bacon and was discussed by Drs Rupert B Turnbull Jr., Cleveland, Garnet W Alt, Washington, D C, J Arnold Bargen, Rochester, Minn, Z T Bercovitz, New York, Donovan C Browne, New Orleans, and Walter L Palmer, Chicago, and, in closing, by Dr Trimpi

A paper entitled "The Problems of Gastric Ulcer Reviewed," by Drs M Frances H Smith, Russell S Boles Jr, and Sara M Jordan, Boston, was read by Dr Smith This paper was discussed by Drs Russell S Boles and Henry L Bockus, Philadelphia, and Frank H Lahey, Boston, and, in closing, by Dr Jordan

A paper entitled Vagotomy as a Prophylactic and Curative Procedure in Peptic Ulcer, was presented by Drs Waltman Walters, Donald P Chance, and Joseph Berkson, Rochester, Minn, and was discussed by Drs H Marvin Pollard, Ann Arbor, Mich, Lester R Dragstedt, Chicago, and Frank H Lahey, Boston, and, in closing, by Dr Walters

A paper entitled 'The Role of the Anticholinergic Drugs in the Treatment of Ulcer,' by Drs J M Ruffin, E C Texter Jr, D D Carter, and G J Baylin, Durham, N C, was read by Dr Ruffin and was discussed by Drs William C Boeck, Beverly Hills, Calif, and Walter L Palmer, Chicago, and, in closing, by Dr Ruffin

A paper entitled 'Peptic Esophagitis Clinical, Radiographic and Endoscopic Features' by Drs Asher Winkelstein Bernard S Wolf, Max L Som, and Richard H Marshak, New York, was read by Dr Winkelstein

A paper entitled 'Uncommon Benign Lesions of the Lower Esophagus and Cardia of the Stomach,' by Drs Ralph Adams, Brookline, Mass, and Sidney B Luria, Waterbury Conn, was read by Dr Adams These two papers were discussed by Drs Richard Schatzkin, Brookline Mass, Franz J Ingelfinger and Walter B Hoover, Boston, and, in closing, by Dr Winkelstein

WEDNESDAY, JUNE 3—MORNING

The following officers were elected chairman, Dr Donovan C Browne, New Orleans, vice chairman, Dr Harry E Bacon, Philadelphia, secretary, Dr Everett D Kiefer, Boston, repre-

sentatives to Scientific Exhibit, Drs William H Dearing Rochester, Minn, and J P Nesselrod, Evanston, Ill and representative to American Board of Proctology, Dr Louis E Moon, Omaha

Dr Guy L Kratzer, Allentown Pa read a paper entitled 'Recurrent Anal Fissure A Concept of Pathogenesis and Treatment,' which was discussed by Drs Paul J Fuzy, Youngstown, Ohio, and Henry C Schneider, Philadelphia, and, in closing, by Dr Kratzer

The chairman, Dr Louis E Moon, Omaha, read his address entitled 'Proctologic Help for the General Practitioner and the Diagnostician'

A paper entitled 'The Role of Antibiotics in the Management of Amebiasis,' by Drs G Gordon McHardy and William W Frye, New Orleans, was read by Dr McHardy and was discussed by Drs W A Sodeman and Donovan C Browne, New Orleans, and Louis Carp, New York, and, in closing, by Dr Frye

A paper entitled 'Long Term Results in Corticotropin Treated Ulcerative Colitis,' by Drs C Wilmer Wirts, Martin E Rehfuess, and Herbert A Yantes, Philadelphia, was read by Dr Wirts and was discussed by Drs Thomas E Machella, Philadelphia, and Thomas P Almy, New York, and, in closing, by Dr Wirts

Dr Mark M Marks, Kansas City, Mo, read his paper entitled 'Antibiotic Residues in the Treatment of Nonspecific Ulcerative Colitis' This paper was discussed by Drs Z T Bercovitz and Asher Winkelstein, New York, and, in closing, by Dr Marks

A paper entitled 'Cecostomy and Colostomy in Acute Colon Obstructions Experiences in Ninety Nine Cases' by Drs Frank J Rack and Kenneth W Clement, Cleveland Ohio, was read by Dr Rack and was discussed by Drs Howard D Trimpi, Philadelphia, and Leland S McKittrick, Brookline, Mass, and, in closing, by Dr Rack

THURSDAY, JUNE 4—MORNING

Joint Meeting with Section on Pathology and Physiology

Dr Neil W Swinton, Boston, read his paper entitled 'Polyps of the Colon and Rectum,' which was discussed by Drs Marie Ortmyer, Chicago, Jay M Garner, Winnetka, Ill, Robert A Scarborough, San Francisco, and, in closing, by Dr Swinton

A paper entitled 'Pathology of Regional Ileitis and Ulcerative Colitis,' by Drs Shields Warren and Sheldon C Sommers, Boston was read by Dr Warren and was discussed by Drs Bentley P Colcock, Boston, and Burrill B Crohn New York, and, in closing by Dr Warren

A paper entitled 'The Role of the Adrenal Steroids in the Pathogenesis of Peptic Ulcer,' by Drs Seymour J Gray, Colin G Ramsey, Robert W Reifenshtein, and John A Benson, Boston, was read by Dr Gray This paper was discussed by Drs Harry Shay, Philadelphia, David J Sandweiss Detroit, Morton I Grossman, Chicago, Asher Winkelstein, New York, and, in closing by Dr Gray

Dr Franklin Hollander, New York, read his paper entitled 'The Two-Component Mucous Barrier Its Role in Protecting the Gastrointestinal Mucosa Against Peptic Ulceration' This paper was discussed by Drs J Earl Thomas, Philadelphia, and, in closing, by Dr Hollander

A paper entitled 'Enterobius Vermicularis Granuloma of the Appendix Vermiformis,' by Drs John R Schenken, Omaha, Francis C Coleman, Des Moines, Iowa, and Emma

S Moss, New Orleans, was read by Dr Schenken Dr William J Eckerle, Rolling Hills, Calif, read his paper entitled 'The Management of Enterobiasis' These two papers were discussed by Drs Emma S Moss and G Gordon McHardy, New Orleans, and, in closing, by Dr Eckerle

A paper entitled 'The Oral Use of Hydrocortisone (Compound F) in the Treatment of Sprue,' by Drs David Adlersberg, Henry Colcher, and Chun I Wang New York, was read by Dr Adlersberg and was discussed by Dr Perry J Culver, Boston, and, in closing, by Dr Adlersberg

SECTION ON GENERAL PRACTICE

TUESDAY, JUNE 2—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman Dr Richard A Mills

Dr Richard A Mills, Fort Lauderdale, Fla, delivered the Chairman's Address entitled 'The Family Doctor and Heart Disease with Emphasis on Its Iatrogenic Aspects'

A Panel Conference and Symposium on Management and Mismanagement of the Failing Heart was conducted by Dr Harry Gold, New York, moderator

The participants included Drs Walter C Alvarez, Chicago, E Cowles Andrus, Baltimore, William Dock, Arthur C De Graff, Arthur M Fishberg, Walter Modell, and Irving S Wright, New York, and Henry A Schroeder, St Louis

WEDNESDAY, JUNE 3—AFTERNOON

The following officers were elected chairman, Frederic Ewens, Manhattan Beach, Calif, vice chairman, Lowry H McDaniel, Tyronza, Ark, representative to Scientific Exhibit Charles E McArthur, Olympia, Wash

Dr Paul A Davis, Akron, Ohio, submitted his report as the delegate of the section to the House of Delegates

The members voted to adopt the Wyeth Educational Foundation Fund program submitted by Dr Milton B Casebolt, Kansas City, Mo

Dr Goodrich C Schaffler, Portland, Ore read a paper entitled, "General Practice Aspects of Pediatric Gynecology, which was discussed by Dr Robert B Greenblatt, Augusta, Ga

Dr John J Bonica, Tacoma, Wash, read a paper entitled 'The Management of Cancer Pain' This paper was discussed by Dr Raymond W Houde, New York

Dr Walter J Reich, Chicago, read a paper entitled "Diagnosis and Management of Abnormal Uterine Bleeding"

Dr Paul S Williamson, Memphis, Tenn, read a paper entitled "Stress and Tension Enemies of the Future"

Dr Philip Thorek, Chicago, read a paper entitled 'The Esophagus and the General Practitioner, which was discussed by Dr S A Mackler, Chicago

A paper by Drs Evelynne G Knouf, South Pasadena, Calif, and Dr Albert G Bower, Pasadena, Calif, entitled 'A Successful Method of Treating Measles Encephalitis with Typhoid Vaccine,' was read by Dr Evelynne G Knouf

THURSDAY JUNE 4—AFTERNOON

A joint meeting was held with the Section on Diseases of the Chest The proceedings are reported in the minutes of that section

SECTION ON INTERNAL MEDICINE

TUESDAY JUNE 2—MORNING

The meeting was called to order at 9 o'clock by the chairman Dr Truman G Schnabel, Philadelphia

Drs Earl N Silber and Louis N Katz Chicago, presented a paper on, 'Coronary Dilators and Angina A Re appraisal,' which was discussed by Drs A Carlton Ernestene, Cleveland, and Joseph E F Riseman, Boston

Drs W A Jeffers, C C Wolferth, H A Zintel, J H Hafkenschiel Jr, A G Hills, and A M Sellers, Philadelphia, presented a paper on 'The Clinical Course of 82 Patients with Severe Hypertension Following Adrenal Resection and Sympathectomy' This paper was discussed by Drs William Dock, Brooklyn, and Frederick M Allen, New York

Dr Paul D White, Boston, presented "The Billings Lecture The Principles and Practice of Prognosis"

Drs Rulon W Rawson, J E Rall and J Robbins, New York, presented a paper on 'The Use and Misuse of Radioiodine,' which was discussed by Dr Robert H Williams, Seattle

Drs Carroll M Leevy, Myra R Zinke, Thomas J White, and Angelo M Gnassi, Jersey City, N J., presented a paper on 'Clinical Observations of the Fatty Liver' This paper was discussed by Drs Mary Ann Payne, New York, and Thomas C Chalmers, Cambridge, Mass

Drs Chris J McLoughlin and Lester M Petrie, Atlanta, Ga, presented a paper on 'Diagnostic Significance of Blood Sugar Findings' This paper was discussed by Drs Garfield G Duncan, Philadelphia, and Russell E Teague, Harrisburg, Pa

WEDNESDAY, JUNE 3—MORNING

The following officers were elected chairman, Herrman L Blumgart Boston vice chairman, Willis M Fowler, Iowa City, secretary, A Carlton Ernestene, Cleveland, representative to Scientific Exhibit, John S Lawrence Los Angeles, delegate, Charles T Stone Sr Galveston, Texas, alternate delegate, William D Stroud, Philadelphia

Drs Joseph Felsen and William Wolarsky, New York, presented a paper on 'Acute and Chronic Bacillary Dysentery' which was discussed by Drs Walter L Palmer, Chicago, and F S Cheever, Pittsburgh

Drs W D Sutliff and L L Burkett, Memphis, Tenn., presented a paper on 'Active Chronic Pulmonary Histoplasmosis, which was discussed by Drs Hollis E Johnson Nashville, Tenn., and David T Smith, Durham, N C

Dr Truman G Schnabel, Philadelphia, read his chairman's address entitled 'Some Reflections on the American Board of Internal Medicine'

Drs Richard S Gubner Brooklyn, E W Dennis, Rensselaer, N Y, Chester M Suter, Albany, N Y, and H E Ungerleider, New York, presented a paper on "Effect of a Monocaproyl Derivative of Diaminodiphenylsulfone (Equilite) in Experimental and Clinical Tuberculosis' This paper was discussed by Dr Benjamin Burbank, Brooklyn

Drs Robert F J Hilker, Carl E Billings, and Paul S Rhoads, Chicago presented a paper on 'The Clinical Use of 1 Hydrazinophthalazine and Hexamethonium in the Treatment of Hypertension, which was discussed by Drs Edward Meilman, Boston, and Irvine H Page, Cleveland

Drs Olof H Pearson, Charles D West, and Norman E Treves New York presented a paper on 'Evaluation of Endocrine Therapy for Advanced Breast Cancer,' which was discussed by Dr Albert Segaloff, New Orleans

THURSDAY, JUNE 4—MORNING

Joint Meeting with Section on Experimental Medicine and Therapeutics

Dr Arthur Selzer, San Francisco, read a paper on "Defects of the Cardiac Septa," which was discussed by Drs Robert E Gross, Boston, Charles P Bailey, Philadelphia, and Henry Swan, Denver

Dr Richard J Bing, Birmingham, Ala, read a paper on Pulmonary Stenosis, which was discussed by Dr Henry Bahnson, Baltimore

Dr C Sidney Burwell, Boston, read a paper on 'Ductus Arteriosus and Vascular Rings' This paper was discussed by Dr John C Jones, Los Angeles

Dr George C Griffith Pasadena Calif, read a paper on "Unusual Manifestations Influencing Surgery of Coarctation of the Aorta" which was discussed by Drs O T Clagett, Rochester, Minn and John C Jones, Los Angeles

Drs E Cowles Andrus, Alfred Blalock, and William R Milnor, Baltimore, presented a paper on Mitral Stenosis" This paper was discussed by Drs Robert P Glover, Philadelphia Dwight E Harken, Boston, and Charles P Bailey, Philadelphia

SECTION ON LARYNGOLOGY, OTOTOLOGY AND RHINOLOGY

TUESDAY, JUNE 2—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr Dean M Lierle Iowa City

Dr Francis W Davison, Danville, Pa., introduced the scientific exhibitors

Dr Lawrence R Boies, Minneapolis read a paper on "Management of Chronic Maxillary Disease

Dr Fred W Dixon, Cleveland, read a paper on "Management of Chronic Ethmoid and Sphenoid Sinusitis"

Dr Walter P Work, San Francisco, read a paper on 'The Frontal Sinuses in Relation to Trauma Initial and Subsequent Care'

These papers were discussed by Drs Walter E Heck, San Francisco, Gordon F Harkness Davenport, Iowa Dean M Lierle Iowa City, Fred Z Havens, Rochester Minn Abraham Goldner, Flushing, N Y, Oscar Rodin, Westfield, Mass, and Walter D Klesstadt, Fall River, Mass

Dr Hans Von Leden, Evanston, Ill, presented a motion picture, 'Commando Operation for Carcinoma of Head and Neck'

WEDNESDAY JUNE 3—AFTERNOON

The following officers were elected chairman, Sam H Sanders, Memphis, Tenn vice chairman, Alden H Miller, Los Angeles, secretary Hugh A R Kuhn, Hammond Ind, representative to Scientific Exhibit, Walter E Heck, San Francisco

Dr Gordon F Harkness presented his report from the House of Delegates

Dr Dean M Lierle, Iowa City, read his chairman's address entitled 'Surgical Treatment of Persistent Thyroglossal Ducts and Cysts'

Dr Stewart G Wolf, Oklahoma City, presented a paper on "Reaction in the Nasal Mucosae The Relation of Life Stress to Chronic Rhinitis and Sinus' Headache'

This paper was discussed by Drs Edmund P Fowler Jr, George E Daniels, Emil Glas, and Lester L Coleman, New York Walter B Hoover, Boston, and Abraham I Goldner, Flushing, N Y

Dr Joel J Pressman, Los Angeles, presented a paper on 'Cancer of the Larynx Laryngoplasty to Avoid Laryngectomy' which was discussed by Drs De Graaf Woodman, and John F Daly, New York, Joseph I Kemler, Baltimore, and Fred Z Havens, Rochester, Minn

Dr Philip E Meltzer, Boston, read a paper on "Technique on Removal of Adenoid Tissue of the Nasopharynx in Children" This paper was discussed by Drs Joseph L. Goldman, New York, and Ernest Reeves, Passaic, N J

THURSDAY, JUNE 4—AFTERNOON

Dr J W McLaurin, Baton Rouge, La, read a paper on Otitis Externa The Facts of the Matter," which was discussed by Drs Joseph L Goldman and Emil Glas, New York, and Louis J Goldstein, Bronx, N Y

Dr John Marquis Converse, New York, presented a paper on The Treatment of Traumatic Deformities of the Face," which was discussed by Drs V H Kazanjian, Boston, and Thomas William Stevenson and Martyn Kafka, New York

Dr J Brown Farrior, Tampa, Fla, read a paper on 'The Fenestration Operation Analyzed for the Nonfenestrating Otologist' This paper was discussed by Drs Clair M Kos, Iowa City, and Arthur L Juers, Miami, Fla

Dr Edmund Prince Fowler Sr, New York, read a paper on Otosclerosis in Identical Twins Factors in Onset, Exacerbation and Stabilization" This paper was discussed by Drs Franz Altmann and Abraham I Goldner, Flushing, N Y

SECTION ON MISCELLANEOUS TOPICS

Session on Allergy

WEDNESDAY, JUNE 3—AFTERNOON

The meeting was called to order at 2 o'clock by the co-chairman, Dr J Warrick Thomas, Richmond, Va

Dr Leon Unger, Chicago, read a paper on "The Use and Abuse of Cortisone and ACTH in Allergic Disease" This paper was discussed by Dr Louis Levin, Brooklyn

Dr Oscar Swineford Jr, Charlottesville, Va, read a paper on Classification of Asthma which was discussed by Drs Henry T Friedman and Ben C Eisenberg, Beverly Hills, Calif, Jack A Rudolph, Miami Beach, Fla, and S J Prigal, New York

Dr George L. Waldbott Detroit, read a paper on Non-infectious Pneumonitis in Incipient Asthma"

Dr Walters S Burrage, Boston, co-chairman presided over the remainder of the meeting

Drs Adolph Rostenberg Jr, and James R Webster, Chicago, presented a paper on 'Mechanism of Drug Reactions'

Dr Giles A Koelsche, Rochester, Minn, acting as moderator of a Panel Discussion, presented a case history which

was discussed by the members of the panel, Drs Walter S Burrage, Boston, Samuel M Feinberg, Chicago, Bret Ratner, New York, Harry L Rogers, Philadelphia, Bram Rose, Montreal, Canada, and J Warrick Thomas, Richmond, Va

Dr Henry T Friedman, Beverly Hills, Calif, discussed the panel presentation from the floor

SECTION ON MILITARY MEDICINE

WEDNESDAY, JUNE 3—AFTERNOON

The meeting was called to order at 2 o'clock, the chairman of the section, Dr Richard A Kern, presiding

The following officers were elected chairman, Major Gen Harry G Armstrong, Washington, D C, vice chairman, Dr I S Ravdin, Philadelphia, secretary, Col Charles L Leedham, Washington, D C

Dr Richard A Kern, Philadelphia, Pa, presented his Chairman's Address

A paper on "Helicopters in Peace and War" by Brig Gen M S White and Major Robert W Merkle, Langley Air Force Base, Va, was presented by Gen White, and was discussed by Brig Gen Alvin L Gorby Washington, D C

Dr Melvin A Casberg, Washington, D C, presented a paper on 'Office of the Assistant to the Secretary of Defense (Health and Medical)—Organizational and Functional Evolution'

Col William W Roe Jr, Washington, D C, presented a paper on 'Status of Physicians' Draft Present and Future'

Col Fratis L Duff, Washington, D C, presented a paper on 'Preventive Medicine Problems in Global Air Deployment,' which was discussed by Col Theodore C Bedwell Jr, Washington D C, and Lieut Col John Rizzolo, Gunter Air Force Base Ala

A paper on "Resuscitation of the Severely Injured Battle Casualties" by Capt John M Howard and Lieut Col William H Crosby Jr, Washington D C, was presented by Colonel Crosby, and was discussed by Dr Francis D Moore, Boston

A paper on "Advancements in Submarine Medicine" by Commander Gerald J Duffner and Commander Jack L Kinsey, New London, Conn, was presented by Commander Duffner, and was discussed by Commander H J Alvis, New London, Conn

THURSDAY, JUNE 4—AFTERNOON

Brig Gen Sam F Seeley, Washington D C, presented a paper on "Intra-Arterial Transfusion, which was discussed by Capt Robert B Brown, Bethesda, Md, and Lieut Frank Cole Spencer, Los Angeles

A paper on "Academic Freedom in Military Medical Research by Dr Howard T Karsner and Commander R A Phillips, Washington, D C, was presented by Commander Phillips, and was discussed by Drs Lowell T Coggeshall, Chicago, and Stanhope Bayne Jones, New York

Col Donald S Wenger, Washington, D C, presented a paper on 'Medical Aspects of Crash Injuries This paper was discussed by Col Ralph E Switzer, San Bernardino, Calif, and Lieut Col Robert A McCall, Washington, D C

A paper on "Observations of the Fundus Oculi During Blackout" by Lieut T D Duane, and Lieut Commander Edward L Beckman, Johnsville, Pa, was presented by Lieutenant Duane, and was discussed by Col Victor Burns, Randolph Field, Texas

SECTION ON NERVOUS AND MENTAL DISEASES

TUESDAY, JUNE 2—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr Francis M Forster, Washington, D C

A paper entitled 'The Common Whiplash Injuries of the Neck,' by Drs James R Gay, White Plains, N Y, and Kenneth H Abbott, Columbus, Ohio, was read by Dr Gay, and was discussed by Dr Byron P Stoolley, New York, and, in closing, Dr Gay

Dr J Rudolph Jaeger, Philadelphia, read a paper entitled 'Congenital Spinal Meningocele' This paper was discussed by Drs Edgar A Kahn, Ann Arbor, Mich, Clemens E Benda, Waverley, Mass, Harold C Voris, Chicago, and, in closing, Dr Jaeger

A paper entitled "Technical Suggestions for the General Surgeon in the Care of Suspected Middle Meningeal Hemorrhage Under Emergency Conditions," by Drs R B and A A Raney, Los Angeles, was read by Dr R B Raney, and was discussed by Drs Lester A Mount, New York, E S Gurdjian, Detroit, and, in closing, Dr Raney

Dr Frank H Mayfield, Cincinnati, Ohio, read a paper entitled 'The Role of the Cervical Roots in the Production of Pain in the Head and Face,' which was discussed by Dr E Jefferson Browder and A M Rabiner, Brooklyn, and, in closing, Dr Mayfield

A paper entitled "Complications Following Cerebral Angiography with Diodrast," by Drs Dogan Perese, William C Kite Jr, Arthur J Bedell, and Eldridge H Campbell, Albany, N Y, was read by Dr Campbell, and was discussed by Drs A Earl Walker, Baltimore, John P Gallagher, Washington, D C, and, in closing, Dr Campbell

Dr Francis C Grant, Philadelphia, read a paper entitled 'Review of Surgical Results in a Series of 1 800 Brain Tumors Followed for at Least Five Years' This paper was discussed by Drs Matthew T Moore, Philadelphia, Clarence S Greene, Washington, D C, and, in closing, Dr Grant

WEDNESDAY, JUNE 3—AFTERNOON

The following officers were elected chairman, Dr A Earl Walker, Baltimore, vice chairman, Dr Abe Hauser, Houston, Texas, secretary, Dr Karl O Von Hagen, Los Angeles, delegate, Dr Hans H Reese, Madison, Wis, alternate delegate, Dr Paul C Bucy, Chicago, representative to American Board of Neurosurgery, Dr Edgar F Fincher, Atlanta, Ga, representative to American Board of Psychiatry and Neurology, Dr George N Raines, Portsmouth, Va, representative to Scientific Exhibit, Dr G Wise Robinson, Kansas City, Mo

Dr Hans H Reese, Madison, Wis, reported as delegate to the House of Delegates On motion of Dr T R Robie, East Orange, N J, which was duly seconded it was voted unanimously that the section should be represented on the Council on Physical Medicine and Rehabilitation

On motion of Dr Charles Rupp Jr, Philadelphia, seconded by Drs Frank H Luton, Nashville, Tenn, and Roland P Mackay Chicago it was voted unanimously that the membership of the Committee on Mental Health should be more equally distributed among representatives of neurology, psychiatry, and neurosurgery

Dr Karl O Von Hagen, Los Angeles, secretary of the section, read the report on the American Board of Psychiatry and Neurology, which was adopted

Dr Von Hagen then read a report on the American Board of Neurosurgery which was approved

The chairman of the section, Dr Francis M Forster, Washington, D C, read his Chairman's Address entitled "The Development and Future of the Section on Nervous and Mental Diseases"

A paper entitled "Clinical Implications of Recent Studies of the Cerebral Circulation," by Drs Henry A Shenkin and Paul Novack, Philadelphia, was read by Dr Shenkin and was discussed by Drs Charles Rupp Jr and Michael Scott, Philadelphia, and, in closing, Dr Shenkin

A paper entitled 'The Social Psychological Therapy of Epilepsy,' by Drs William G Lennox and Charles H Markham, Boston, was read by Dr Lennox This paper was discussed by Dr H Houston Merritt New York

A paper entitled Cerebral Complications Associated with Pregnancy," by Drs Benjamin Boshes and Juanita G McBeath, Chicago, was read by Dr Boshes, and was discussed by Dr Theodore J C von Storch, New York, and, in closing Dr Boshes

A paper entitled "Antispasmodic Compound 08958 in the Treatment of Parkinsonism" by Drs Kenneth R Magee and Russell N DeJong, Ann Arbor, Mich, was read by Dr Magee This paper was discussed by Drs Lewis J Doshay, New York, Robert S Schwab, Boston, and, in closing Dr Magee

A paper entitled Observations on the Course and Management of Myasthenia Gravis by Drs David Grob and A McGehee Harvey, Baltimore, was read by Dr Grob and was discussed by Drs Roland P Mackay, Chicago, Henry R Viets Boston, N H Wooding, Halifax, Va, and, in closing, Dr Grob

THURSDAY, JUNE 4—AFTERNOON

Dr Sol Levy Medical Lake, Wash, read a paper entitled The Pharmacological Treatment of the Aged Hospitalized in an Institution for the Mentally Ill," which was discussed by Dr Hollis E Clow, White Plains, N Y, and, in closing, Dr Levy

A paper entitled The Distribution, Form, and Extent of Psychiatric Consultation Services in the United States,' by Drs Daniel Blain, Washington D C, and R Finley Gayle Jr, Richmond, Va, was read by Dr Blain, and was discussed by Drs Leo H Bartemeier, Detroit, C N Baganz, Lyons, N J, and, in closing Dr Blain

Dr Karl O Von Hagen Los Angeles, secretary of the section read a letter from Dr George Stevenson, Medical Director of the National Association for Mental Health, Inc with regard to medical education and licensure with respect to the development of psychiatric education in medical schools On motion of Dr Roland P Mackay, Chicago seconded by Dr James P Scanlon, Washington, D C, it was voted unanimously that the secretary be instructed to write a letter to Dr Stevenson thanking him for the informative communication and expressing the desire of the section to receive, preferably just before the next annual meeting any further information regarding activities in the field of mental health, such letter to be read on the program at that time when a majority of the psychiatrists will be present

Dr Forster announced the appointment of Dr Roland P Mackay, Chicago, to work together with Dr Forster and Dr Hans H Reese on a committee to canvass the question of fixed membership of the section and to report at the next meeting

Dr Daniel Blain Washington, D C., reported for the Committee on Licensure

Dr Blain then reported concerning a recent executive order by President Eisenhower concerning security requirements for government employees On motion of Dr Zigmond M Lebensohn, Washington, D C, seconded by Dr T R Robie, East Orange, N J, it was voted unanimously to endorse the resolution presented by Dr Blain

A paper entitled The Alleviation of Emotional Problems in Multiple Sclerosis by Group Psychotherapy, by Drs Robert H Barnes, Ewald W Busse, and Harold Dinken, Denver, was read by Dr Barnes, and was discussed by Drs Wilfred C Hulse and Benjamin Rosenbluth New York

A paper entitled Prognosis in Psychiatry The Results of Psychiatric Treatment," by Drs Kenneth E Appel, J Martin Myers Jr, and Albert E Scheffen, Philadelphia, was read by Dr Appel This paper was discussed by Drs Lothar B Kalinowsky and Noland D C Lewis, New York, Walter Freeman, Washington, D C, and, in closing, Dr Appel

Dr Hardin M Ritchey New Canaan, Conn, read a paper entitled Psychotherapeutic Reeducation, which was discussed by Drs George N Raines and Zigmond M Lebensohn Washington, D C, and, in closing, Dr Ritchey

A paper entitled 'Anxiety and Depressive States Treated with Isonicotinyl Hydrazide, by Drs Harry M Salzer and Max L Lurie, Cincinnati was read by Dr Lurie, and was discussed by Drs Francis J Braceland, Hartford, Conn Frank H Luton, Nashville Tenn, William Shapera, Philadelphia William J Turner, Huntington, N Y, and, in closing, Dr Lurie

SECTION ON OBSTETRICS AND GYNECOLOGY

TUESDAY, JUNE 2—MORNING

The meeting was called to order at 9 o'clock by the vice chairman, Dr R Gordon Douglas, New York

Dr Donald W deCarle, San Francisco, read a paper on Spinal Anesthesia in Cesarean Section A Critical Analysis of Some 1200 Cases with No Maternal Mortality' This paper was discussed by Drs Robert A Cosgrove, Jersey City, N J, Edward C Allen, Boston William F Finn, New York, J Kingsley MacDonald, Charlotte, N C, William Van Auken, Troy, N Y, and Donald W deCarle, San Francisco

Drs Samuel M Dodek, Joseph M Friedman, Peter A Soyster, and Harvey L Marcellus, Washington, D C, presented a paper on The Intrapartum Initiation of Lactation Control with a Single Dose of a Long Acting Androgen (Testosterone Cyclopentylpropionate) This paper was discussed by Drs Robert B Greenblatt, Augusta Ga, S Andrew Silverman, Newark, N J, Maxwell Roland, Forest Hills, N Y, Florence A Smith, Chicago, George Schaefer, Forest Hills N Y, and Samuel M Dodek, Washington, D C

Dr Ira I Kaplan, New York, read a paper on An Experience of 27 Years in the Therapeutic Administration of Low Voltage X-Rays to the Pituitary and Ovaries in the Treatment of Female Sterility,' which was discussed by Drs S

Leon Israel, Philadelphia, M N Runner, Bar Harbor, Maine, E L Spoehr, Detroit, Morris Gottlieb Atlantic City N J, Harold M Sesen, Lynn, Mass, and Ira I Kaplan, New York

Drs Catharine MacFarlane, Philadelphia, Margaret C Sturgis Wynnewood, Pa. and Faith S Fetterman, Philadelphia, presented a paper on "Periodic Examination of the Female Breasts and Pelvic Organs Report of a 15 Year Research on the Control of Cancer" This paper was discussed by Drs Gray H Twombly, New York, Dr Anna S K.

Daniels, New York, Charles S Stevenson, Detroit D G Benjamin, Cleveland, Elisabeth Larsson, Los Angeles, John E Burch, Joplin Mo, Paul W Pendell, French Cameroun, West Africa, Walter B Neubauer, Mt Vernon, N Y, M J Rose, Miami Beach, Fla, and Catherine MacFarlane, Philadelphia

Drs S J Glass and M L Lazarus, Beverly Hills, Calif, presented a paper on 'Improved Fertility and Prevention of Abortion After a Liver-Hormonal Regimen,' which was discussed by Drs Morton S Biskind Westport, Conn, Gordon Rosenblum, Los Angeles, Anna S K Daniels, New York, Maxwell Roland Forest Hills, N Y, John Rao, Kissimmee, Fla, and S J Glass, Beverly Hills, Calif

WEDNESDAY, JUNE 3—MORNING

The meeting was called to order at 9 o'clock by Dr Louis H Douglass, Baltimore, executive Committee Member

The following officers were elected chairman, Dr Bernard J Hanley, Los Angeles, vice chairman, Dr Frederick H Falls, Oak Park, Ill, secretary, Dr D Frank Kaltreider, Baltimore

Dr Edward T Tyler, Los Angeles, read a paper on "Physiological and Clinical Aspects of Conception," which was discussed by Dr A R Abarbanel, Los Angeles, Eric M Matsner, Beverly Hills, Calif, and Edward T Tyler, Los Angeles

Dr Edmund R Novak, Baltimore, read a paper on *Relationships of Endometrial Hyperplasia and Adenocarcinoma of the Fundus*, which was discussed by Drs James A Corscaden, New York, and Edmund R Novak, Baltimore

Dr C P Hodgkinson and R R Margulis, Detroit, presented a paper on *Defibrinogenation Syndrome of Obstetrics Etiology and Management*, which was discussed by Drs Charles L Schneider, Detroit, Edward Zaino, Levittown, N Y, William J Dieckmann, Chicago Charles O Evanson, Elmhurst, Ill, James E Morgan, Cleveland, and C P Hodgkinson, Detroit

Dr William S Kroger, Evanston, Ill, read a paper on 'Psychosomatic Aspects of Obstetrics and Gynecology' This paper was discussed by Drs A J Mandy, Baltimore, H Flanders Dunbar, New York Anna S K Daniels, New York, and William S Kroger, Evanston, Ill

Dr Raymond J Pieri, Syracuse, N Y, read a paper on "The Obstetrical Forceps Its Use and Abuse, which was discussed by Drs John F Fiorino, Everett, Wash, Newlin F Paxson, Philadelphia, and Raymond J Pieri, Syracuse, N Y

THURSDAY, JUNE 4—MORNING

The meeting was called to order at 9 o'clock by the vice chairman, Dr R Gordon Douglas, New York

Dr Arthur Weinberg, Far Rockaway, N Y, read a paper *Radiological Estimation of Pelvic Expansion*, which was discussed by Drs Alan F Guttmacher and Samuel Scadron, New York, and Arthur Weinberg, Far Rockaway, N Y

Drs Edward Tolstoi, William P Given and R Gordon Douglas New York, presented a paper *Management of the Pregnant Diabetic*, which was discussed by Drs Edward G Waters, Jersey City, N J, Frederick M Allen, New York, Irving Werner, Binghamton, N Y, Linton Snaith, Newcastle-on-Tyne, England, and Dr Tolstoi

Dr D Frank Kaltreider, Baltimore, read a paper "The Contracted Outlet," which was discussed by Drs Edward H Dennen, New York, Arthur Weinberg, Far Rockaway, N Y, and D Frank Kaltreider, Baltimore

Drs John R McCain, Atlanta, Ga, Clarence L Anderson, Lakeland, Fla, William M Lester, Atlanta, Ga, and Joseph W Pilkington, St Petersburg, Fla, presented a paper *Prolonged Labor A Clinical Evaluation* This paper was discussed by Drs Duncan E Reid, Boston, Louis M Hellman, New York, John P Gardiner, Toledo, Ohio, Morris Gottlieb, Atlantic City, N J, Arthur Weinberg, Far Rockaway, N Y, and John R McCain, Atlanta, Ga

Dr Elisabeth Larsson, Los Angeles, read a paper "Elective Appendectomies at the Time of Caesarean Sections," which was discussed by Drs Nicholson J Eastman, Baltimore, Frank O Wood and G Lawrence Austin Jr, Hartford, Conn, Bernard J Hanley, Los Angeles, Edward G Waters, Jersey City, N J, Anna S K Daniels, New York, Ernest F Purcell, Trenton, N J, and Elisabeth Larsson, Los Angeles

SECTION ON OPHTHALMOLOGY

TUESDAY JUNE 2—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr Francis H Adler, Philadelphia

Dr Adler read his Chairman's Address

Drs Peter C Kronfeld, Chicago, and Dohrmann K Pischel, San Francisco, presented a paper *The Scleral Resection Operation for Retinal Detachment An Evaluation of the Results*, which was discussed by Drs Charles L Schepens, Boston, and Derrick Vail, Chicago

Dr Angelos N Dellaporta, Buffalo, read a paper on "A Comparison of Scleral Resection and Scleral Folding in the Experimental Shortening of the Eye This paper was discussed by Drs Kenneth C Swan, Portland, Ore, A A Knapp, New York, Charles L Schepens, Boston, and Harvey E Thorpe, Pittsburgh

Drs Isadore J Eisenberg, Irving H Leopold, and David M Sklaroff, Philadelphia, presented a paper on "The Use of P³ Diagnostically in Ocular Pathology," which was discussed by Drs Edwin B Dunphy, Boston, and Murray A Last, New York

Dr David G Cogan, Boston, read a paper on "Ocular Dysmetria, Flutter-Like Oscillations of the Eyes, and Opsoclonus," which was discussed by Dr Frank B Walsh, Baltimore

Dr Daniel G Vaughan Jr, San Jose, Calif, read a paper on *Xerophthalmia* This paper was discussed by Drs Arthur M Yudkin, New Haven, Conn, Karl W Ascher, Cincinnati William J Holmes, Honolulu, and Frederick H Verhoeff, Boston

Drs Byron H Demorest and Benjamin Milder, St Louis, presented a paper on *Dacryocystography The Normal Lacrimal Tract*, which was discussed by Dr J Vernal Cassidy, South Bend, Ind

WEDNESDAY, JUNE 3—MORNING

The following officers were elected chairman, Dr Trygve Gundersen, Boston, vice chairman, Dr Dohrmann K Pischel, San Francisco secretary, Dr Harold G Scheie, Baltimore, delegate, Dr William L Benedict, Rochester, Minn, and representative to the Scientific Exhibit, Dr William F Hughes Jr, Chicago

The following committee appointments were made *American Committee on Optics and Visual Physiology (joint)* Dr Lawrence T Post reappointed, Committee on American

Board of Ophthalmology Dr John S McGavie, Committee on National Museum of Ophthalmic Pathology Dr Jonas S Friedenwald reappointed, Committee on Scientific Exhibit Dr William F Hughes Jr, chairman, and Dr Donald J Lyle and Dr Walter H Fink reappointed, Committee on Museum of Ophthalmic History Dr Burton Chance, chairman, Dr Hans Barkan reappointed, and Dr Frederick C Cordes appointed, Committee to National Conference on Medical Nomenclature (joint) Dr Conrad Berens reappointed, Committee on American Orthoptic Council (joint) Dr Hermann M Burian reappointed for three years, Committee on Industrial Ophthalmology (joint) Dr Albert D Ruedemann, chairman, Dr Hedwig S Kuhn and Dr Glenn Harrison, all reappointed Representatives of Section to American College of Surgeons for the term 1953-1956, Dr James N Greear Jr, Reno, Nev., Dr Harold H Joy, Syracuse, N Y., Dr Alston Callahan, Birmingham, Ala., and for the term 1954-1957, Dr M Hayward Post St Louis Dr C Dwight Townes, Louisville, Ky., Dr Ralph O Rychener Memphis, Tenn., Committee for Study of Retrolental Fibroplasia (joint) Dr Algernon B Reese reappointed, Committee on International Congress of Ophthalmology, 1954 Dr M Hayward Post reappointed

The following proposed substitutes for items 1 and 2 of the Provisions for Awarding the Knapp Medal were voted on and carried unanimously

1 The granting of the Knapp Medal to the author or authors of the best contribution presented at an annual meeting of the Section and worthy of this honor The eligible contributions shall include voluntary contributions, the chairman's address, papers or addresses presented by invitation, discussions of papers and reports of committees

The committee of three for the award of the Knapp Medal must report its decision not later than the second annual section meeting after its election If the committee unanimously selects a paper or other contribution for the award and this selection is approved by vote of the executive committee, the Knapp Medal is thereby awarded for the year in question If possible the medal is then to be presented by the chairman of the Committee for the Award of the Knapp Medal to the author or authors of the approved contribution

2 If the Committee for Award of the Knapp Medal is unable to make a selection unanimously, or their unanimous selection is not approved by vote of the executive committee, no award of the medal for the year in question shall be made at the annual meeting at which the committee reports If the most recent Committee on the Award of the Knapp Medal and the executive committee unanimously decide that subsequent events have demonstrated that a contribution made two or more years previously deserved the Knapp Medal it may be awarded to the author or authors with permission of the Knapp Committee of the year in question, provided that the medal has not already been awarded for this previous year If possible, when thus awarded, the medal is to be presented by the chairman of the section

It was voted that no action be taken on the report of the Committee on the International Congress of Ophthalmology that the committee be continued and that the committee be enlarged at the discretion of the section chairman It was voted that the report of the Committee on the International Congress of Ophthalmology be published, although not accepted by the section

Dr Karl W Ascher was awarded the Knapp Medal for his paper entitled, "Aqueous Veins, Their Status 11 Years After Their Detection

It was voted that Dr Derrick Vail, Chicago, be elected chairman of the Committee on the Award of the Knapp Medal, together with Dr Frederick H Verhoeff, Boston, and Dr Jonas Friedenwald, Baltimore

The Prize in Ophthalmology was given to Dr Parker Heath, Boston

It was voted that the section go on record approving the action taken by the Board of Trustees of the American Medical Association, opposing H R 2980

Dr A Franceschetti, Geneva Switzerland, read an address as the invited foreign guest of the Section

Drs Phillips Thygeson, San Jose, Calif., Michael J Hogan and Samuel J Kimura, San Francisco, presented a paper on Uveitis in Children, which was discussed by Drs Parker Heath and Charles L Schepens, Boston, A Franceschetti, Geneva, Switzerland, F A Davis, Madison, Wis., and Louis J Girard, New York

Dr John R Fair, Washington, D C., read a paper on Uveitis A Military Problem This paper was discussed by Drs Helenor C Wilder Washington, D C., Derrick Vail, Chicago, and A A Knapp, New York

Dr Bernard C Gettes, Philadelphia, read a paper on "A Clinical Report of the Use of Three New Cycloplegic Drugs" which was discussed by Drs Irving H Leopold and I S Tassman Philadelphia

THURSDAY, JUNE 4—MORNING

Dr Henry Minsky, New York, read a paper on 'Very Early Vascular Signs in the Retina in Relation to Elevated Diastolic Blood Pressure' This paper was discussed by Drs Z William Colson Lawrence, Mass., Arthur J Bedell, Albany N Y., Frank Vesey Schenectady, N Y., and Frederick A Theodore and Arthur Linksz, New York

Drs Henry E Schlegel Jr and Kenneth C Swan, Portland, Ore presented a paper on 'Dorsacaine for Rapid Corneal Anesthesia' which was discussed by Drs Harold G Scheie, Philadelphia, and Kenneth C Swan, Portland, Ore

Drs Warren S Reese and Turgut N Hamdi, Philadelphia presented a paper on 'A Preliminary Report on the Ridley Operation,' which was discussed by Drs John H Dunnington New York, Georgiana Theobald, Oak Park, Ill., Harvey E Thorpe, Pittsburgh, Derrick Vail, Chicago, and Warren S Reese, Philadelphia

Drs Elizabeth F Constantine and John M McLean, New York presented a paper on 'Contact Lenses in Aphakia' This paper was discussed by Drs Conrad Berens, Arthur Linksz, and John M McLean, New York

Drs Theodore F Schlaegel Jr and Louis N Hungerford Indianapolis, presented a paper on Isoniazid in Tuberculous Uveitis, which was discussed by Dr Merrill J King Brookline, Mass

Dr C William Weissner, Pittsburgh read a paper on 'Fibrin Film in the Treatment of Corneal Diseases' which was discussed by Drs Derrick Vail, Chicago, I S Tassman Philadelphia Irvin Levy, Trenton N J and Harvey E Thorpe, Pittsburgh

Dr Richard C Troutman New York, presented a paper on Experiences with a Magnetic Implant for Cosmetic Improvement of the Enucleation Procedure Over a Five Year Period This paper was discussed by Dr Norman L. Cutler, Wilmington, Del

SECTION ON ORTHOPEDIC SURGERY

TUESDAY, JUNE 2—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr H Relton McCarroll, St Louis

Dr Tom Outland, Harrisburg, Pa, read a paper on "The Early Roentgenographic Signs of Perthes' Disease," which was discussed by Drs Charles W Goff, Hartford, Conn, M Beckett Howorth, New York, and Maurice M Pike, Hartford, Conn

Drs Walter S Hunt Jr, and Hugh A Thompson, Raleigh, N C, presented a paper on "Panastragalar Arthrodesis" This paper was discussed by Drs Robert L Patterson, New York, Robert J Joplin, Boston, and J Albert Key, St Louis

Drs J Albert Key, Fred C Reynolds and James O Lottes, St Louis, presented a paper on 'The Treatment of Infection After Insertion of an Intramedullary Nail,' which was discussed by Drs Dana M Street, Memphis, Tenn, and David M Bosworth New York

Drs August W Spittler, Joseph W Batch and Ben A Rutledge, Washington, D C, presented a paper on "The Effects of Extensive Radiation on the Healing of Fresh Fractures," which was discussed by Drs Edgar M Bick, New York, A R Shands Jr, Wilmington, Del, and J Albert Key, St Louis

Dr Lenox D Baker, Durham, N C, read a paper on "The Triceps Surae Syndrome in Cerebral Palsy," which was discussed by Drs Charles N Pease, Chicago, and Frederick L Liebolt, New York

Drs Herbert E Pedersen and A Jackson Day, Detroit, presented a paper on Dupuytren's Contracture of the Foot" which was discussed by Drs Emanuel B Kaplan and Edward M Winant, New York, and J Vernon Luck, Los Angeles

WEDNESDAY, JUNE 3—MORNING

The following officers were elected chairman, Dr Charles N Pease, Chicago, vice chairman, Dr Jesse T Nicholson, Philadelphia, secretary, Dr Frederick R Thompson, New York, representative to the Scientific Exhibit, Dr J Vernon Luck, Los Angeles, representatives to American Board of Orthopedic Surgery, Donald E King, San Francisco, and Donald B Slocum, Eugene, Ore

The report of the delegate to the House of Delegates was presented by Dr Edward L Compere, Chicago

Dr Joseph D Godfrey and William D Dugan, Buffalo, presented a paper on Early Management of the Injured Hand," which was discussed by Drs J William Littler, New York, and George O Eaton, Baltimore

Dr Paul C Colonna, Philadelphia, read a paper on 'Spondylolisthesis,' which was discussed by Drs Frederic C Bost, San Francisco and John R Norcross, Chicago

Dr H Relton McCarroll, St Louis, read his Chairman's Address 'Has a Solution for the Unsolved Fracture Been Found?"

Drs Milton S Thompson, Fort Sam Houston, Texas, presented a paper on 'Problems in Management of Fractures of the Shaft of the Tibia' This paper was discussed by Drs John S Thieme, Norfolk, Va, Frank E Stinchfield, New York, Meyer Levin, Detroit, Lemuel D Smith, Milwaukee, and Leroy O Travis, Fort Sam Houston, Texas

Dr Bruce J Brewer, Milwaukee, read a paper on "Flake Fracture of the Astragalus, which was discussed by Drs

Nicholas J Giannestra, Cincinnati, J Albert Key, St Louis, Jesse T Nicholson, Philadelphia, and William T Green, Boston

THURSDAY, JUNE 4—MORNING

A panel discussion, "Are Bone Sarcomas Curable?" was participated in by Dr Bradley L Coley, New York, Moderator, C Howard Hatcher, Chicago, Murray M Copeland, Washington, D C, Lauren V Ackerman, St Louis, J Vernon Luck, Los Angeles, and Norman L Higinbotham, New York

The meeting adjourned at 12 40 o'clock

SECTION ON PATHOLOGY AND PHYSIOLOGY

TUESDAY, JUNE 2—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr Lall G Montgomery, Muncie, Ind

Dr Homer W Smith, New York, read a paper on "The Comparative Physiology of the Kidney," which was discussed by Dr Robert F Pitts, New York

Dr William S Hoffman, Chicago, read a paper on 'Metabolism of Uric Acid and Its Relation to Gout,' which was discussed by Drs Alexander B Gutman, New York, Max Gutmann, Brooklyn, and Homer W Smith, New York

Drs Frank W Hartman, George Magnum, A R Kelley, and Gerald A LoGrippe, Detroit, presented a paper on 'Chemical Inactivation of Viruses in Blood and Plasma' This paper was discussed by Dr Max Gutmann, Brooklyn, and, in closing Dr Hartman

Dr Israel Davidsohn, Chicago, read a paper on "Immunohematologic Studies in Hemolytic Anemia," which was discussed by Dr William Dameshek, Boston, and, in closing, Dr Davidsohn

Drs K M Brinkhous, R D Langdell, G D Penick, J B Graham and R H Wagner, Chapel Hill, N C, presented a paper on 'Newer Approaches to the Study of Hemophilia and Hemophilia Like Hemorrhagic States' This paper was discussed by Drs Matthew H Block, Chicago, Max M Strumia, Bryn Mawr, Pa, William Dameshek, Boston, Israel Davidsohn, Chicago, and, in closing, Dr Brinkhous

Dr Lysle H Peterson, Philadelphia, read a paper on 'Factors Determining Arterial Blood Pressure,' which was discussed by Dr J Earl Thomas, Philadelphia, and, in closing, Dr Peterson

Drs Charles F Geschikter and Antonette Popovici, Washington, D C presented a paper on 'Post Emphysematous Phrenic Hypertension An Analysis of 75 Cases of Chronic Asthma Complicated by Emphysema' This paper was discussed by Drs Albert H Andrews Jr, Chicago, Antonette Popovici, Washington, D C, and, in closing, Dr Geschikter

WEDNESDAY JUNE 3—MORNING

The following officers were elected chairman, Dr J Earl Thomas, Philadelphia, vice chairman, Dr Samuel Levinson, Chicago, secretary, Dr Edwin F Hirsch, Chicago, delegate, Dr Lall G Montgomery, Muncie, Ind, alternate delegate, Dr H J Corper Denver, representative to Scientific Exhibit, Frank B Queen, Portland, Ore

Dr Lall G Montgomery, Muncie, Ind, read his Chairman's Address on 'Medical Technology and Its Relation to Physiology and Pathology"

Dr M I Gregersen, New York, presented a paper on "Blood Volume Evaluation of Methods of Interpretation of Results"

Dr S E Gould, Eloise, Mich, presented a paper on "Control of Trichinosis by Irradiation of Pork," which was discussed by Drs Henry J Gomborg and Frank H Bethell, Ann Arbor, Mich, and Vernon B Link, Atlanta, Ga

A paper on 'Diffuse Interstitial Fibrosis of the Lungs' by Drs Alfred Golden and Theodore T Bronk, Buffalo, was presented by Dr Golden, and was discussed by Drs Maurice N Richter, New York, and Milton G Bohrod, Rochester, N Y

A paper on 'Atypical Adenomas of the Thyroid' by Drs John B Hazard and Rex E Kenyon, Cleveland was presented by Dr Hazard

A paper on Distribution of Thyroid Cancer in Thyroid Glands with Discussion of Clinical Significance in Treatment by Drs William O Russell, R Lee Clark Jr, and Candido de Oliveira, Houston Texas, was presented by Dr Russell, and was discussed by Dr W A D Anderson, Milwaukee Wis

A paper on Histologic Classification and Prognosis of Hydatidiform Moles" by Drs Hugh G Grady, Gaithersburg Md, and Charles I Bryans Jr, Augusta, Ga, was presented by Dr Grady This paper was discussed by Dr George Milles, Chicago

Dr I J Pincus, Philadelphia, presented a paper on "A Hyperglycemic Agent in Pancreatic Extracts A Possible Factor in Certain Types of Diabetes" The prepared discussion of Dr Rachmiel Levine, Chicago, was read by Dr Edwin F Hirsch, Chicago

THURSDAY, JUNE 4—MORNING

A joint meeting was held with the Section on Gastroenterology and Proctology The proceedings are reported in the minutes of that section

SECTION ON PEDIATRICS

TUESDAY, JUNE 2—AFTERNOON

Joint Meeting with Section on Radiology

The meeting was called to order at 2 o'clock by the chairman of the Section on Radiology, Dr Paul C Hodges, Chicago

Dr George Cooper Jr, McLemore Birdsong and Randolph G Bradshaw, Charlottesville, Va, presented a paper on Emergencies in the New Born This paper was discussed by Drs Fred H Wilke, New York, and Paul C Hodges, Chicago

Drs John F Holt and Howard B Latourette, Ann Arbor, Mich, presented a paper on Physiological Bowing of the Legs in Young Children, which was discussed by Dr Kenneth D A Allen, Denver

Drs J A Campbell and David C Gastineau, Indianapolis presented a paper on Specificity of Roentgen Findings in Suppurative Pneumonia of Infants and Children, which was discussed by Dr Fred Jenner Hodges, Ann Arbor, Mich

Drs Raymond G McDonald and William A Evans Jr, Detroit, presented a paper on "Hirschsprungs Disease The Roentgen Diagnosis in Infants and Young Children" This paper was discussed by Drs George P Keefer, Philadelphia, and Joseph Golomb, Bronx, N Y

Drs John P Caffey and Ruth C Harris, New York presented a paper on Cholecystography During the First Months of Life," which was discussed by Dr Frederick N Silverman, Cincinnati

Dr Edward B D Neuhauser, Boston, read a paper on Lesions of the Esophagus in Infancy" This paper was discussed by Drs William H Shehadi, New York, and Woodruff L Crawford, Rockford, Ill

WEDNESDAY, JUNE 3—AFTERNOON

The following officers were elected chairman, Dr Oliver L Stringfield, Stamford, Conn, vice chairman, Dr William W Belford San Diego, Calif secretary, Dr Wyman C C Cole, Detroit, representative to Scientific Exhibit, F Thomas Mitchell, Memphis, Tenn, custodian of the Jacobi Fund, Hugh L Dwyer, Kansas City, Mo, delegate, Woodruff L Crawford, Rockford Ill, alternate delegate, Walter B Stewart, Atlantic City, N J

Dr Eugene T McEnery, Chicago, read his Chairman's Address

Symposium on Prevention of Needless Neonatal Deaths

Dr Herman N Bundesen, Chicago, read a paper entitled "From the Viewpoint of the Public Health Officer," which was discussed by Drs Joseph G Molner, Detroit, and Samuel M Wishik Pittsburgh

Dr Charles U Letourneau, Chicago, read a paper entitled "From the Viewpoint of the Hospital Administrator" This paper was discussed by Drs Anthony J J Rourke, New York, and Richard D Mills, Boston

Dr Stewart H Clifford, Brookline, Mass, read a paper entitled "From the Viewpoint of the Pediatrician"

Dr Carl P Huber, Indianapolis, read a paper entitled "From the Viewpoint of the Obstetrician," which was discussed by Drs Carl Goldmark Jr, New York, Nicholson J Eastman, Baltimore, and H R Litchfield, Brooklyn

THURSDAY, JUNE 4—AFTERNOON

Joint Meeting with Section on Physical Medicine and Rehabilitation and Section on Preventive and Industrial Medicine and Public Health

Dr Vlado A Getting, Boston, chairman of the Section on Preventive and Industrial Medicine and Public Health, read his Chairman's Address

Dr Joseph A Bell, Bethesda, Md, read a paper on Epidemiologic Aspects of the Uses of Gamma Globulin in Poliomyelitis"

Dr W H Aufranc Washington, D C, read a paper on "National Policies Relative to the Distribution of Gamma Globulin"

Dr Albert B Sabin, Cincinnati, read a paper on "Present Status and Future Possibilities of Vaccine for the Control of Poliomyelitis"

Dr Clifford G Grulee Jr, New Orleans, read a paper on "Differential Diagnosis of Poliomyelitis"

Dr Kristian G Hansson, New York, Chairman of the Section on Physical Medicine and Rehabilitation, assumed the Chair

Dr Alex J Steigman, Louisville, Ky., read a paper on "Treatment of Acute Phase of Poliomyelitis"

Dr Jessie Wright, Pittsburgh, read a paper on 'The Early Treatment of Poliomyelitis' This paper was discussed by Dr Duane A Schram, Gonzales, Texas

Dr Robert L Bennett Jr, Warm Springs, Ga, read a paper on 'Methods of Preventing Deformity and Restoring Effective Muscle Activity' This paper was discussed by Dr Morton Hoberman, New York

SECTION ON PHYSICAL MEDICINE AND REHABILITATION

TUESDAY, JUNE 2—MORNING

Panel on Geriatrics

The meeting was called to order at 9 05 o'clock by the chairman, Dr Kristian G Hansson, New York

The Chairman's Address, 'Body Mechanics in Geriatrics,' was presented by Dr Kristian G Hansson, New York

A paper entitled 'Rehabilitation in General in Geriatrics' by Dr Edward J Lorenze, White Plains, N Y, was presented

A paper entitled 'Physical Medicine and Rehabilitation for the Elderly Neurologic Patient' by Dr Arthur L Watkins, Boston, was presented

A paper entitled 'Peripheral Vascular Disease in Geriatrics' by Dr Charles S Wise, Washington, D C, was presented

A paper entitled 'Medical Aspects of Physical Treatment in Geriatrics' by Dr Harold Dinken, Denver, was presented

General discussion from the floor followed, with Dr Kristian G Hansson New York, acting as moderator

WEDNESDAY, JUNE 3—MORNING

The following officers were elected chairman, Dr Walter Solomon, Cleveland, vice chairman, Dr William Schmidt, Philadelphia, secretary, Dr Walter J Zeiter, Cleveland, delegate, Dr Frank H Krusen, Rochester, Minn, alternate delegate, Dr Arthur L Watkins, Boston

Panel on Arthritis

With Dr Frank H Krusen Rochester, Minn, acting as moderator, the following papers were presented

'Classification of Arthritis' by Dr Robert M Stecher, Cleveland

'Rehabilitation in Arthritis' by Dr Donald L Rose, Kansas City Kan,

'Surgery in the Rehabilitation of the Arthritic' by Dr Lee Ramsay Straub, New York, and

'Medication for Arthritis' by Dr Richard H Freyberg, New York

Discussion from the floor followed

THURSDAY, JUNE 4—AFTERNOON

A joint meeting was held with the Section on Pediatrics and the Section on Preventive and Industrial Medicine and Public Health The proceedings are reported in the minutes of the Section on Pediatrics

SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

TUESDAY, JUNE 2—MORNING

The meeting was called to order at 9 05 o'clock by the chairman, Dr Vlado A Getting, Boston

Panel on Civil Defense

Dr Kenneth C Charron, Ottawa, Canada, presented a paper on 'Health Programs in Civil Defense'

A paper on 'Emergency Public Health and Sanitation' by Drs Robert H Flinn and E K Erickson, Washington, D C, was given by Dr Flinn

Dr John B Alsever, Washington, D C, presented a paper on 'Blood Derivatives and Plasma Volume Expanders'

Dr James H Defandorf, Washington, D C, presented a paper on 'Civil Defense in Chemical Warfare'

Dr John J Phair, Cincinnati, presented a paper on 'Civil Defense for Biological Warfare'

Dr M N Newquist, New York, N Y, presented a paper on 'Civil Defense in Industry'

Dr Carlisle S Lentz, Washington, D C, presented a paper on 'Improvised Hospitals'

Dr Carl A Wilsbach, Cincinnati presented a paper on 'Medical Civil Defense in Target Cities'

Dr Frank L Cole, San Francisco, California, presented a paper on 'State Civil Defense Programs'

A general discussion period was conducted among the members of the audience and the participants in the program.

WEDNESDAY, JUNE 3—MORNING

The following officers were elected chairman, Jean S Felfon, Oak Ridge, Tenn, vice chairman, John J Phair, Cincinnati, secretary, Frank Princi, Cincinnati, nominating committee, Carl Neupert Madison, Wis, James Sierner, Rochester N Y, and Adolph Kammer, Pittsburgh

Dr James P Hughes, Cincinnati read a paper on 'Industrial Medical Service by Private Practitioners' This paper was discussed by Drs Glen S Everts, Philadelphia Charles F Shook, Toledo, Ohio Edward M Gunn, Hartsville, S C, and John J Snyder, Harrisburg, Pa

Dr R G Bell, Ontario, Canada, read a paper on 'Clinical Prevention of Alcoholism by the Industrial Health Department, which was discussed by Drs Walter B Quisenberry, Honolulu, Charles Franco, New York, and W D Schmidt, Westbury, N Y

Dr Charles E Dutchess, New York, read a paper on 'Criteria for Retirement in Industry'

Dr E M Kline, Cleveland, read a paper on 'Role of the Physician in the Employment of the Cardiac Worker,' which was discussed by Drs C J Bogucki Detroit, and John J Thorpe and Adelaide Romaine, New York

Dr Raymond R Suskind, Cincinnati, read a paper on 'An Industrial and Laboratory Evaluation of the Silicone Protective Cream' This paper was discussed by Drs Herbert Mescon, Boston Roy Milne Seideman, Hartford, Conn, Raymond Murray, Great Neck, N Y, Arpad G Gerard, Woodbridge, N J, and Edmund Finnerty, Boston

THURSDAY, JUNE 4—AFTERNOON

A joint meeting was held with the Section on Pediatrics and the Section on Physical Medicine and Rehabilitation. The proceedings are reported in the minutes of the Section on Pediatrics.

SECTION ON RADIOLOGY

TUESDAY, JUNE 2—AFTERNOON

A joint meeting was held with the Section on Pediatrics. The proceedings are reported in the minutes of the Section on Pediatrics.

WEDNESDAY, JUNE 3—AFTERNOON

The following officers were elected chairman, Kenneth D A Allen, Denver, vice chairman, Laurence L Robbins, Boston, representative to Scientific Exhibit, Richard H Chamberlain, Philadelphia.

Dr Paul C Hodges, Chicago, read his Chairman's Address, entitled "Roentgen Examination of the Colon."

Drs Arno W Sommer and W A Goodrich, Temple, Texas, presented a paper on "Gastric Diverticula."

Dr Samuel S Richman, Richmond, Va., read a paper on "Roentgen Aspects of Some Benign and Malignant Ulcerations of the Stomach."

The papers of Drs Sommer and Goodrich and Dr Richman were discussed by Drs Ross Golden, New York, and Theodore S West, Port Chester, N Y.

Drs Paul C Swenson and Robert B Jeffrey, Philadelphia, presented a paper on "The Limitations of the Diagnostic Procedures of the Roentgenologic Examination of the Gastrointestinal Tract," which was discussed by Dr Kenneth E Fry, Philadelphia.

Drs Cesare Gianturco and George A Miller, Urbana, Ill., presented a paper on "Routine Search for Colonic Polyps by High Voltage Roentgenography." This paper was discussed by Drs Charles H Drenckhahn, Urbana, Ill., Kenneth D A Allen, Denver, Ross Golden, New York, A W Martin Marino, Brooklyn, and Philip J Hodes, Philadelphia.

Drs Ross Golden and Pablo Morales, New York, presented a paper on "X-Ray Examination in Organic Disease of the Small Intestine," which was discussed by Dr Philip J Hodes, Philadelphia.

THURSDAY, JUNE 4—AFTERNOON

Drs John G Trump and Hugh F Hare, Boston, presented a paper on "Observations on Rotational Therapy with Two Million Volt Roentgen Rays," which was discussed by Dr Morton M Kligerman, New York.

Drs Roger A Harvey, Lewis L Haas and Seymour S Langer, Chicago, presented a paper on "The Radiation Management of Otherwise Hopeless Thoracic Neoplasms." This paper was discussed by Drs Theodore P Eberhard, Philadelphia, and Maurice Lenz, New York.

Dr Carl B Braestrup, New York, read a paper on "Design of Radioisotope Laboratories for General Hospitals."

Dr Edith H Qumby, New York, read a paper on "The Radioisotope Program in the General Hospital."

The papers of Dr Braestrup and Dr Qumby were discussed by Drs Sergei Feitelberg, New York, and Theodore P Eberhard, Philadelphia.

Drs R W Emerick, L E Holly, A H Joistad, and K E Corrigan, Muskegon, Mich., presented a paper on "Diagnostic

Use of Radioisotopes in a General Hospital." Dr Carleton B Peirce, Montreal, Canada, read a paper on "Therapeutic Value of Radioisotopes in a General Hospital." These two papers were discussed by Drs Hymer L Friedell, Cleveland, Bernard Roswit, New York, W Edward Chamberlain, Philadelphia, K E Corrigan, Muskegon, Mich., and Sergei Feitelberg, New York.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

TUESDAY, JUNE 2—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman Dr I Ridgeway Trimble, Baltimore.

A paper by Drs R Russell Best, John A Rasmussen and Carlyle E Wilson, Omaha, on "The Management of Remaining Common Duct Stones by Various Solvents and the Biliary Flush Regimen," was presented. This paper was discussed by Drs Waltman Walters, Rochester, Minn., and Frank Glenn, New York.

Dr Frank F Allbritten Jr, Philadelphia, read a paper on "Chronic Pancreatitis and Associated Stenosis of the Common Bile Duct Treatment by Roux Y Choledochojunostomy," which was discussed by Drs John H Mulholland, New York, and Jonathan E Rhoads, Philadelphia.

Dr Ralph F Bowers, Memphis, Tenn., read a paper on "Bilateral Adrenalectomy for Severe Hypertension." This paper was discussed by Drs Harold A Zintel, and William A Jeffers, Philadelphia, and Frederick M Allen, New York.

Dr John D Stewart, Buffalo, read a paper on "Surgery of the Elderly," which was discussed by Drs Guy Alfano, Buffalo, Louis Carp, New York, and Warren H Cole, Chicago.

Dr Kenneth W Warren, Boston, read a paper on "Pancreatic Consideration in Gastric Surgery," which was discussed by Drs Frank H Lahey, Boston, and Robert J Coffey, Washington D C.

Drs J W Kirklín, J M Waugh, J H Grindlay, C R Openshaw, and Edgar V Allen, Rochester, Minn., presented a paper on "The Surgical Treatment of Arteriosclerotic Aneurysms of the Abdominal Aorta." This paper was discussed by Drs Arthur H Blakemore, New York, Geza de Takats, Chicago, Henry Bahnson, Baltimore, and Michael E De Bakey, Houston, Texas.

WEDNESDAY, JUNE 3—AFTERNOON

Dr I Ridgeway Trimble, Baltimore, read his Chairman's Address.

Dr Julian Johnson, Philadelphia, read a paper on "The Treatment of Cardiac Arrest and Ventricular Fibrillation," which was discussed by Drs Claude S Beck, Cleveland, E M Papper, New York, and Julian Johnson, Philadelphia.

Dr Robert E Gross, Boston, read a paper on "The Treatment of Interauricular Septal Defects." This paper was discussed by Drs Henry Swan, Denver, George H Humphreys II, New York, Charles P Bailey, Philadelphia, and Robert E Gross, Boston.

Dr F D Dodrill, Detroit, read a paper on "Some Experiences with the Mechanical Heart in Human Surgery," which was discussed by Drs John H Gibbon and Charles P Bailey, Philadelphia.

Dr Frank L Meleney and Balbina A Johnson, New York, read a paper on "The Rational Use of Antibiotic Therapy in the Control of Surgical Infections," which was discussed by Dr William R Sandusky, Charlottesville, Va.

The following officers were elected chairman, Dr Emile F Holman, San Francisco, vice chairman, Dr Robert M Zollinger, Columbus Ohio, secretary, Dr Walter G Maddock, Chicago delegate, Dr Grover C Penberthy, Detroit, and representative to Scientific Exhibit, Dr John H Mulholland, New York

THURSDAY, JUNE 4—AFTERNOON

Dr Orvar Swenson, Boston, read a paper on 'The Modern Treatment of Hirschsprung's Disease,' which was discussed by Drs C Everett Koop, Philadelphia, and Robert B Hiatt, New York

Dr C Paul Boyan, New York, read a paper on "Hypotensive Anesthesia for Radical Pelvic and Abdominal Surgery" This paper was discussed by Drs Alexander Brunschwig and Charles L Burstein, New York

Drs E H Ellison and Robert M Zollinger, Columbus, Ohio, presented a paper on 'Nutrition Following Gastric Operations' This paper was discussed by Drs Samuel A Levinson, Chicago, and William E Abbott, Cleveland

A paper on 'The Low Sodium Syndrome in Surgical Patients Deficiency, Maldistribution or Dilution?' was presented by Drs Francis D Moore, Graham Wilson, Laura Brooks, and J Allan Myrden, Boston, and was discussed by Drs H T Randall, New York, James D Hardy, Memphis, Tenn, Charles Fox, New York, and Francis D Moore, Boston

Dr Edgar J Poth, Galveston, Texas, read a paper on 'The Application of Intestinal Antisepsis in Surgery,' which was discussed by Drs Warfield M Firor, Baltimore, and Robert A Scarborough, San Francisco

Dr Clarence Dennis, Pelham Manor, N Y, read a paper on 'Current Procedure in the Management of Small Bowel Obstruction' This paper was discussed by Drs Leland S McKittrick, Brookline, Mass, Walter G Maddock, Chicago, and John Devine Jr, Lynchburg, Va

SECTION ON UROLOGY

TUESDAY, JUNE 2—MORNING

The meeting was called to order at 9 15 o'clock by the chairman, Dr Earl E Ewert, Boston

A paper entitled 'The Management of Kidney Injuries' by Drs Harry M Spence, Sidney S Baird, and Elgin W Ware, Dallas, Texas, was presented

A paper entitled 'Injuries of the Ureter' by Drs Hamilton W McKay, H Haynes Baird and Homer R Justis, Charlotte, N C, was given

Dr George C Prather, Brookline, Mass, presented a paper entitled 'Injuries of the Bladder'

'The Management of Urethral Injuries,' a paper by Dr William J Baker, Chicago, was presented

Discussion on the foregoing papers was presented by Drs Moses Swick, New York, G Franklin Farman, Whittier, Calif and Charles S Levy, Baltimore

The first paper in a symposium on male fertility was presented by Dr John MacLeod, New York, entitled "The Male Factors in Infertility"

Dr Vincent J O'Connor, Chicago, presented a paper on "Mechanical Aspects and Surgical Correction of Male Sterility"

A paper entitled "Endocrinological Aspects of Male Infertility" by Dr Peter M F Bishop, London, England, was given, and was discussed by Drs Robert S Hotchkiss, New York, and Norris J Heckel, Chicago

WEDNESDAY, JUNE 3—MORNING

The following officers were elected chairman, Dr Rex E Van Duzen, Dallas, Texas, vice chairman, Dr Charles C Higgins, Cleveland, secretary, Dr Rubin H Flocks, Iowa City, delegate, Dr Jay J Crane, Los Angeles, alternate, Dr Earl E Ewert, Boston, and chairman of exhibits, Roger W Barnes, Los Angeles

Dr Earl E Ewert, Boston, read his Chairman's Address on 'The Effect of Supravoltage Rotational X Ray Therapy on Extensive Carcinoma of the Bladder'

Dr Charles C Higgins, Cleveland, read a paper on "The Clinical Significance of Hematuria," which was discussed by Dr Laurence F Greene, Rochester, Minn

Symposium on the Neurogenic Bladder

Drs Charles N Duncan and Rex E Van Duzen, Dallas, Texas, presented a paper on 'Anatomy and Physiology of the Urinary Bladder'

Drs Reed M Nesbit and William C Baum, Ann Arbor, Mich, presented a paper on 'Cystometry, the Reflex Hammer of Bladder Activity'

Dr Tracy O Powell, Los Angeles, read a paper on "The Clinical Management of Urinary Retention in Children"

Dr Gershom J Thompson, Rochester, Minn, read a paper on 'Practical Points in the Management of the Cord Bladder'

The papers presented in the symposium were discussed by Drs Lowrain E McCrea, Philadelphia, James C Sargent, Milwaukee, William P Herbst, Washington, D C, Donald C Malcolm, Long Beach, Calif, Rex E Van Duzen, Dallas, Texas, and Tracy O Powell, Los Angeles

THURSDAY, JUNE 4—MORNING

Dr Dean Parker, Seattle, read a paper on 'The Treatment of Urinary Tract Infections'

Dr Russell B Carson, Fort Lauderdale, Fla, read a paper on 'The Management of Vesicourethral Dysfunction in Women'

Dr Harold A O'Brien, Dallas, Texas, read a paper on 'The Management of Bladder Irritation in the Female'

The above papers were discussed by Drs Ormund S Culp, Rochester, Minn, Harry M Spence, Dallas, Texas, and, in closing, Drs Parker, Carson and O'Brien

Drs John K Lattimer and Archie L Dean, New York, presented a paper on 'Radical Prostatectomy'

Drs J C Kimbrough and Ferris E Cook, Washington, D C, presented a paper on 'Carcinoma of the Testicle'

The above two papers were discussed by Drs John A Taylor, New York, Roger W Barnes, Los Angeles, Elmer Belt, Los Angeles, and, in closing, Dr Lattimer and Dr Kimbrough

Drs Fred Z Havens Sr, and T J Litzow, Rochester, Minn., presented a paper on 'Treatment of Hypospadias,' which was discussed by Dr Victor F Marshall, New York, and, in closing, Dr Havens

MEDICAL NEWS

ARKANSAS

Dr Morris Appointed Associate Dean—Dr Woodbridge E Morris, associate clinical professor of medicine, University of Arkansas School of Medicine, Little Rock, has been appointed associate dean. Dr Morris has been affiliated with Trinity Hospital and Clinic, Arkansas Children's Home and Hospital, St Vincent Infirmary, and Arkansas Baptist Hospital, and with Johns Hopkins Hospital, Baltimore, and Henry Ford Hospital, Detroit. He served as director of the maternal and child health service in Delaware, where, with his wife, he organized the crippled children's service. Dr Morris is president of the Pulaski County Tuberculosis Association and chairman of the Health Council of Greater Little Rock.

CALIFORNIA

Dr Eymundson Retires—After 30 years on the staff of St Francis Memorial Hospital, San Francisco, Dr Kristbjorn S Eymundson retired to private life May 1. At a recent staff meeting, a resolution was read that said in part, "Be it resolved that the Medical Staff and the Board of Trustees of Saint Francis Memorial Hospital do thank K S Eymundson, M.D., for his years of devoted service, constant attention to employees and student nurses without remuneration of any kind, and, be it further resolved that the aforesaid Ben Eymundson be and hereby is granted whatever use of our facilities and friendship he shall care to have in the many years which we trust are before him." Dr Eymundson was presented with a perpetual clock by the advisory council and board of trustees at the Bohemian Club.

Mental Hygiene Program—Dr Norman Q Brill has been selected to head a coordinated mental hygiene program by the University of California at Los Angeles School of Medicine and the state department of mental hygiene. Dr Brill will serve both as chairman of the department of psychiatry at the new medical center and as director of a state department mental hygiene unit to be built near the Los Angeles campus. He was deputy chief of the neuropsychiatry division of the Army Surgeon General's office in 1945-1946 and served as head of the department of neurology at the Georgetown University School of Medicine, Washington, D.C., for several years. The campus program at the medical center is primarily directed toward undergraduate professional training and basic research while the program at the state department includes postgraduate professional training and clinical research.

COLORADO

Gerald Webb Memorial Laboratory—Cornerstone laying ceremonies for the Gerald B Webb Memorial Laboratory were recently held at the University of Colorado Medical Center, Denver. The \$150,000 structure is being built by the Colorado Foundation for Research in Tuberculosis, established 29 years ago in Colorado Springs by the late Dr Webb and supported by private contributions from his friends and former patients. The foundation has received an endowment of \$200,000, the income from which supports its research, according to Dr James J Waring, president of the board of trustees. Research under way is concerned with evaluating present antibiotics for tuberculosis, developing a faster method for culturing the tubercle bacillus, and studying new antibiotics. Results of several years of research, done while the foundation had its laboratories at Colorado College in Colorado Springs, have been incorporated in a book, now in press, entitled "The Metabolism of the Tubercle Bacillus," written by Dr William F Drea of the foundation with the joint authorship of A Andrejew of the Pasteur Institute of Paris.

Physicians are invited to send to this department items of news of general interest for example those relating to society activities, new hospitals, education and public health programs should be received at least three weeks before the date of meeting.

Course in Infectious Diseases—The department of medicine and the Office of Graduate and Postgraduate Medical Education of the University of Colorado School of Medicine, Denver, will sponsor a postgraduate course on infectious diseases Aug 17-19. Among the topics of special interest will be the rickettsial diseases prevalent in the Rocky Mountain states and diseases of virus etiology. Guest lecturers will include Dr William M M Kirby, associate professor of medicine, University of Washington School of Medicine, Seattle, and Herald R Cox, ScD, director of viral and rickettsial research, Lederle Laboratories Division, Pearl River, N.Y. For information write to the Office of Graduate and Postgraduate Education, University of Colorado Medical Center, 4200 E Ninth Ave., Denver 20.

CONNECTICUT

Grace-New Haven Community Hospital—The recently dedicated Memorial Unit of the Grace-New Haven Community Hospital increases the potential bed capacity of the hospital, available for service to the community and instruction of Yale medical students, to over 800 beds. Funds for the 10 story 337 bed general hospital were raised by public subscription.

Grace New Haven Community Hospital

in the hospital's service area, the total cost of the hospital building and associated laundry, nurses home, and tunnel to the New Haven unit being close to 10 million dollars. The unit has facilities for all services except pediatrics and psychiatry, including operating rooms, laboratories, and a large radiology department.

Personal—Dr Grover F Powers, professor emeritus of pediatrics at Yale University School of Medicine, New Haven, has been named chairman of a 25 member national board to direct research on mental retardation, according to the National Association for Retarded Children, which is sponsoring the research board. Dr Powers, a consultant and fellow of the American Academy of Pediatrics, in 1947 received the Borden award for research in infant and child nutrition. After a period of three years, Dr Ralph M Tovell, Hartford, will retire July 1 as chairman of the VA Council of Chief Consultants. He will be succeeded by Dr Albert M Snell of Palo Alto, Calif. Dr Tovell is chief, department of anesthesiology, Hartford Hospital. Dr Francis J Ryan, assistant chief medical officer of the Hartford regional office, Veterans Administration, for the past seven years, recently was appointed chief medical officer. Dr Ryan, who joined the VA in 1939 as a ward surgeon, has served with the administration in hospitals in Arkansas, Maryland, and Connecticut. He served with the Army Medical Corps during World War II.

DISTRICT OF COLUMBIA

Professors Emeriti—At its commencement May 27, George Washington University, Washington, D. C., conferred the rank of professor emeritus on Dr. Daniel L. Borden, clinical professor of surgery, and Dr. Paul F. Dickens, clinical professor of medicine. Dr. Borden, a past president of the Medical Society of the District of Columbia, joined the faculty of the George Washington University School of Medicine as associate in surgery in 1912. He will continue as director of health administration to the university. Dr. Dickens, who has served as clinical professor of medicine since 1929, has also been professor of medicine at the U. S. Naval Medical School (1925-1938).

GEORGIA

Society News—At a recent meeting of the Atlanta Radiological Society the following officers were elected: president, Dr. Calvin B. Stewart, Atlanta; vice-president, Dr. Ted F. Leigh, Emory University; and secretary, Dr. Albert A. Rayle, Jr., Atlanta.

G. Lombard Kelly Retires as President of College—Dr. G. Lombard Kelly has retired from the presidency of the Medical College of Georgia, Augusta, after an affiliation of 35 years that began when he came to the medical college as instructor in anatomy. In 1934 Dr. Kelly was named dean of the college, and in 1950 was made its president. Dr. Edgar R. Pund, who has held the chair of pathology for 20 years, succeeded Dr. Kelly July 1. The latter, who will remain a few months longer as his advisor and consultant, plans in the fall to become an associate in the department of endocrinology.

Warm Springs Foundation Plans Expansion—Dr. Robert L. Bennett, for many years assistant medical director in charge of physical medicine at Georgia Warm Springs Foundation, has been appointed medical director. Dr. Bennett, who is professor of physical medicine at Emory University School of Medicine, has served as secretary-treasurer of the American Board of Physical Medicine and Rehabilitation and is a past president of the American Congress of Physical Medicine and Rehabilitation. Drs. Charles E. Irwin, Hal S. Raper, and Thomas Gucker III will continue in their present positions of director of orthopedic surgery, director of internal medicine, and assistant director of orthopedic surgery, respectively, and Dr. Harry W. Mims will serve as assistant director of physical medicine and rehabilitation. Because of the demands for patient care and the ability of most communities to handle the after-effects of poliomyelitis, an evaluation service for physicians referring patients to Warm Springs has been designed to assist the local physician in complete care of the patients. On request of the referring physician, the patient may be fitted with necessary supportive, assistive, or adaptive apparatus, and home routine will be shown the patient and/or his family. The foundation will continue to treat poliomyelitis patients through the inpatient services of physical medicine and orthopedic surgery. Its facilities will still be devoted primarily to the care of the after-effects of poliomyelitis, but other problems resulting in physical handicap requiring similar rehabilitative measures will be studied.

ILLINOIS

Walter Reed Society Honors Dr. Koritz—At its annual meeting in Chicago the Walter Reed Society, composed of persons who have served as volunteer subjects for experimental research, honored Dr. Lloyd Thomas Koritz, Chicago. The citation states that many lives are being saved through the use of new methods of rendering artificial respiration to victims of drowning or electric shock, as a result of the experiments to which Dr. Koritz subjected himself and that resulted in a new type of push pull respiration.

As part of the experiments Dr. Koritz was hung from a telephone pole with lineman's straps and climbing irons, curare and sodium thiopental (Pentothal) were administered, and artificial respiration was applied. It was found that the new resuscitation method saved time in starting artificial respiration of linemen shocked while on poles. In another experiment, dealing with metabolism studies, Dr. Koritz ingested a pound

of homogenized raw liver daily for a month. Dr. Koritz, who is serving his internship at Cook County Hospital in Chicago, plans to enter general practice in his home town, Rochelle, with Dr. Arthur R. Bogue, who first encouraged him to become a physician.

Chicago

Gift to Hektoen Institute—A check for \$10,000 was recently given to the Hektoen Institute for Medical Research at Cook County Hospital by the Dr. Julian D. Levinson Foundation, which has contributed \$50,000 to the institute during the last two years.

Memorial Lecture—The Frederick Robert Zeit Memorial Lecture, sponsored by Alpha Kappa Kappa fraternity, was recently presented in Thorne Hall of Northwestern University by Dr. Walter C. Alvarez, professorial lecturer in medicine, University of Illinois College of Medicine. Dr. Alvarez spoke on "Some Problems in Modern Diagnosis."

Anesthesiologists Honor Dr. Luckhardt—On the 30th anniversary of his discovery of the use of ethylene gas for anesthesia, Dr. Arno B. Luckhardt was honored at a party given by the division of anesthesiology, University of Chicago School of Medicine. In addition to members of the present staff, persons concerned with the original experiments were present. Dr. J. Bailey Carter, who was Dr. Luckhardt's assistant, Dr. Carl A. Dragstedt, who turned anesthesiologist for the occasion of the first human experiment on Drs. Luckhardt and Carter, Dr. Edwin M. Miller, the first surgeon to use ethylene, Dr. Edward D. Allen, the first obstetrician who administered the gas to Mrs. Luckhardt and to Mrs. Dragstedt in childbirth, and Anton J. Carlson, Ph.D.

Personal—Dr. John H. Pribble has been named chief medical examiner for the Illinois Athletic Commission. —Dr. Paul Chesley Hodges, professor of radiology, University of Chicago School of Medicine, recently presented the annual lecture on "Fibrous Dysplasia of Bone" for Alpha Omega Alpha of the University of Wisconsin Medical School, Madison. —Dr. Leon Unger has returned from a trip, during which he lectured on bronchial asthma and migraine before medical societies in Hawaii, Japan, Hong Kong, Siam, Pakistan, Calcutta, New Delhi, and Poona in India, Haifa and Jerusalem in Israel, and Athens, Greece, some of these lectures were held under the auspices of the American College of Chest Physicians. —Dr. Robert H. Ebert, professor of medicine, University of Chicago Medical School, recently presented the William Snow Miller Memorial Lecture on "Changes in Connective Tissue Reaction Induced by Cortisone" at the University of Wisconsin Medical School, Madison. —Dr. James P. Simonds, professor emeritus of pathology, Northwestern University Medical School, was guest of honor at an open house in the Cancer Prevention Center of Chicago, 17 W. Huron St., to mark the 10th anniversary of its cancer prevention clinic. Dr. Simonds was president of the Chicago Medical Society when the clinic first opened.

INDIANA

Medical Advisory Committee—Gov. George N. Craig has appointed as his medical advisory committee Drs. Dillon D. Geiger, Bloomington, chairman, Margaret E. Morgan, Austin, Bert E. Ellis, Indianapolis, past president of the Indianapolis Medical Society, E. Vernon Hahn, Indianapolis, and William H. Howard, Hammond, president-elect of the Indiana State Medical Association.

Dr. J. H. Combs Honored—Dr. John H. Combs, Evansville, was recently honored at the annual dinner of the medical and surgical staff of the Welborn Memorial Baptist Hospital, when an award 'in appreciation of his self-sacrifices, his unwavering devotion to his profession, and the great assistance he has given the staff of the hospital' was given him. It was the request of the hospital staff that the new Jewett Refrigerator Bank, which it was presenting to the hospital, be named the John H. Combs Blood Bank. Dr. Combs has been affiliated with the hospital for many years.

IOWA

Merit Awards—At the annual meeting in Des Moines the Iowa State Medical Society presented awards of merit to (1) Dr Harold E Farnsworth, Storm Lake, who served for many years as a member and as chairman of the society's Committee on Child Health and Protection, and for the past three years has been active with the state board of medical examiners, (2) Dr Charles T Maxwell, Sioux City, former chairman of the committee on medical economics (3) Dr Gordon F Harkness, Davenport, former trustee and president of the society, and (4) Dr Lee Roy Woodward, Mason City, former committee member, district councilor, trustee, president-elect, and president.

KENTUCKY

Howard Award to Dr Hiestand—Dr Clement V Hiestand, mayor of Campbellsville, was recently given the E M Howard award, a gold key, by the Kentucky Academy of General Practice Dr Hiestand, who is 82 years old, is a former member of the Taylor County Board of Education and is chairman of the County Board of Health He has headed the Muldraugh Hill Medical Society, the Tri-County Medical Society, and the medical staff at Campbellsville's Rosary Hospital

University News—The University of Louisville School of Medicine has appointed Dr Robert E Bruner associate professor of neurology and has promoted Drs Irving O Dein, Lewis L. Levy, and Richard P Schmidt to the rank of assistant professors of neurology Dr James C Moore has been named assistant professor of physiology—Dr Walter S Coe, assistant professor of medicine, University of Louisville School of Medicine, has been awarded an A Blaine Brower Traveling Scholarship by the American College of Physicians, which permits him to spend one month visiting any medical center of choice—The school also reports the establishment of the Floyd Brewer Memorial Foundation by Dr Walter E Brewer, the fund to be used to render assistance to medical education and research, specifically as a loan fund for students and interns—A new chair in the department of internal medicine, to be called the John Walker Moore Professorship of Medicine, has been approved by the board of trustees, and three new sections have been established in the department of medicine (1) rheumatic diseases Dr Robert L. McClendon, chief, (2) hematology, Dr Marion F Beard, chief and (3) endocrinology, Dr James R Hendon, chief—Dr John H F Marchand, instructor in medicine at Cornell University Medical College, New York, has been appointed associate professor in the department of medicine and medical director of the newly organized University of Louisville Poliomyelitis Respirator Care Center

LOUISIANA

State Medical Election—At its annual meeting in New Orleans the Louisiana State Medical Society elected the following officers president, Dr Philip H. Jones, New Orleans president-elect, Dr Walter O Moss Lake Charles vice presidents, Drs Cuthbert J Brown, New Orleans, W Kernan Irwin, Baton Rouge, and Milton Maxwell Hattaway, New Orleans, and secretary treasurer (reelected) Dr C Grenes Cole, New Orleans

Eyes for Ophthalmic Research—The Louisiana State University School of Medicine, New Orleans, reports that in the last six years almost 600 human eyes have been mailed to its ophthalmic laboratory for free examination and diagnosis Diagnostic results are reported to the physician before the patient leaves the hospital, so that emergency treatment may be provided if necessary Aleta N Barber, PhD who supervises the laboratory, states that one of the greatest values of the laboratory is the help it provides in training specialists in eye diseases Courses on the development of the eye and its relationship to such conditions as congenital blindness and glaucoma and pathology courses dealing with acquired eye diseases have been taught to an average of 20 specialists annually Current research at the laboratory includes a study

of the development of the visual pathway of the eye, in an attempt to discover causes of congenital blindness, treatment of diseases causing blindness, effects of radioactive isotopes in the treatment of glaucoma, and the healing of wounds of the cornea and its significance in corneal transplants

MARYLAND

Memorial to Dr Keller—Hospitality House, a memorial honoring her late husband, Dr William S Keller, was recently presented to the Bethesda Hospital by Mrs Herbert C Shottwell It is described as 'a bright and colorful place where guests visitors, patients, doctors, nurses and staff members may drop in for gifts and refreshment' It is serviced by the Juniorades at school free hours and by mothers who assist at hours when the Juniorades are not available

Personal—Dr Charles R Foutz, past president of the Alumni Association of the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore (1923-1933), was recently honored on his 80th birthday by an open house arranged by scores of friends, medical and business associates, and townspeople of Westminster, where he has been practicing for many years Dr Foutz is a member of the Army Advisory Committee of the Second Army and a member of the board of trustees of the Maryland General Hospital, Baltimore Tribute was paid to him in an article appearing in the *Baltimore Sun*—At commencement June 5, Boston University School of Medicine bestowed on Dr Robert Hanna Felix, director of the National Institute of Mental Health, Bethesda, the honorary degree of doctor of science

MICHIGAN

Careers for Maturing Workers—This will be the theme of the University of Michigan Sixth Annual Conference on Aging in Ann Arbor, July 8-10 Discussion sections will consider economic, social, and personal values of continuing employment, the maturing worker from the standpoint of health, age, skill, and motivation as factors in adjustment of the older worker, counseling, guidance, placement, and training continuing employment in business and industry, practical considerations in specific fields of work including arts, crafts manufacturing, and service occupations, development of new opportunities in all fields of work and needed action by business, industry, unions, communities, and government agencies Information may be secured from Wilma Donahue, PhD Chairman, Division of Gerontology, University of Michigan, 1510 Rackham Bldg, Ann Arbor

NEW YORK

Personal—Dr Arthur J Bedell, Albany, recently returned from a lecture tour in Johannesburg and Cape Town in the Union of South Africa, Cairo, Egypt, and Athens, Greece—Dr Richard V Foster, Helmut has been appointed to fill the newly created post of assistant state commissioner of mental hygiene Dr Foster, who has been in state hospital service 20 years, was previously affiliated with Rockland State Hospital, Orangeburg, Grasslands Hospital, Valhalla, Pilgrim State Hospital, West Brentwood, and Central Islip State Hospital

Club Aids Speech Defectives—The James Sonnett Greene Club, a nonprofit organization affiliated with the National Hospital for Speech Disorders in New York City, has made available a teacher for underprivileged children with speech defects The club, which is named for the late Dr James Sonnett Greene, founder of the National Hospital for Speech Disorders, has 400 members in various parts of the world Most members were patients of Dr Greene, some as long as 30 years ago About 65% of the patients registered at the hospital receive free or clinic care A recent study disclosed that 32% of patients treated stuttered, 26% had articulatory disturbances, and 10% had voice disorders Thirty five per cent of the patients are children under 16

New York City

Griffis Medical Library Fund—Cornell University Medical College, New York, announces establishment of the \$75,000 Griffis Medical College Library Fund, income from which will be used to purchase books, periodicals, and other publications for the college. The fund is endowed by Mr Stanton Griffis of New York and members of his family. Mr Griffis is a Cornell graduate (1910), a trustee emeritus of the university, a former United States ambassador to Poland, Egypt, Argentina, and Spain, an investment banker, and a member of the Board of Managers of the Memorial Hospital in New York City.

Personal—Dr John B Grant, associate director of the division of medicine and public health of the Rockefeller Foundation, was recently awarded the Order of the Lion of Finland for his services in developing the health and welfare of Finland (1948-1951).—Dr Harold Brandaleone recently addressed the Southside Clinical Society in Oakdale, L I, on the "Management of Diabetes Mellitus".—The Valley Forge Heart Institute and Research Center, Fairview Village, Pa., presented the 1953 citation to Dr Albert S Hyman, director of medicine, New York City Hospital, for his research on the electrophysiology of the dying heart and his development of the artificial pacemaker for cardiac resuscitation.—Dr Ambrose P Merrill, superintendent of St Barnabas Hospital for Chronic Diseases, has been elected president of the Greater New York Hospital Association, and Dr Martin R Steinberg, director, Mount Sinai Hospital, has been named president elect.

Cobalt Cancer Weapon Installed.—A cobalt-60 rotation teletherapy unit, a deep therapy cancer weapon, was recently unveiled at Francis Delafield Hospital, 163rd St and Fort Washington Ave. According to the city department of hospitals, it required three years and about \$65,000 to construct the unit, which weighs 7 tons, and the irradiation of the cobalt within an atomic pile required a year for completion. Similar units now nearing completion are scheduled to be installed at the Memorial Center for Cancer and Allied Diseases, the Westminster Hospital in London, the University of Michigan Medical School, Ann Arbor, and several other hospitals and institutions. Speakers at the ceremony were Drs Marcus D Kogel, commissioner of hospitals, and Willard C Rappleye, dean of the faculty of medicine, Columbia University. Dr Maurice Lenz, director of the radiotherapy service at Francis Delafield Hospital, presided.

OHIO

Medical Stamp Exhibit—The third Medical Stamp Exhibit, cosponsored by the Cleveland Health Museum and the Garfield-Perry Stamp Club of Cleveland, will be held July 11-27 at the museum.

Institute of Mental Health—The sixth annual Summer Institute on Mental Health was recently held in Dayton under the sponsorship of the Dayton State Hospital. Dr Joseph A Mendelson, superintendent, discussed "The Functional Psychoses," "The Organic Disorders," and "Hospital Services for the Mentally Ill." Dr Clyde Simson, director, Dayton Guidance Center, presented "Problems of Infancy and Childhood" and "Prevention of Mental Illness." Dr Roger M Gove, superintendent, Columbus State School, spoke on "The Mental Deficiencies" and Dr Bernard M Kuhr, Upper Miami Valley Guidance Center, on "The Neuroses."

OKLAHOMA

Fifty Year Pins Awarded.—Fifty Year pins were recently presented to Dr Orra A. Pierson, Woodward, Dr William J Trainor, Tulsa, who retired May 1, and Dr Patrick H Mayginn, Tulsa, who retired in 1946, Dr Wallace Byrd, Coalgate, and Dr John B Clark, Coalgate, who also received a life membership certificate in the Oklahoma State Medical Association. Life membership certificates were presented also to Drs Clyde O Williams, McAlester; Dean W LeMaster, Purcell, Joseph E. Cochran, Byars, Robert D Cody,

Centrahoma, George M Davis Sr, Bixby, Richard R. Johnson, Sand Springs, Henry A Ellis, Kiowa, who has served as mayor of Pittsburg for 15 years, and Daniel L. Perry, Robert E Lee Rhodes, Loren C Presson, Thomas B Coulter, Silas Murray, and Silas S Mohrman, all of Tulsa.

University News.—Dr Bernard H Hall, staff psychiatrist at the Menninger Clinic at Topeka, Kan., recently delivered the annual Leroy H Long Memorial Lecture, "The Growing Pains of the Psychiatrist," under the sponsorship of Phi Beta Pi fraternity, at the University of Oklahoma School of Medicine, Oklahoma City.

OREGON

Society News—At the annual meeting of the North Pacific Society of Neurology and Psychiatry in Portland, Dr Gordon H Hutton, Vancouver, B C, was installed as president, Dr William Y Baker, Seattle, was chosen president elect, and Dr Robert A Coen, Portland, was reelected as secretary treasurer.

Gifts and Grants—The following gifts and grants have been accepted by the state board of higher education: \$47,736.97 from the Mrs Nina Bell estate for the benefit of the Doernbecher Memorial Hospital for Children, Portland, \$23,000 from the National Cancer Institute of the U S Public Health Service for a research project on leukemia, under the direction of Dr Edwin E Osgood, and \$7,652.14 from the estate of Ida May Manley of Portland for cancer research. A continuation grant of \$4,750 has been received from the American Cancer Society to support research by Dr Aaron B Lerner, and Dr John E Harris will direct research on metabolism of the lens and cornea of the eye that will be supported by an \$8,500 grant from the National Institute of Neurological Diseases and Blindness, U S P H S.

University News—Dr Kazuo Shizume, a 1946 graduate of Tokyo Imperial University Medical School and an instructor in internal medicine at that institution, is currently spending a year in the division of dermatology, University of Oregon Medical School, Portland, on a U S Government Rehabilitation of Japan fellowship and an American Cancer Society research grant.—Dr William C Pritchard, recently discharged from service in the Army, has been appointed clinical instructor in medicine at the University of Oregon Medical School, Portland.—Dr Daniel K. Billmeyer, resident in pediatrics, became Oregon's first exchange resident when he recently went to Tulane University of Louisiana School of Medicine, New Orleans, for six weeks, while Dr George Herring of Tulane visited the Oregon medical school.—The joint ways and means committee of the Oregon State Legislature has approved \$280,000 for construction of an administrative unit for the University of Oregon Medical School's Crippled Children's Division, to be located in Sam Jackson Park, Portland. For many years activities of the Crippled Children's Division, under the guidance of Dr Paul G Hafner, have been housed in an old building in downtown Portland. The new administrative unit is to be located near the University State Tuberculosis Hospital.

PENNSYLVANIA

Dr James Hardy Accepts Two Appointments—Dr James D Hardy, Cornell University Medical College, New York, has been appointed scientific director of the Aviation Medical Acceleration Laboratory of the Naval Air Development Center at Johnsville, Bucks County, and simultaneously, professor of physiology, University of Pennsylvania School of Medicine, Philadelphia. At the Johnsville laboratory, investigations are under way into the physiological stresses experienced by man under modern high speed flight conditions. In addition to laboratories for work in physiology, biophysics, biochemistry, radiobiology, animal surgery, gas analysis, pathology, and electronics, the unit utilizes a mammoth human centrifuge capable of reproducing artificially the conditions encountered by aircraft pilots in high altitudes. As professor of physiology at the University of Pennsylvania, Dr Hardy will teach in

both the medical school and the graduate school of Arts and Sciences. The university has provided the space and part of the personnel for a radiobiology laboratory where a scintillation counter has been modified to meet the need for a more efficient detector of radioactive substances and for a more accurate measurement of blood flow. Dr Hardy, who entered the Navy as lieutenant in the reserve in 1941, now holds the rank of captain in the reserve.

SOUTH DAKOTA

Society News—The Black Hills District Medical Society recently elected Dr Joseph N Hamm, Sturgis, president, Dr Arthur Semones, Lead, vice president, Dr Harold J Grau, Rapid City, secretary treasurer and Dr Gordon S Owen, Rapid City, censor.

Personal—Dr Frank W Haas has resigned as superintendent of Yankton State Hospital, after 25 years of service, to enter private practice in psychiatry.—Dr Walter L. Hard, professor of anatomy and former assistant dean, has been named dean of the University of South Dakota School of Medical Sciences, Vermillion.

TENNESSEE

Dr Hale Appointed Bacteriology Professor—Dr William M Hale, head, department of bacteriology and virology, Brookhaven National Laboratories, Long Island, N Y, has been appointed professor of bacteriology at the University of Tennessee Medical Units, Memphis. Dr Hale, who was formerly professor of bacteriology at the University of Iowa, Iowa City, and has served as a member of the National Board of Medical Examiners in charge of bacteriology, will continue as consultant to the Brookhaven laboratories.

TEXAS

State Medical Election—At its annual session in Houston, the Texas Medical Association elected the following officers: president, Dr George Turner, El Paso, president-elect, Dr Francis J L Blasingame, Wharton, vice president, Dr Andrew S Tomb, Victoria, secretary, Dr John M Travis, Jacksonville, and treasurer, Dr Thomas H Thomason, Fort Worth.

University News—Dr Alastair W B Cunningham of the University of Edinburgh has been appointed professor of pathology at the University of Texas Medical Branch, Galveston. He will be responsible for instruction and research on arthritis and diseases of the joints.—Dr Vernie A Stembridge, assistant professor of pathology at the University of Texas Medical Branch, Galveston, has been placed in charge of the cancer program of the medical branch. With Lieut Col Frank M Townsend, U S Air Force (MC), of Lackland Air Force Base, Dr Stembridge has prepared an index of 107,000 pathological diagnoses made at the John Sealy Hospital, Galveston, for statistical analysis.

WASHINGTON

Hospital News—Dr Jay I Durand was recently honored at a dinner for the staff of Children's Orthopedic Hospital, where he has served for 25 years as chief of the pediatric service. An oil portrait of Dr Durand was unveiled in the new building.

New Boeing Medical Headquarters—Dr Thrift G Hanks, medical director, Boeing Airplane Company, Seattle, has announced that the medical department has moved into new headquarters. The central medical department is operated in addition to 11 dispensaries maintained by the department in Boeing's Seattle and Renton plants. The department operates three ambulances and employs 57 persons.

Personal—Dr Reuben L. Larsen has been appointed coordinator of medical services for the Seattle civil defense organization.—Dr Otto T Trott, Seattle, recently received the Robert C Miller memorial award, given annually by the Northwest

Region Ski Patrol Association to its most outstanding member. Dr Trott was cited for his work in medical education for National Ski Patrol members and for his liaison work with the Mountain Rescue Council.

ALASKA

Organize Mental Health Society—A feature of Mental Health Week, the organizational meeting of the Juneau Mental Health Society, the first mental health society to be organized in the territory, was scheduled for May 7. Two informal pre-organization meetings were held while educational material and resources for use of the members were being accumulated.

HAWAII

Society News—At the annual meeting in Wailuku the Hawaii Territorial Medical Association elected the following officers from Honolulu: president, Dr Edwin K Chung Hoon, president-elect, Dr Nils P Larsen, secretary, Dr Samuel L Yee, and treasurer, Thomas H Richert.

Poliomyelitis Institute—A workshop institute in the care of poliomyelitis was conducted at Tripler General Hospital at Moanalua June 22-24 under the joint sponsorship of the District of Oahu Nurses Association, the Honolulu Chapter of the National Foundation for Infantile Paralysis, and the Hawaii Chapter, American Red Cross. The purpose of the institute was to strengthen the community in its ability to cope with any future poliomyelitis epidemic and to give interested nurses the opportunity to work with the latest equipment for the care of the disease.

Annual Health Report—The Department of Health, Territory of Hawaii, Honolulu, reports that in 1952 an all time low infant mortality of 21 per 1,000 live births was realized, 98% of all babies were born in hospitals, whereas 20 years ago only 10% were born in hospitals, 13% of all expectant mothers in the territory in 1952 attended preparatory classes. Syphilis declined about 40% in 1952 from the figure for the previous year, the total number of cases of tuberculosis reported was somewhat lower in 1952 than in the previous two years, and only 20% of the patients with known active cases were not hospitalized. A steady decline in the number of new cases of leprosy has been reported for the last four years.

GENERAL

Rome Surgeons Honor Americans—The Rome Surgical Society has conferred honorary fellowships on Drs Raymond W McNealy, Chicago, Charles P Bailey, Philadelphia, and Edgar F Berman, Baltimore.

New WMA Headquarters—According to a notice from Dr Louis H Bauer, secretary general, the World Medical Association and the United States Committee, Inc., have moved to new headquarters at 345 E 46th St., New York 17 (Telephone OXford 7 0090).

Publishers Appoint New Officers—Mr Robert S Gill has resigned after 11 years as president of the Williams & Wilkins Company, medical publishers of Baltimore. He becomes chairman of the board and is succeeded by Mr E F Williams as president. Mr Edward M Passano is executive vice president, and Mr V Robert Edwards becomes director of sales and advertising.

Teaching Affiliation—The New York Medical College, Flower and Fifth Avenue Hospitals, and the Kessler Institute for Rehabilitation in West Orange, N J, have reached an affiliation for teaching purposes. Dr Jerome S Tobis, director of the department of physical medicine and rehabilitation at the college, is a member of the consulting medical staff of the institute, and Dr Henry H Kessler, medical director of the institute, is a clinical professor of rehabilitation at the college.

Conference on Hormone Measurement—An international conference on methods of measuring steroid hormones was recently conducted under the auspices of the Laurentian Hormone Conference, at the Worcester Foundation for Experimental Biology, Shrewsbury, Mass., a nonprofit organization that conducts research. Expenses were paid from a grant by the National Science Foundation. Papers read at the sessions will be printed in a special volume of 'Recent Progress of Hormone Research,' official publication of the Laurentian Hormone Conference.

Medical Specialties Preference Test—According to the director of information of Stanford University, this test was developed by Edward K. Strong Jr., Ph.D., of Stanford University, and Col. Anthony C. Tucker, Ph.D., of the Army Medical Service Corps, after questioning more than 4,000 physicians and about 800 medical school seniors. It was financed by grants from the Surgeon General of the Army. The test results are intended not to show a man's ability or aptitude for a particular medical specialty but to reveal to what extent his interests agree with the interests of other successful men already practicing in that specialty.

Joseph A. Capps Prize—The Institute of Medicine of Chicago offers a biennial prize of \$600 for the most meritorious investigation in medicine or in the specialties of medicine. The investigation may be also in the fundamental sciences, provided the work has a definite bearing on some medical problem. Competition for 1953 is open to graduates of Chicago medical schools who completed their internship or one year of laboratory work in 1951 or thereafter. Manuscripts, which must be submitted to the Secretary of the Institute, 86 E. Randolph St., Chicago 1, not later than Dec. 31, become the property of the institute.

Award to Dr. Zilboorg—At its annual meeting in Los Angeles, the American Psychiatric Association presented to Dr. Gregory Zilboorg, associate clinical professor of psychiatry, New York Medical College Flower and Fifth Avenue Hospitals, and clinical associate professor, State University of New York College of Medicine at New York City, its \$1,000 Isaac Ray award for his contributions to legal problems connected with mental disorders. Dr. Zilboorg will deliver six lectures on "The Psychology of the Criminal Act and Punishment" at Yale University, New Haven, Conn., Oct. 14, 21, 28, and Nov. 4, 11, and 18, under the joint sponsorship of the law school and the school of medicine. The lectures will then be published. Dr. Zilboorg's contributions include "Legal Aspects of Psychiatry," which appeared in the book "One Hundred Years of American Psychiatry," published on the 100th anniversary of the founding of the American Psychiatric Association (1844-1944), "Mind, Medicine, and Men," and "History of Medical Psychology."

Tuberculosis Association Awards—At its annual meeting in Los Angeles the National Tuberculosis Association bestowed on Dr. James J. Waring, professor of medicine, emeritus, University of Colorado School of Medicine, Denver, the Trudeau medal for medical achievement in tuberculosis and on Dr. James R. Reuling, Bayside, N. Y., speaker of the A. M. A. House of Delegates, 1952-1953, the Will Ross medal for distinguished service in the tuberculosis movement in a field other than the medical sciences. Dr. Waring, who became a patient at the Trudeau Sanatorium at Saranac Lake, N. Y., while a student at Johns Hopkins University School of Medicine, Baltimore, continued his medical studies at the University of Colorado, where he subsequently served as professor of medicine from 1933 until 1952, when he became professor emeritus and president of the board of trustees and director of research of the Colorado Foundation for Research in Tuberculosis. Dr. Reuling was president of the National Tuberculosis Association for 1947-1948. He is consulting physician at Flushing Hospital, Triboro Hospital, Jamaica, N. Y., Rockaway Beach, and Long Beach Memorial hospitals, and clinical professor of medicine, New York Medical College, Flower and Fifth Avenue Hospitals. He served in the Medical Corps of the Navy from 1916 to 1920 and is a past president of the Queens County Medical Society.

Grants in Cancer Research—The Committee on Growth of the National Research Council, acting for the American Cancer Society, is accepting applications for grants in aid in support of cancer research. Applications for new grants received before Oct. 1 will be considered during the winter, and grants recommended at that time will become effective July 1, 1954. Investigators now receiving support will be notified individually regarding application for renewal of these grants. In addition to clinical investigations on cancer, the research program includes fundamental studies in the fields of cellular physiology, morphogenesis, genetics, virology, biochemistry, metabolism, nutrition, cytochemistry, physics, radiobiology, chemotherapy, endocrinology, and environmental cancer.

During the past year the American Cancer Society, on the recommendation of the Committee on Growth, has awarded about 250 grants totaling more than \$1,700,000. A program of similar magnitude is contemplated for the coming year. Application blanks and additional information may be obtained from the Executive Secretary, Committee on Growth, National Research Council, 2101 Constitution Ave., Washington 25, D. C.

Endocrinology Awards—At the annual dinner of the Endocrine Society in New York, May 29, the Squibb Institute for Medical Research award (a certificate and \$2,500) was presented to Dr. David Marine, Rehoboth Beach, Del., who was one of the first to demonstrate the correlation between endemic goiter and iodine deficiency in the diet. Dr. Marine, who began his work at Western Reserve University, Cleveland, resigned in 1920 to become director of the laboratory division of Montefiore Hospital for Chronic Diseases in New York, where he remained until his retirement in 1945.

For the first time the Ciba Award for distinguished research in endocrinology (\$1,800) was bestowed on a husband and wife team of scientists, Sidney Roberts, Ph.D., associate professor of physiological chemistry at the School of Medicine, University of California at Los Angeles, and his wife, Clara Marian Szego, Ph.D., assistant professor of zoology at the same university.

James Ashmore, who received his Ph.D. in biochemistry from St. Louis University School of Medicine, June 2, was awarded the Schering Fellowship in Endocrinology. He has worked under the direction of Dr. Edward A. Doisy, director of the department of biochemistry, on hormone metabolism. He plans to conduct his research on some aspects of intermediary carbohydrate metabolism in the Harvard Medical School, Boston, with Albert B. Hastings, Ph.D., professor of biological chemistry.

Academy of Sciences Announces Prize Contests—The following prize contests have been announced by the New York Academy of Sciences:

A. Cressy Morrison Prizes in Natural Science—Two prizes of \$300 each for the two most acceptable papers in a field of science covered by the academy or an affiliated society.

Boris Pregel Prize in the Field of Natural Radioactive Substances—A prize of \$500 for the most acceptable paper received in competition during the year 1953 embodying the results of research in the field of natural radioactive substances, including the precise determination of their physical and chemical properties and constants.

Wenner Gren Foundation Prize of the New York Academy of Sciences—A prize of \$1,000 for the best paper submitted on the general theme of the significance of the human factor in the advancement of science. It is the purpose of this award to stimulate cross-disciplinary thought, research, and writing on the influence of human cultural and social factors in the biological and physical sciences. All papers must embody the results of original research not previously published, must be typewritten in English, and must be accompanied by all necessary photographs, drawings, diagrams, and tables, and a summary of the data presented and conclusions reached. Papers must be submitted on or before Oct. 15 to the Executive Director of the New York Academy of Sciences, 2 E. Sixty Third St., New York 21. Awards will be made at the annual meeting in December.

Prevalence of Poliomyelitis.—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States, its territories, and possessions in the weeks ended as indicated

Area	June 20 1953		June 21 1952 Total

Safety Council Names Award Winners.—Connecticut and Evanston, Ill., have been named grand award winners in the 1952 National Traffic Safety Contest conducted by the National Safety Council in which 45 states and 750 cities participated. Cited in the honor roll section of the contest for going through 1952 without a traffic fatality were 647 municipalities with populations between 5,000 and 10,000. States that won first place in their divisions were Connecticut (eastern) in addition to winning the grand award, Virginia (southern), Iowa (midwestern), Colorado (western), and Pennsylvania among the eight largest states, which are grouped separately due to their peculiar traffic problems growing out of large population and mileage. Cities that won first

place in their population groups were Detroit (cities of more than 1 million population), Washington, D. C. (750,000 to 1 million), Buffalo (500,000 to 750,000), Kansas City, Mo. (350,000 to 500,000), Rochester, N. Y. (200,000 to 350,000), Wichita, Kan. (100,000 to 200,000), Evanston, Ill. (50,000 to 100,000) in addition to winning the grand award, Bloomington, Ind., Manitowoc, Wis., and Shaker Heights, Ohio (25,000 to 50,000), and Garden City, Kan., and Grosse Pointe Park, Mich. (10,000 to 25,000).

Blackwell Awards.—The Elizabeth Blackwell citations of New York Infirmary were recently presented at the Manhattan General Hospital, which is host to the infirmary while its new hospital is being built on Stuyvesant Square. Awards were made as follows:

(1) To Dr. Alice Hamilton Hadlyme Conn, the first woman appointed to the faculty of Harvard University where for 15 years as professor of industrial medicine in the medical school she trained many other leaders in that field. (2) To Dr. Josephine B. Neal, New York, who for many years was in charge of the division of acute infections of the central nervous system of the Department of Health of New York City. From 1936 until her retirement she took on the additional burden of associate director of laboratories of the health department. (3) To Dr. Ellen C. Potter, Trenton, N. J., as secretary of welfare of the state of Pennsylvania she was the first woman cabinet officer in any state. She subsequently became director of medicine department of institutions and agencies of New Jersey, president of the American Medical Women's Association, president of the National Conference of Social Work, and acting president of the Woman's Medical College of Pennsylvania. (4) To Dr. Florence R. Sabin, Denver, the first woman to hold a full professorship in Johns Hopkins University School of Medicine. For 13 years she was a member of the Rockefeller Institute for Medical Research. She subsequently became chairman of the board of health and hospitals in the city and county of Denver and manager of its department of health and charity. (5) To Dr. Ida S. Scudder, the granddaughter of America's first medical missionary and the daughter of a medical missionary who raised money for the establishment of a hospital at Vellore, India, and in addition established a tuberculosis sanatorium, a roadside dispensary service, and a medical school for women, now a government-approved school that has graduated hundreds of doctors and nurses.

Society News.—The American Otorhinologic Society for Plastic Surgery, Inc., recently elected Dr. Harry Neivert, New York, president, and Dr. Louis Joel Feit, New York, secretary. At its annual meeting the Western Society of Electroencephalography elected Dr. Eugene M. Webb, San Francisco, president, and Dr. Sylvester N. Berens, Seattle, secretary-treasurer. At the annual meeting in New York the Society for Investigative Dermatology elected Dr. Arthur C. Curtis, Ann Arbor, Mich., president, and Dr. Francis W. Lynch, St. Paul, vice president. At the annual meeting in St. Louis the American Urological Association elected Dr. J. A. Campbell Bolston, Baltimore, president, and chose Dr. W. Joseph McMartin, Omaha, as president-elect. At the annual meeting of the American Diabetes Association the following officers were elected: president, Dr. Randall G. Sprague, Rochester, Minn., vice presidents, Drs. Henry B. Mulholland, Charlottesville, Va., and Henry T. Ricketts, Chicago, secretary, Dr. John A. Reed, Washington, D. C., and treasurer, Dr. William H. Olmsted, St. Louis. At the annual meeting of the American Academy of Tuberculosis Physicians in New York, the following officers were elected: president, Ethan Allan Brown, Boston, vice presidents, Drs. Carl H. Gellenthien, Valmora, N. M., and Zoltan Galambos, Chicago, auditor-editor, Dr. Harry J. Corper, Denver, officer of sessions, Dr. Laurie Lee Allen, Milwaukee, historian, Dr. William E. Wakely, East Orange, N. J., and secretary, Dr. Oscar S. Levin, Denver. At the annual meeting in New York the American Board of Physical Medicine and Rehabilitation elected Dr. Robert L. Bennett, Warm Springs, Ga., as president, and Dr. Earl C. Elkins, Rochester, Minn., secretary-treasurer. Dr. William H. Schmidt, Philadelphia, was reelected vice-chairman. The California chapter of the American College of Chest Physicians has elected Dr. Alfred Goldman, Beverly Hills, president, Dr. William G. Winter, Fresno, vice president, and Dr. Walter B. Brown, Livermore, secretary-treasurer. The American Association of Friends and Families of Psychiatric Patients has elected as president Dr. George W. Henry, associate professor at Cornell University Medical College, New York, and as vice president Dr. Edward M. Shepard of the Cornell Medical College faculty.

FOREIGN

Foreign Journal on Genetics—The new quarterly, *Journal de Genetique Humaine*, published in Geneva, Switzerland, is said to be the first journal in French devoted to human genetics. The editors are Prof. A. Franceschetti, director of the University Ophthalmological Clinic, Geneva, Switzerland, Prof. L. Van Bogaert, director of the neuropathological department of the Institute Bunge, Antwerp, Belgium, and Maurice Lamy, professor of human genetics of the Medical Faculty, Paris, France. The journal is published by *Medecine et Hygiene*, 15, Boulevard des Philosophes, Geneva, Switzerland.

Gynecologic Meeting—The 43rd meeting of the Italian Society for Obstetrics and Gynecology will be held in Rome, in Palazzo Barberini, Sept. 21-24. The main subjects on the agenda are modern trends in gynecologic surgery and allergic phenomena in obstetrics and gynecology. Automatic translation apparatus for Italian, German, English, and French will be supplied. Participation in the congress is free to all members of Italian or foreign societies of obstetrics and gynecology. Otherwise the fee is 5,000 lira (approximately \$8). For information write to Prof. Piero Cattaneo, secretary-general, Clinica Ostetrica e Ginecologica del l'Università di Roma, Casella Postale Roma Nomentano 7171.

Medical Books for Korea—Four Korean medical schools will receive about \$7,500 worth of new medical books sent by the United Nations' Korean Reconstruction Agency through CARE. Part of \$150,000 worth of new text and reference books (exclusive of packing and transportation costs) that CARE is buying and shipping to war-depleted Korean universities for UNKRA, the medical volumes will represent 1,252 titles, of which 90% are American books, with the balance English, French, and German. UNKRA is purchasing additional Japanese titles in the medical and other book categories covered by the project, which will cost an over all total of \$200,000 and provide from 50,000 to 60,000 new books.

Meeting on Physical Therapy—The first International Congress of the World Confederation for Physical Therapy, which will be held in London, Sept. 6-11, has as its theme "The Patient's Own Activity as the Underlying Principle of Physical Therapy." Dr. Herman Kabat, Vallejo, Calif., will speak on "Proprioceptive Facilitation Therapy for Paralysis." Social events will include a reception in the Great Hall of the British Medical Association, an evening reception given by the Council of the Chartered Society of Physiotherapy at Guildhall, where the guests will be received by the Lord Mayor of London, and a cocktail party given by the trustees of the Ciba Foundation for the Promotion of International Cooperation in Medical and Chemical Research. Two study courses have been arranged to precede the congress (Sept. 2-4), when a three day course on diseases of the chest will be given at Brompton Hospital and Harefield Hospital, and a three day course on rehabilitation after amputation at Queen Mary's Hospital, Roehampton. Information may be obtained from the organizing secretary, Physical Therapy Exhibition, 55 Romney St., London, S W 1, England.

DEATHS IN OTHER COUNTRIES

Prof. Arturo Castiglioni died recently in Milan, Italy, aged 78. He had been research associate and lecturer in the history of medicine at Yale University, New Haven, Conn., from 1939 to 1943 and professor from 1943 to 1947. As a fellow of the New York Academy of Medicine he lectured before the Section on Historical and Cultural Medicine. In 1942 he was president of the New York Society for Medical History, and on his birthday April 12, 1944, was honored by his American colleagues at a dinner at the Waldorf-Astoria Hotel, New York. He made presentations at universities and medical societies throughout the country, and in 1933 was the Hideyo Noguchi Lecturer at Johns Hopkins University, Baltimore. He served as associate professor of the history of medicine at the University of Siena in 1921 and at the University of Padua from 1922 to 1938. For many years he was honorary

president of the Società Italiana di Storia delle Scienze Mediche e Naturali and in 1950 was honorary president of the Italian Group of the International Union of the History of Science. He was a prolific writer. His "History of Medicine," first published in Italian in 1927, appeared in three revised editions and was translated into six languages.

CORRECTION

Quinidine Therapy in Auricular Fibrillation—In the article on this subject by S. A. Weisman, in *THE JOURNAL*, June 6, page 496, figure 2 was reprinted from the *American Heart Journal*, not figure 1 as was stated in the article.

EXAMINATIONS
AND LICENSURE

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS *Parts I and II*. All centers where there are five or more candidates Sept. 8-10 (Part I only). Candidates may file applications at any time but the National Board must receive them at least six weeks before the date of the examination they wish to take. *Part III* June 9-26. Examination will be held in each of 31 centers having five or more eligible candidates. Exec. Sec., Dr. John P. Hubbard, 133 South 36th St. Philadelphia 4.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY *Written*. Various locations July 16. Final date for filing applications was January 17. Sec. Dr. C. B. Hickcox, 80 Seymour St. Hartford 15.

AMERICAN BOARD OF DERMATOLOGY AND SYPHILIGOLOGY. All candidates must now pass a written examination. *Written*. Various centers Sept. 3. *Oral*. Philadelphia Oct. 16-18. To be eligible candidate must complete 36 months of training before Oct. 1. Final date for filing applications was May 1. Exec. Sec., Miss Janet Newkirk, 66 East 66th St., New York 21.

AMERICAN BOARD OF INTERNAL MEDICINE *Oral*. San Francisco Sept. 30-Oct. 2. Chicago Nov. 30-Dec. 2. The closing date for acceptance of applications for the San Francisco and Chicago oral examination was April 1. *Written*, October 19. The closing date for acceptance of applications was May 1. Exec. Sec. Treas. Dr. William A. Werrell, 1 West Main St. Madison 3.

AMERICAN BOARD OF NEUROLOGICAL SURGERY *Oral*. New Haven, October. Final date for filing applications is July 1. Sec. Dr. Leonard T. Furlow. Washington University School of Medicine, Kingshighway and Euclid Ave. St. Louis.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY *Written*. Various cities of the United States and Canada Feb. 5. Application for examination or re-examination as well as requests for resubmission of case reports, must be made prior to October 1. Sec. Dr. Robert L. Faulkner, 2105 Adelbert Road, Cleveland 6.

AMERICAN BOARD OF OPHTHALMOLOGY. Chicago Oct. 5-9. *Written*. Various Centers. January 1954. Final date for filing applications is July 1. Sec. Dr. Edwin B. Dunphy, 56 Ivie Road, Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. Chicago January 1954. Final date for filing application is August 15. Sec. Dr. Harold A. Seefeld, 122 S. Michigan Ave. Chicago 3.

AMERICAN BOARD OF OTOLARYNGOLOGY *Oral*. Chicago Oct. 5-9. Sec. Dr. Dean M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PATHOLOGY *Written*. *Pathologic Anatomy and Clinical Pathology*. Chicago Oct. 8-10. Sec. Dr. William B. Wartman, 303 E. Chicago Ave. Chicago.

AMERICAN BOARD OF PEDIATRICS *Oral*. Ann Arbor June 26-27. Place undecided Oct. 9-11 (tentative), Indianapolis November. Exec. Sec. Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PLASTIC SURGERY *Entire Examination*. San Diego Oct. 29-31. Final date for receipt of case reports was June 1. *Entire Examination*. Galveston April 17-19. Final date for receipt of case reports is Jan. 1. Corres. Sec. Mrs. Estelle E. Hillerich, 4647 Pershing Ave. St. Louis 8.

AMERICAN BOARD OF PROCTOLOGY *Part II* *Oral and Written*. *Anorectal Surgery and Proctology*. Philadelphia Sept. 19. Sec. Dr. Louis A. Bule, 102-110 Second Ave. S.W. Rochester, Minn.

AMERICAN BOARD OF RADIOLOGY *Oral*. *Radiology*. *Röntgenology*. *Diagnostic Röntgenology* and *Therapeutic Radiology*. Chicago Dec. 6-11. Final date for filing application is July 1. Sec. Dr. B. R. Kirklin, 102-110 Second Ave. S.W. Rochester, Minn.

BOARD OF THORACIC SURGERY *Written*. Various centers throughout the country September 11. Final date for filing application is July 1. Sec. Dr. William M. Tuttle, 1151 Taylor Ave. Detroit 2.

DEATHS

Bachmeyer, Arthur Charles ☉ Loveland, Ohio, associate dean emeritus, Division of Biological Sciences, University of Chicago, and director emeritus of the university clinics, died at the Washington National Airport in Washington, D C, May 22, aged 66, of coronary occlusion. Dr Bachmeyer was born in Cincinnati Dec. 6, 1886. He received his doctor of medicine degree from the Medical Department of the University of Cincinnati in 1911. From 1911 to 1913 he served as intern and resident surgeon, as assistant, and later acting superintendent at the Cincinnati General Hospital. From 1914 to 1935 he was superintendent of the Cincinnati Tuberculosis Sanatorium and the Cincinnati General Hospital, from 1920 to 1935 professor of hospital administration, and from 1925 to 1934 dean at the University of Cincinnati College of Medicine. He was also affiliated with the Children's and Christian R. Holmes hospitals. At the University of Chicago, where he served as associate dean of the university's medical and biological division from 1935 until his retirement in 1951, Dr Bachmeyer served as director of the university's graduate program in hospital administration and as a member of the student selection committee of the medical school. He was also consultant to the university's 10 million dollar medical building program, including the Argonne Cancer Research Hospital, recently completed on the Midway campus by the Atomic Energy Commission. Since 1948 he had been vice-chairman of the Committee on Survey of Medical Education. Following his retirement from the university, he served as director of the commission on the financing of hospital care. During World War I he was a major in the medical officers reserve corps of the U S Army, and since 1919, had been a lieutenant colonel in the medical reserve corps. Dr Bachmeyer was a director of the board of the Chicago Blue Cross plan, and from 1946 treasurer of the American Medical Congress and the American Hospital Association, of which he was president in 1926. The 1950 recipient of the American Hospital Association award of merit, Dr Bachmeyer served as director of study of the Commission on Hospital Care, 1944-1946. He was a charter member and in 1940 president of the American College of Hospital Administrators, and in 1951 president of the Association of American Medical Colleges, of which he was treasurer for many years. He was a member of the Institute of Medicine of Chicago, American Public Health Association, American Association for the Advancement of Science, Chicago Hospital Council, Chicago Hospital Service Corporation, serving as a member of the board, and since 1948 on the medical advisory committee of National Security Resources Board, and was a member of Alpha Kappa Kappa and Alpha Omega Alpha. He was awarded the honorary doctor of science degree from the University of Cincinnati in 1935 and the University of Nebraska in 1949. Dr Bachmeyer was chairman of the editorial board of *Modern Hospital* and joint author of "The Hospital in Modern Society" (1943) and "Hospital Trends and Developments, 1940-1946" (1948).

Hayne, James Adams ☉ Congaree, S C, born in Baltimore, March 18 1872, Medical College of the State of South Carolina, Charleston, 1895, state health officer, and secretary of the South Carolina State Board of Health, from 1911 to 1944, when he retired to become public health education director for the department, served as collaborating epidemiologist for the U S Public Health Service, chairman of the Section on Preventive and Industrial Medicine and Public Health of the American Medical Association, 1919-1920, and member of its House of Delegates in 1921, past president of the Columbia Medical Society, South Carolina Medical Association, and the Conference of State and Provincial Health Authorities of North America, member of the American Public Health Association, of which he was executive secretary, formerly professor of public health administration at his alma mater, veteran of the Spanish American War, died May 11, aged 81, of chronic myocarditis.

DIED WHILE IN MILITARY SERVICE

Hull, Richard Barnett ⊕ Springfield, Ill., born in Zanesville, Ohio, March 14, 1921, Northwestern University Medical School, Chicago, 1946, interned at Evanston (Ill.) Hospital, reported for active duty on April 10, 1946, following his first duty assignment at the Naval Air Station, Grosse Ile, Mich., served at Naval Training Center, Great Lakes, Ill., as medical officer aboard the USS Manatee and at the Naval Hospital, Portsmouth, Va., released to inactive duty on Dec. 31, 1947, served a residency in internal medicine at the University of Chicago Clinics, Chicago, following this, became an associate staff member of the Memorial and St. John's hospitals, volunteered and was recalled to active duty in August, 1952, lieutenant M C, U S Naval Reserve, assigned to the USS Haven, hospital ship operating in Korean waters, died aboard the ship May 19, aged 32, of injuries received in a helicopter accident

GOVERNMENT SERVICES

ARMY

Ten Postgraduate Short Courses—A series of 10 short post graduate courses will be conducted for Army Medical Corps officers during the fiscal year 1953-1954. They also are open to a number of qualified civilian physicians. The courses are designed to help medical officers in outlying installations keep abreast of recent medical advances. The courses, listed according to the place where they will be given, are as follows: Brooke Army Medical Center, clinical laboratory course (March 15-19, 1954), Fitzsimons Army Hospital, symposium on pulmonary diseases (Sept 21-25, 1953) and clinical electrocardiography and recent advances in cardiovascular diseases (Nov 9-14, 1953), Letterman Army Hospital, rehabilitation techniques in neuromuscular diseases and disabilities (April 5-10, 1954), Armed Forces Institute of Pathology, forensic pathology (Nov 2-6, 1953) and pathology of the oral regions (March 8-12, 1954), and Walter Reed Army Medical Center, seminar in urology (Sept 7-9, 1953), symposium on circulation and homeostasis (Oct 5-9, 1953), symposium on physical and mental health standards (April 16-17, 1954), and recent advances in medicine and surgery, including psychosomatic aspects of medicine and surgery (April 19-30, 1954).

Physicians who are board-certified or board-qualified, chiefs or assistant chiefs of services at hospitals, and officers well advanced in the study of their specialty are eligible to attend any of the courses. Officers partially qualified in the specialty, officers with a special interest in the specialty, ward officers, and dispensary surgeons responsible for medical treatment in this specialty are eligible to attend the courses at Brooke Army Medical Center, Fitzsimons Army Hospital, the Armed Forces Institute of Pathology, and the symposium on circulation and homeostasis at Walter Reed Army Medical Center.

Applications for any course must be submitted at least six weeks prior to the opening date. Army medical officers on active duty and full-time Civil Service physicians at Army installations should forward their applications through channels to the Surgeon General, Department of the Army, Washington 25, D C, Attention Personnel Division. Officers having second priority (not on active duty) should forward their applications through channels to the Army Area Commander to whose jurisdiction they are assigned. National Guard medical officers should apply under current National Guard regulations, forwarding their applications to the National Guard Bureau, Washington 25, D C. Physicians from other federal agencies and other civilian physicians are advised to forward their applications to the commander of the hospital or installation conducting the course. In submitting requests for admission applicants should indicate (1) their name, rank, service number, and primary and secondary MOS (military occupational specialty), (2) organization and station, (3) title of course desired, (4) list of all other courses attended during the past two years with dates of each, and (6) category and expiration date.

Medical Books for Korea—On Sept 6, 1952, Brig Gen (then Colonel) L. Holmes Ginn Jr, Eighth Army Surgeon, appealed to THE JOURNAL for donations of medical books and journals to be used in renewing the library of war ravaged Severance Hospital and Medical School in Seoul, Korea. In conjunction with this appeal, medical personnel in the Eighth Army contributed to a Severance Hospital fund to cover costs of transportation. The response to this appeal has been generous. More than 10,000 books and journals have been received from persons, organizations, and publishers, and the library has been restored to usefulness. However, contributions continue to arrive and the need remains urgent.

Severance Hospital, Seoul's leading medical center, maintains one of six medical schools in Korea. Operating with extremely limited facilities, they are training over 100 future

physicians as well as providing essential civilian medical care. In observance of the center's 69th anniversary, May 15, the hospital newspaper expressed the deep gratitude of the students and the Korean people to General Ginn and the United Nations medical personnel in Korea for their help in obtaining badly needed books and supplies.

Personal.—Capt Robert H. Felix of Chicago has been cited by the U S Army Forces, Far East, for the Army's Commendation Ribbon in recognition of his research into the effects of epidemic hemorrhagic fever encountered in Korea.

PUBLIC HEALTH SERVICE

Dining Car Sanitation.—On June 3 the Erie Railroad received a special citation as the first major railroad whose dining cars have all been awarded the Certificate of Sanitation under the cooperative inspection program between the railroads and Public Health Service. To achieve the certificate a dining car must rate at least 95% on an inspection conducted by a P H S dining-car inspector. The inspection is based on a check of 128 separate items, involving both basic construction of the car (particularly the kitchen and the pantry) and maintenance of sanitation. Several years ago, in cooperation with representatives of the railroads, the Public Health Service established a set of high standards for dining-car sanitation. All railroads operating dining cars have been working toward meeting these specifications. Each individual dining car that does so receives the Certificate of Sanitation.

Treatment Centers for Emotionally Disturbed Children.—The Children's Bureau of the Federal Security Agency (now the Department of Health, Education, and Welfare) recently issued a directory entitled "Residential Treatment Centers for Emotionally Disturbed Children," which is said to be the first directory of its type published in the United States. The 78 page booklet lists 36 agencies for children who cannot be helped in their own or foster family homes or in the usual institutions. New York State has eight, Illinois, six, Ohio, four, Michigan, Mississippi, Kansas, Minnesota, and Washington, two each, and New Jersey, Maine, California, Maryland, Pennsylvania, Connecticut, Rhode Island, and Virginia, one each.

Dr Johansen Retires.—After 29 years of service at the National Leprosarium at Carville, La., Dr Frederick A. Johansen retired on June 1. This 450 bed U S Public Health Service hospital is the only institution in continental United States devoted exclusively to the care and treatment of patients with Hansen's disease, and Dr Johansen has guided installation and organization of the hospital's rehabilitation services and community activities. He is a diplomate of the American Board of Preventive Medicine and Public Health. His successor is Dr Eddie M. Gordon, a native of New Orleans, who comes to Carville from Chicago, where he has been in charge of the local U S Public Health Service hospital. Dr Gordon joined the Public Health Service after graduating from Tulane University School of Medicine in 1927.

VETERANS ADMINISTRATION

Personal.—Dr Sandor Rado, clinical professor of psychiatry and director of the Psychoanalytic Clinic for Training and Research at Columbia University, conducted a seminar on the differential diagnosis of schizophrenia, psychoneurosis, and personality disorders for the members of the hospital staff of the VA Hospital, Northport, Long Island, N Y, on May 21, 1953.

FOREIGN LETTERS

CHILE

Congress on Rheumatic Diseases.—The first Chilean Congress on Rheumatic Diseases was held in the Termas de Pami mavida on Nov 28-29, 1952. About 70 rheumatologists, internists, orthopedic surgeons, endocrinologists, neurosurgeons, neurologists, and psychiatrists were present, as well as the Minister of Health, Dr Waldemar Coutts, and other medical administrative authorities.

Painful Shoulder.—C J Meredith and C Lackington discussed "Medical Aspects of Painful Shoulder," reporting 160 cases, with a critical review of the literature. They distinguished three forms: (a) secondary or surgical forms such as that due to fracture, (b) a symptomatic form which is present in many cases of rheumatoid arthritis and in some cases of gout and spondyloarthritis, and (c) idiopathic forms, representing 8.5% of all cases seen in an arthritis clinic. They stress the importance of metabolic changes that probably underlie the onset of the syndrome of a painful shoulder. These patients are particularly subject to fibrositis and osteoarthritis as well as low back pain and sciatica. On this basis, plus the histological changes observed in the soft tissues, they suggest that painful shoulder may be tentatively classified as a collagen disease. They formulate some possible objections to this hypothesis, such as the frequent association of painful shoulder with diabetes (9.4% in this series) and with diseases of the chest (notably pulmonary tuberculosis). The pathogenic mechanisms involved are complex and imperfectly understood. They deprecate the attempt, on clinical grounds, to formulate precise anatomical diagnoses such as capsulitis or tendinitis. The literature suggests in any case a lack of exact correlation between the anatomic changes and the clinical picture, and anatomic names create confusion in a syndrome whose clinical and evolutionary aspects are essentially constant.

Zeldis and Cerda reported 57 cases of painful shoulder due to local nonarticular causes, which were analyzed as follows: The diagnosis was frozen shoulder in 25 cases, bicipital tenosynovitis in 12, supraspinous tenosynovitis in 16, and incomplete rupture of the supraspinous tendon in 1. The cause was not diagnosed in three cases.

Achurra and Lake reported 52 cases of painful shoulder considered from the surgical point of view in which the causes were diagnosed as follows: acute subdeltoid bursitis in one case, tuberculous subdeltoid bursitis in one, bicipital tendinitis in two, periarthritis in six and osteoarthritis in one. The cause was not diagnosed in seven cases.

Lozada and Zanartu reported six cases of the shoulder hand syndrome as described by Stenbrocker. Stellate ganglion block was tried in three cases, with indifferent effects on mobility although a decrease in pain was observed. The authors feel that this treatment is indicated only in stage 1 of the process. Later cortisone was administered in four cases in initial doses of 100 to 300 mg intramuscularly daily, the doses were rapidly decreased to 75, 50, or 35 mg and given for two to three months. This treatment together with kinesotherapy was uniformly successful in all cases, although untoward side-effects appeared in some (including depression, insomnia, palpitations, and moon face) until administration of the hormone was discontinued.

Discussion of the papers on painful shoulder was presided over by an Argentine guest, Dr Guido Costa Bertani, president of the Argentinean Society of Rheumatological studies, who summarized the comments.

Vitamin B₁₂ in Arthrosis.—Dr Oscar Melendez and associates studied the action of vitamin B₁₂ in 32 patients with arthrosis who were from 42 to 73 years old. The patients re-

ceived intramuscular injections of 100 µg per week of vitamin B₁₂, with a maximum of five doses. Good results were obtained in 21 cases, fair results in 6, and no response in 5. In 28 cases a marked improvement in general well being was observed. The majority of the patients who benefited from the therapy were in good condition after one month of observation.

Psychogenic Rheumatism.—The psychogenic factors that influence rheumatism were studied by Dr A Arcaya. A total of 43 cases of rheumatoid arthritis were studied in the psychiatric department of the Van Buren Hospital. The author found strong evidence to support the idea that the appearance of acute disease was often associated with psychogenic factors. Study of the personality of such patients is important, and good psychotherapy will do much for them.

Frontoparietal Radiation.—Prof M Hermosilla and L Corona and associates read a paper on "Irradiation of the Frontoparietal Zone in Rheumatoid Arthritis." They studied 16 patients and observed improvement in the majority. The authors' explanation is that in these patients modifications of the vegetative mechanisms of the diencephalon affect the articular process by neuroendocrine mechanisms.

Scleroderma.—Dr R Tellez and co-workers discussed a study on scleroderma. Dr Tellez is inclined to believe that a predisposition to scleroderma is characterized by a neurotrophic imbalance due to alterations of the vegetative mechanisms of the diencephalon. Anoxia, which is secondary to chronic arteriolar vasoconstriction, increases the alkalinity of the interstitial fluid and causes, among other things, calcinosis. To neutralize the alkalinity, the authors administered ammonium chloride and corticotropin (ACTH) to inhibit secretion of mucolytic enzymes and testosterone, which increases the cholinergic tonus and helps to maintain potassium in the cells. This therapeutic scheme was applied in three cases of advanced and generalized scleroderma. Improvement was maintained in all cases during 1½ years of observation.

Lower Back Pain and Sciatica.—Dr Oke France and colleagues studied 100 patients with lower back pain and sciatica who were hospitalized in general medical wards. They classified the patients into two groups, group 1 included those without symptoms or signs of spinal damage (25 cases) and group 2 those with spinal lesions (75 cases). In 15 cases in the latter group the cause of the syndrome of lower back pain with sciatica could not be found, in 31 cases there was herniation of the nucleus pulposus, in 7 cases herniation of the nucleus pulposus was probably present, in 3 cases there was metastatic neoplasm, in 1 case meningoradiculitis was present, in 4 cases there was spondyloarthritis, and in 1 case there was an extradural lipoma.

Cortisone and ACTH in Arthritis.—Dr M Losada and associates analyzed the results obtained with cortisone and corticotropin (ACTH) in 62 patients with rheumatoid arthritis and reached the following conclusions: 1 Cortisone and corticotropin suppress in variable degree the signs of activity of rheumatoid arthritis. This effect can be maintained as long as the drug is administered. The drugs do not cure the disease. 2 These drugs act on the clinical, biochemical, and histological alterations of the disease but not on the etiological agents. 3 These drugs are the most important ones in the treatment of the disease, but they are not essential in every case. 4 Up to the present moment the authors consider that the best treatment for rheumatoid arthritis is gold salts. They consider that cortisone and corticotropin can be used under the following conditions when there is a contraindication to the use of gold salts or deep radiotherapy, when the latter therapy is inefficient, to increase the tolerance for gold salts, for the treatment of toxic reactions to gold therapy, and as treatment preceding orthopedic maneuvers.

FINLAND

Care of Alcoholics—At a recent meeting of the Finnish Medical Society (Finska Lakarsällskapet) a report on the results of the therapy of alcoholics in Finland was followed by a discussion of recent experiences in this field. In his report on the subject, Dr O Leineberg reviewed the achievements of a polyclinic started in 1947 in Vasa for the benefit of alcoholics requiring outpatient therapy. During the five year period 1947-1951, as many as 533 male alcoholics were studied and treated. They came within the category of alcoholics as defined by the Allan Memorial Institute in the United States, and it was primarily for their alcoholism and not for any remote effect of it that they were treated in this polyclinic. Among the 533 alcoholics were 191 in whom a positive result was achieved, 21 of them becoming total abstainers and the remainder curtailing their drinking habits to an appreciable extent. There remained 342 alcoholics (64.2%) for whom a negative result had to be admitted. Dr Leineberg pointed out how misleading it is to base studies of the therapy of alcoholics solely on the achievements of closed institutions, for about 90% of alcoholics requiring therapy receive it as outpatients, and it is an outpatient therapy that they must usually depend on. It is also a fallacy, in his opinion, to gage the effect of therapy according to whether it does or does not lead to complete abstinence. The man who again becomes a useful member of society in spite of occasional lapses from sobriety may have achieved this success as the result of the therapy he has received, but he is apt to be omitted from consideration in temperance campaigns. Dr Leineberg referred to the activities of an association, corresponding to Alcoholics Anonymous, with 40 members who help each other in Vasa. In this connection great care is taken in choosing a fellow member to be responsible for the personal welfare of each alcoholic. While they were members of this body, these 40 men lost only 162 working days because of alcoholism, whereas as many as 1,042 working days were lost for the same reason over the same length of time before they joined this body.

At the same meeting there was a discussion of the merits of disulfiram (Antabuse) therapy whose value is limited by the fact that close supervision is essential to its success. Another drawback to disulfiram is that its effects last only six hours. Alcoholics persuaded by a wife or employer to take disulfiram are likelier to desert it than when they have taken it on their own initiative. At one time alcoholics could be confronted with the alternatives of disulfiram therapy or hospital internment, but of late the former has lost some of its effectiveness from the discovery, now common knowledge with some alcoholics, that a 0.2% solution of aromatic tincture of iron counteracts the effects of disulfiram. It was evident from the discussion at this meeting that growing interest is now being taken by the medical profession in various aspects of alcoholism.

Tapeworm Pernicious Anemia—At the University Maria Hospital in Helsingfors, Prof Bertel von Bonsdorff has undertaken far-reaching studies of tapeworm pernicious anemia in the past 15 years. During this period much has been added to textbook knowledge of this disease, and this is largely to the credit of von Bonsdorff, who has surveyed recent observations and theories on this subject in *Nordisk medicin* for May 1, 1953. Though tapeworm pernicious anemia is hematologically identical with cryptogenetic pernicious anemia, and the two give rise to the same neurological manifestations, it is only the former that attacks young persons (von Bonsdorff's youngest patients were 11 years old) and it can be associated with free hydrochloric acid and Castle's intrinsic factor in the gastric juice. It has also been found that control of the anemia can be effected by expelling the worm and by giving liver or stomach preparations orally or by injecting liver extract. The same effect can be obtained by giving folic acid orally or parenterally.

Observations have led von Bonsdorff to suspect that the tapeworm must be alive to act as a toxic agent. The live tapeworm may be able to inhibit the secretion of intrinsic factor or may consume intrinsic or extrinsic factor. In other

words, the live tapeworm may compete with its host in absorbing vitamin B₁₂ and possibly some other hematopoietic substances. The subjects of pernicious anemia, whether it is due to the tapeworm or is cryptogenetic, may be constitutionally predisposed to both diseases. In certain persons in whom tapeworm anemia has been cured in youth by expulsion of the worm, cryptogenetic anemia develops in old age. There are also families in which several cases of both forms of anemia occur. In either case a constitutional predisposition may determine faulty excretion of intrinsic factor. In several of von Bonsdorff's patients in whom tapeworm anemia was cured by the expulsion of the worm, tapeworm anemia has developed again when the patient is reinfected with the worm. On the other hand, in many of his patients who recovered from tapeworm anemia after expulsion of the worm, pernicious anemia did not develop on reinfection and subsequently cryptogenetic pernicious anemia did not develop. These and many other observations have led von Bonsdorff to believe that tapeworm pernicious anemia depends on what he calls a constellation of the following circumstances. The tapeworm must be alive in the intestinal tract where it absorbs vitamin B₁₂ and possibly other substances essential to blood formation in its host. Tapeworm pernicious anemia is promoted by an inadequate supply of extrinsic factor and/or diminished production of intrinsic factor. To be effective, the constellation of circumstances necessary to the creation of this form of anemia must be operative over a considerable period.

MEXICO

Use of Vitamins in Severe Malnutrition in Children—One of the conditions that has been carefully studied in the nutrition ward of the Children's Hospital (Hospital Infantil) of Mexico City is that of advanced malnutrition. These studies have been directed by Dr Federico Gómez and collaborators, and during the last two years approximately 200 cases have been observed. The manifestations of advanced malnutrition include extreme emaciation, marked edema, xerosis, extensive pellagrous lesions of the skin, subclinical scurvy, hypoproteinemia, and those signs that have classically been attributed to ariboflavinosis.

Treatment has consisted in an adequately balanced diet that is sufficient in caloric value as well as in vitamin content without the addition of commercial vitamin products. Dr Gómez and his collaborators have found, to their surprise, that in cases of uncomplicated malnutrition that is not extreme, complete cures are obtained in a reasonable period of time, with disappearance of the signs that have been considered to be due to vitamin deficiencies and that, according to foreign authors, require the use of large amounts of vitamins, in the form of commercial preparations, for their treatment.

In cases of extreme degrees of malnutrition or when there is superimposed infection, the clinical course is different. In the first type of case, when the emaciation is severe, the cellular damage appears to be irreversible, with loss of the capacity of the tissues to utilize nutritive substances. Gómez and associates have called these conditions "tissular agony," as they systematically lead to death. In the presence of infections, which are ordinarily gastrointestinal or respiratory, the clinical course is frequently unfavorable, although not necessarily fatal. Correction of the nutritional alterations, if they are reversible, is slower and more difficult.

Reorganization of Department of Public Health and Welfare—On the day of his inauguration (Dec. 1, 1952), President Ruiz Cortinez appointed Dr Ignacio Morones-Prieto as Secretary of Public Health and Welfare and Dr Manuel Pesqueira as Undersecretary. Dr Morones-Prieto had already been under secretary of this department in the first months of President Aleman's administration, later he was governor of the state of Nuevo Leon. He is a distinguished physician who for many years practiced medicine in the city of San Luis Potosi, where he was twice rector (president) of the university.

Dr Pesqueira is a urologist who, besides maintaining his private practice, is a member of the staff of the urology service in the General Hospital, Mexico City. It is expected that he

will be in charge of the technical aspects of the reorganization of the Department of Public Health and Welfare. The reorganization involves selection of personnel, review of programs, and study of the sanitary and welfare problems of the country.

Among the new administrative measures were the creation of two new subdepartments, one for the control of foods and beverages and the other for maternal and infant care. The medical care of farmers was also emphasized. A campaign against poliomyelitis was added to the already existing national campaigns against tuberculosis and malaria.

Dr Donato Alarcón, one of the outstanding Mexican specialists in tuberculosis, was chosen to direct the national campaign against tuberculosis. Because of his long experience, it is believed that the achievements of this campaign will continue.

The campaign against malaria is of particular importance in Mexico, as it is known that 7% of the general population is affected in some form or another by this disease. For a better coordination of this campaign, the country has been divided into 10 zones. The fight against malaria consists of destruction of the carrier of the *Plasmodium* parasites and treatment of the patients with active forms of the disease. For the first purpose the Department of Public Health and Welfare will work with the Department of Water Resources in order to drain swamps polluted by *Anopheles* mosquitoes. Where drainage is not feasible, the swamps will be sprinkled with a mixture of petroleum and DDT. Regarding the therapeutic aspects, the Department of Public Health and Welfare will establish special laboratories to process quinine obtained from the plantations that were started 10 years ago in the state of Chiapas. It is expected that the quinine so acquired not only will suffice to provide for the malaria campaign (in which it is planned to distribute quinine free to persons with inadequate economic resources) but will provide a surplus for export.

The new national campaign against poliomyelitis has as its principal aim this year the administration of gamma globulin to children between 6 months and 5 years of age, when the epidemiologists estimate that the 1953 outbreak of the disease is progressing towards its peak. To procure the necessary amounts of gamma globulin, the Department of Public Health and Welfare has given wide publicity to requests among the general population for 50,000 liters of blood. In order to facilitate its collection, most of the hospitals and health centers of Mexico City have organized sections with the necessary means for that purpose. The second aim of the campaign against poliomyelitis is the care of the children in whom paralysis develops. Two special institutions have been planned for this purpose besides the already existing facilities of the Children's Hospital.

SWEDEN

Prognosis for Bundle Branch Block.—In the Vasa Hospital in Gothenburg, Dr Bengt Lundh made an analytical study of 100 consecutive cases of bundle branch block observed in the 10 year period 1942-1951. During this period about 18,500 patients were treated in the hospital. Thus, 0.5% of these patients represented cases of bundle branch block. This condition was observed in 3% of the some 3,300 patients undergoing electrocardiography. The ratio of 61 men to 39 women was an underestimate of the comparative liability of men to suffer from this condition as the female patients in the hospital during this period outnumbered the male patients by 25%. The mean age for both sexes at the time of the diagnosis of this condition was 73.1 years. There were only 10 cases (all ending fatally within a year) of right sided bundle branch block, the remaining 90 being cases of left sided block. All the five patients with Wilson's block were dead within a year. Altogether 46 patients died within a year of the diagnosis, the mean duration of life in this group being only three months after the diagnosis. The duration of survival for all 100 patients after the diagnosis was a mean of two and five tenths years, and it was four years for the patients surviving the first year. There were 15 patients who lived five years or more and three who lived more than 10 years after the diagnosis. In as many

as 77 cases, the bundle branch block was traced to hypertension or coronary disease or a combination of the two. All the 66 patients examined post mortem showed marked coronary sclerosis, and 8 of them showed enlargement of the heart. Dr Lundh, whose study was published in *Nordisk medicin* for April 24, 1953, concludes that the prognosis in such cases depends on the basal disease from which the patient is suffering and that it is not justifiable to indulge in a pessimistic prognosis hinging only on a bundle branch block, which by itself is not necessarily incompatible with a long life and a certain physical activity. It would seem that this condition is not rare and in many cases causes no obvious disability.

Frequency and Treatment of Incontinence of Urine.—A recent statistical investigation carried out in the course of three weeks at the Vasa Hospital in Gothenburg by Dr Per Westerberg has shown how distressingly common incontinence of urine is among old persons. The six analytical tables and two charts, which he published in *Nordisk medicin* for April 10, 1953, dealt with 319 hospital patients, of whom 102 suffered from incontinence of urine and 64 from incontinence of urine and feces. The incontinence rate was much the same for men as for women, but, while for men the ratio of slight and sporadic incontinence to daily incontinence was 4 to 31, the corresponding ratio for women was 24 to 43. In other words, slight and intermittent incontinence was much commoner in women than in men. Again, in the oldest age group, incontinence was three times as common among women as among men. This may be so because women live longer than men or possibly because old incontinent women live longer than old incontinent men. The high rate of incontinence in this study may largely be accounted for by the fact that about 90% of these patients suffered from functional or somatic disturbances of the central nervous system. Among the 102 incontinent patients were 17 suffering from senile dementia and cerebral arteriosclerosis and 32 from universal arteriosclerosis. There were also 21 hemiplegic patients, but paralysis agitans accounted for only 2 cases and syphilis for only 3. Infection of the urine was so common in men that the ratio of those with infected to those with sterile urine was 6 to 1. The corresponding ratio for women was 2 to 1. Some temporary relief of incontinence was effected by urinary disinfectants, but a fortnight later urine was again found to be infected.

In regard to treatment, Dr Westerberg insists that the first and most urgent step is to get the patient out of bed and to prevent his return to it for good. Much can also be done by exercise therapy and by training the patient and stimulating him to retain or recover control of the bladder. Dr Westerberg refers briefly and unenthusiastically to treatment with such drugs as ephedrine and belladonna.

Criticism of Popular Health Education.—In *Svenska läkartidningen* for April 17, 1953, Dr Erik Engelfeldt of Stockholm stated that education of the public in matters of health should be conducted with a serious sense of responsibility. To illustrate his point, he recorded cases demonstrating the virtues and vices, respectively, of popular health education. His first case, illustrative in a negative sense of the virtues of such education, was that of a man, aged 50, admitted to hospital suffering from myocardial infarction. He had been lifting a heavy barrow load of earth when he suddenly experienced violent precordial pain. He continued to work, although the pain was excruciating. His death in a hospital a few days after his admission to it might have been averted had popular health education taught him to note such symptoms. Dr Engelfeldt's second case, illustrative in a positive sense of the vices of popular health education, was that of a boy, aged 19, suffering from myeloblastic leukemia, the nature of which he did not understand, although his parents knew what this diagnosis implied. One day the son confronted the parents in much distress with the exclamation "You need not deceive me any longer. I have read in the newspapers today about blood cancer, and this must be what I am suffering from." Dr Engelfeldt sees no reason to disturb the public with information about diseases for which a cure is unknown.

CORRESPONDENCE

WORCESTER CHEST X RAY SURVEY

To the Editor—The Worcester, Mass., chest x-ray survey was the 22nd of its kind conducted with the cooperation of the United States Public Health Service. The main object of these surveys has been to obtain roentgenograms of the entire population over the age of 15 years during a period of 5 years. This objective has not been reached, although the program is now in its eighth year. This type of survey is a service to the person of whom a film is made and to the persons close to him, but it is not an effective method for bringing a costly disease under control.

Our program was completed in September, 1952, and our statistics as of Dec. 3, 1952. The work required 3,000 volunteer workers of all classifications and professions. It is estimated that they supplied more than 300,000 hours of work, which, if paid at a minimal wage scale level, would have cost at least \$300,000. The literature shows that no effort has been made to make the over-all costs of such surveys known. Based on the figures of the U S P H S and the money obtained locally, the actual cost of our survey was approximately \$150,000, a cost of \$1.00 for each person who received a 70 mm film. If the costs of volunteer service are added, the costs rise to \$3.00 per film. When broken down, these figures show that the cost for each positive case of tuberculosis found up to Dec. 3, 1952, amounts to approximately \$3,000. When the cost of the time contributed by the volunteers is added, the cost per case found is \$9,000. If these same figures are used, the cost for each suspicious case discovered by the survey amounts to \$3,000. These costs do not seem justified when they are spent for control of a disease that is steadily declining because of many nonmedical contributing factors, such as better living and working conditions, shorter working hours, more and relatively less costly foods, and the general increase of health knowledge.

Our survey was unusual when compared with programs in other areas. For unexplained reasons, ours was the first conducted without the usual, preliminary community survey. A preliminary survey would have shown that there was no need for this program, that there was a low tuberculosis incidence in the area, and that Worcester was a comparatively healthy city. All of this the medical profession already knew. Our medical committee feels that local medical societies should initiate these programs, not public health officers or other voluntary health agencies. If this practice were followed, the medical profession would not be forced into a compromising position, and there would be a better relationship among all organizations concerned. Previous local experience made us cautious, and we agreed to participate in this survey only with the understanding that it would be a fact-finding community project. The result was that for the first time in the survey of 22 areas, a local medical society assumed the major role in the development and control of the policies of the program.

After assuming this leadership, the medical committee, with the approval of the general executive committee, took upon itself the management of the major portion of the survey. Some of the important actions and rules by which the medical committee conducted this program were as follows: 1. This was to be a fact-finding survey, and no diagnosis was to be made or implied. 2. The survey had two primary purposes, first, to find new cases and rediscover old cases of tuberculosis and, second, to refer persons in whom findings were positive or suggestive to a physician or clinic of their choice. 3. A medical information pamphlet should be published to acquaint all members of the medical society and of allied medical groups with the purposes and objectives of the survey. 4. The program was to provide all persons over the age of 15 years an opportunity to have a chest film. 5. Basic criteria for the recall of all suspicious findings were established, and the criteria for the interpretation of the chest films were drawn. 6. Under the medical executive committee, five medical review panels were set up. The members of these panels were

all members of the district medical society. The film review panel was the greatest contribution made to date by any medical society in any similar survey. It consisted of all the radiologists of the medical society. These radiologists volunteered and read all 14 by 17 in films taken in the survey. The other review panels were the cancer review panel, heart review panel, medical and surgical review panel, and the scoliosis review panel. The scoliosis review panel brought into this type of a survey a new and interesting study of a large number of scoliosis patients who would otherwise be hard to find. It is hoped that some conclusion on the relationship of scoliosis to diseases of the chest, if any, may be reached. 7. A flow chart was devised for the management and disposition of all persons filmed and a list of physicians who would be available to those patients not having a regular physician was made available. 8. The use of the word "free," was eliminated from the distributed literature and from the local press. The same word was painted off the mobile units. 9. Through a legal contract with the U S P H S, full control was obtained of all facts, figures, and statistics developed by the survey. These actions plus many others resulted in a program that had few problems in comparison to those of other areas surveyed, and our figures show that it was a successful program.

A summary of the facts and figures developed from our survey shows the following findings:

	Number	%
1 Estimated eligible adults	158,979	
2 70 mm films taken	153,510	
3 Eligible population filmed		96.0
4 Satisfactory 70 mm films read	159,260	99.2
5 Unsatisfactory 70 mm films read	1,250	0.8
6 Essentially negative findings in 70 mm films	146,997	96.5
7 Possibly abnormal findings in 70 mm films	5,263	3.5
8 Persons suspected of having		
Tuberculosis	2,699	1.7
Cardiovascular disease	402	0.3
Neoplasm	74	0.6
Other chest disease	1,292	0.9
Scoliosis	896	0.6
9 Recalled to retake center because of chest diseases	3,259	100.0
10 Total responding to retake center	2,904	89.1
11 Total failing to respond	355	10.9
12 Of the 355 who failed to respond		
220 or 61.9% went to private physician		
42 or 11.8% went to hospital or clinic		
61 or 17.1% lived out of survey area		
32 or 9.2% unable to locate or come		
13 Cardiovascular cases recalled	344	100.0
14 Total responding	262	79.0
15 Scoliosis cases recalled	896	100.0
16 Total responding	689	77.0
17 Satisfactory 14 by 17 in films taken	3,165	100.0
18 Essentially negative findings in 14 by 17 in films	419	13.2
19 Evidence of old healed disease on 14 by 17 in films	790	22.8
20 Referred for study from 14 by 17 in film findings	2,026	64.0
Of the 2,026 referred for study		
1,019 were suspected of having tuberculosis		
98 were suspected of having cardiovascular disease		
247 were suspected of having neoplasm or tumors		
602 were suspected of having other chest diseases		
21 Total referred to private physicians or clinics	2,580	100.0
A Referred to physicians	2,330	90.3
Reported to physicians	2,161	92.7
Disposition still pending	169	7.3
B Referred to hospitals or clinics	250	9.7
Reported to clinics or hospitals	230	92.0
Disposition still pending	20	8.0
C Summary of referrals		
Total	2,580	100.0
Under supervision	2,331	92.3
Cases closed (12-3-52)	1,690	65.5
Disposition still pending	189	7.3
22 Previously unknown cases of cardiovascular disease discovered	13	0.1
23 Total suspected tuberculosis cases referred by survey	1,209	
New cases found by survey active	50	
New cases found by survey inactive	67	

Since the beginning of the survey, 26 patients were admitted to Belmont Hospital for either diagnosis or treatment. As of Feb 1, 1953, only eight patients are still hospitalized. No change in the hospital census has resulted because of the survey findings to date.

The success of this program is hard to evaluate. Whether the success should be based on the number of new cases discovered or on the value of the medical education brought into a community by this type of a program depends on the reasons for which this type of a survey was first established. To the average person who is found normal, there will always be a question as to its worth. To the person in whom is discovered tuberculosis in an advanced stage or a lung tumor that is amenable to operation, the value of the program becomes extremely worth while and no cost would be too large.

Our program was a successful one for many reasons. Some new cases of tuberculosis were found, and some forgotten ones were rediscovered. An average number of lung and chest tumors were found, and some persons will be greatly benefited. The survey made possible evaluation of the health of our community. The largest health program ever attempted in our community was conducted successfully. Of the persons eligible for chest films in the area included in the survey, 153,510 (97%) were contacted. The number of persons included in the survey surpassed the original goal of 125,000 by 28,510, a goal percentage of 122.8. Our success was the result of good community spirit and full participation.

The value of continuing these surveys in other areas is questionable. It would seem that if statistics were the prime motive of these surveys then they have been obtained. If, on the other hand, eradication of tuberculosis was the prime motive, it is doubtful that these surveys can do a better job than they have already proved is being done by local and voluntary health agencies.

The exorbitant costs of these surveys cannot be justified by the number of new cases discovered. It would be more valid, at this time, to justify the cost by the number of new cases of cancer of the lung or chest that are discovered, a small number of which will be cured. These thousands of dollars could be put to better use if spent for the care of already known cases of tuberculosis.

RESUSCITATION OF NEWBORN INFANTS

To the Editor—In *THE JOURNAL*, May 16, 1953, there is an article "Resuscitation of the Asphyxiated Newborn Infant." The first sentence reads, "It is generally agreed that responsibility for resuscitation of the newborn infant belongs to the anesthesiologist." May I ask, agreed by whom? Surely obstetricians have not agreed on this. Would the authors of the article have the anesthesiologist, who is keeping the mother asleep with an inhalation anesthetic, stop administering the anesthetic and resuscitate the baby for the obstetrician, or would they perhaps recommend that there be two anesthesiologists available in every delivery room, one to care for the mother and the other for the baby? Anesthesiologists (at least some) are not the only ones who consider it their prerogative to resuscitate newborn infants. The officials of the Chicago health department are of the firm opinion that a pediatrician should be in the labor room at the time of every delivery to care for the baby immediately after birth. Surely obstetricians are as well trained in the care of newborn babies during the first hours after birth as pediatricians are. Furthermore, I would like to know how many pediatricians would be willing to be called out at any hour of the day or night to stand around in the labor room with nothing to do in the majority of cases.

May I point out that for a long time obstetricians have successfully resuscitated newborn babies with or without a tracheal catheter and without complicated instruments. It would be ideal indeed if we could have the same anesthetic care

for maternity patients that all other types of surgical patients receive. Not only mortality and morbidity rates in mothers would be reduced but fewer babies would require resuscitation. I hope the day will soon come when obstetric patients will have the services of well-trained anesthesiologists. Regardless of this, however, the physician who delivers the baby must know how to resuscitate it when necessary.

In copying some of their data from Little and Tovell's excellent review of asphyxia of the newborn (*Collective Review: The Physiological Basis for Resuscitation of the Newborn*, *Internat Abstr Surg* 86:417-428, 1948, in *Surg Gynec & Obst*, May, 1948), the authors made a slight error. They say, "The incidence of asphyxia increases markedly if the mother has passed the age of 35 to 40 years." Actually what Little and Tovell said was "The age of the mother is of no importance until the age of 40 is reached but that thereafter the incidence of asphyxia increases markedly." There are many women between the ages of 35 and 40 who have babies who are not in much greater jeopardy from asphyxia than are the infants of younger mothers. The authors also say, "In anoxia caused by cerebral injury to the fetus, the main injunction is the avoidance of trauma, particularly in such operative deliveries as midforceps, which carries a 30% mortality." I wonder where this fact came from. There is no doubt that midforceps deliveries are often traumatic, but surely the technique is not traumatic enough to kill almost every third baby. In fact, in *THE JOURNAL* (146:1465 [Aug 18] 1951), Weinberg reported a series of 1,000 midforceps operations with an uncorrected fetal mortality of 0.6%. This is an exceptionally low fetal death rate, but to say that 30% of babies die from midforceps operation is fantastic and untrue.

IDIOPATHIC ADRENAL APOPLEXY

To the Editor—The interesting case report by Ralph C. Greene on spontaneous idiopathic bilateral adrenal apoplexy associated with hypertension in *THE JOURNAL*, May 9, 1953, page 133, deserves comment. The 52-year-old man, with hypertension, nephrosclerosis, and renal insufficiency, had received considerable amounts of corticotropin (ACTH) for generalized "arthritic" aches and pains. He died seven days after hospitalization. I do not think that treatment with corticotropin was indicated. There was no evidence of arthritis of any kind, and the complaints of the patient fit the clinical picture I described as "hypertensive polyalgia" (*Differential Diagnosis of Internal Diseases*, New York, Grune & Stratton, Inc., 1950, p 188). I believe that treatment with corticotropin was contraindicated and that bilateral adrenal apoplexy could result from the administration of large doses of corticotropin to a person with arteriolar damage and hypertension.

HUGH OWEN THOMAS

To the Editor—I am writing a biography of Hugh Owen Thomas and also a revised edition of his works. I am anxious to gain access to unpublished material relating to any aspect of Thomas' private and professional life and to the history of his family. Thomas' association with American orthopedic surgeons is well known and was described by Dr. Winnett Orr in his book published a few years ago. I would be grateful for the opportunity of studying any papers in private ownership and will handle them carefully and will return them as soon as possible.

MISCELLANY

NOTE ON MILITARY MEDICINE

Alan Gregg, M D, New York

The rosters of all military medical services at present show a disturbing ratio between career men and civilians on relatively short turns of duty, a ratio in which the number of career men is already too small for the optimum utilization of the services of either group. Since the percentage of doctors of medicine on full time or part time salaries is increasing, and since, therefore, the various characteristics of medical careers are receiving attention from an increasing number of prospective aspirants for salaried positions, some of the elements of medical careers deserve review. This assertion carries additional weight because the falling purchasing power of the dollar has disturbed what used to be a stable factor in the calculations that could be made about any type of medical career. Some reflections on what, generically, will be called military medical careers seem to be in order.

From the range of motivations that apparently influence the choice of a career, it is evident that some young men choose their careers for reasons that are little affected by anything other than radical deterioration of salary, tenure, and terms of retirement. Such motivation is comparable to that which a psychiatrist calls a fixation. Such preferences often date from childhood and are fortified by family tradition and approval. These decisions do not deserve the onus of being called irrational and are free of the charge of being calculating. A young university president, who confided to his predecessor that the salary was pretty low, received from the president emeritus, who had loved the job, a broad but nonetheless applicable reminder, "But remember that better men than you are working as hard for less money." For some men, admittedly, the choice of career is but little influenced by the salary or the attendant circumstances. They want that particular career regardless. I think that this group is small and that it is at one end of a spectrum balanced at the other end by those who, without any fixation, are not only disposed and prepared to drive a hard bargain but also skeptical and realistic in their insistence on selling their services only to the highest and most dependable bidder. Obviously, between these two extremes fall a large number of persons who are, in the choice of their career, sensitive to changes that might be made in the terms offered. Indeed, it is only from this intermediate group that one could expect any appreciable increase in numbers as a result of increasing the attractions of a military medical career.

CHOICE OF A CAREER

In the choice of a career, several considerations are important: the presumed qualitative nature of the career itself and of its attendant circumstances, the variety and magnitude of the measurable or quantifiable rewards, the dependability of the terms offered, the extent to which the choice is irrevocable or the rapidity with which it becomes irreversible, and the number, reliability, and attractiveness (both qualitative and quantitative) of alternate careers.

The medical school graduate today enters a profession that is not overcrowded, he enters a seller's market. His services are in demand. His is the profession that averages the highest professional income in the United States, \$11,300 for an average of 58 hours of work per week. The variety of activities open to the possessor of the degree of doctor of medicine belies the casual assumption that a physician is just a physician. The variety of opportunity is evident from the widely variant requirements and rewards in medical careers, such as teaching, research, hospital administration, writing and editing, public health, industrial medicine, psychiatry, obstetrics, pediatrics, general practice, surgery and its specialties, and internal medicine and its subdivisions. In most of these careers alternative to military medicine, the beginner feels that the judges of his performance will be numerous (his patients) and, thus, dependably responsive, in the aggregate, to his capacities and

his efforts. He also feels that he is free to choose whether he will be self-employed or on salary and that he can easily change, if he pleases, his type of work, where he will live, and the form of his remuneration without uncontrollable loss of progress, competence, or prestige. To the more self-confident there appears no arbitrary limit, in private practice, to the quality or quantity of the recompense he can earn. To those who set great store by individual liberty, there is no boss who demands submission. Thus, the young physician considering a military medical career has, at present, many choices that offer attractions other than high financial returns.

The same attractions influence the decision to become a full-time teacher of medicine, and their cogency shows in the fact that full-time university salaries in the clinical fields are, with but few, if any, exceptions, higher than full-time teachers' salaries in any other faculty of the university. A competent clinician can augment this university salary by seeing private patients, without devoting thereto any conspicuous part of his "full" time. A professor of medicine at a state university, who had been teaching 58 hours a week (full time), was granted by the Regents the opportunity to see private patients 4 hours a week at the university hospital. In these 4 hours, he earned as much as the university paid him for the other 54 hours. That illustrates the discrepancy between private and public sources of income not familiar to most laymen and not frequently understandable even if it is known. It casts some light, however, on the difference in the scale of salaries paid for employed physicians and the financial rewards of private practice.

Aside from the military medical career, there are several careers that are varied, well paid, and not notably difficult to change or leave. Many of them allow an apparent independence and a stability that may be depended on when that independence is of the successful variety. Indeed, most civilian alternatives to a career in military medicine offer as their chief attractions those that appeal to the restless, the optimistic, the self-confident, the adventurous, and the extreme individualist. Let us hope they have the qualities of their defects; for private practice can also be conducted so as to make scant appeal to the socially minded, the conscientious, the undemanding, the self-critical, and the cautious.

By so much as military medical careers are made or encouraged to differ from civilian careers, the types of men attracted and retained by each will differ one from the other, and attempts at working together will produce friction and futility. It seems to me only common sense to realize that, until medical schools redress the imbalance in their entrance criteria that at present appear to favor scholastic records over evidence of unselfishness, conscientiousness, and the other character traits that keep society together, there will not be enough physicians to staff the military medical services. Why?

Military medical services seem to be operating at a sharp disadvantage because of conditions that could be remedied. What business or other form of human association could function smoothly with a complete turnover of two-thirds of the staff every two years? What psychological easement can be expected if 15 civilians are each forced to partly waste 2 years because conditions of service are not attractive enough to hold one man for 30 efficient years? Civilian medical organizations would be smarter to help make careers in the armed services oftener attractive to some, and, thereby, less often compulsory for the rest. As long as neglect and distrust are the treatment expected in a branch of the service that is as misunderstood as it is honorable and as honorable as it is important, the civilian medical profession will continue to pity itself for being in a situation that it could do more to remedy than anyone else. More civilians should speak up in behalf of the military, if they do not want to be drafted.

DISADVANTAGES OF MILITARY MEDICINE

What are the disadvantages of the military medical services regarded as a career? Before the nature of that career and its concomitants are discussed, two general defects must be mentioned. The first is that Congress can and on occasion has changed the terms of service with such finality and definite authority that these terms cannot be regarded as having the actionable character of those of a civil contract. It should be pointed out that changes in national and international politics

underlie the unpredictable character of the terms of service. This fact, however, does not lessen the handicap it puts on the nature of a military career. Such exigencies have been met with admirable patience and unselfish patriotism by career men in the medical services. Realistic estimation of the results of broken promises should result in an effort to mend the situation by some more practical measures than mere denial of their existence or belittlement of their harm. They have occurred. They do hurt. And they may happen again.

The other general defect of military medical service is not so much the initial finality of entering the service as the rapidity with which administrative routine relegates medical knowledge and skill to the sphere of forgotten things and makes the choice of a military career an irreversible decision. By so much as the permanent staff are outnumbered by temporary men from civilian life, administrative duties for the permanent men are likely to increase at the expense of their professional contacts, reading, and work. Much has already been done to preserve professional alertness, but continuing support for such measures is needed—the courage to pay the cost thereof. Again, a solution would be much easier if the number and ratio of career medical officers were larger.

Among the circumstances attendant on a military medical career and apart from salary, tenure, and retirement, housing in many stations is mediocre, the real cost of changing stations is not covered in full by the service allowances, the uncertainty of being able to put down roots in any community proves frustrating to some men and their wives, and education of children, even if it is easy and good, is also subject to unpredictable interruption. In instances in which the freedom to resign or retire has been sacrificed, the sense of a loss of personal independence intensifies itself, and the frustration that may result is capable of taking both varied and destructive outlets. Sampson was neither the first nor the last strong man to bring a temple down as a result of outrage and resentment, cynicism and apathy result from frustration in less combative spirits.

Such unfavorable circumstances often affect as strongly or more strongly the wives of medical officers than the men. Various reverberatory phenomena ensue that increase neither the contentment of either spouse nor their combined efficiency.

In addition to increases of salary and pension, there are only a few measures that are likely to increase the attractiveness of a military medical career. These are better housing or housing allowances, more generous arrangements for moving costs, more freedom to resign or retire at will, and maintenance of the present gains in opportunities for special professional training at all costs. It does not seem that increasing the salaries in only the lower or in only the upper ranks will accomplish desirable results. Surely it is folly to overlook the peculiar and, perhaps, inherent uncertainties of military service or the necessity of making up for that grave handicap. For, to the willing, eager, and contented productivity of a group of human beings, it is a handicap to live in uncertainty.

ADVANTAGES OF MILITARY MEDICINE

Military medical service is not without advantages. Programs of professional training are in force and are productive. The opportunities for personal growth and recognition are increasing, particularly in certain special spheres, such as submarine physiology and tropical or arctic medicine. In February, 1953, the American Medical Association recognized aviation medicine as a distinct specialty and authorized properly qualified persons to be Board certified. The aviation medicine group became affiliated with the former American Board of Preventive Medicine and Public Health, which changed its name to the American Board of Preventive Medicine. This Board will conduct separate examinations and issue separate certificates to those qualifying in aviation medicine on the one hand and public health on the other.

Military medicine eliminates the chance and even the occasion for mercenary or competitive exploitation of patients. The military community offers opportunities for friendships and social life just as pleasant as in civilian life. Salaries at least are dependable and calculable, as is income on retirement. Personal and family medical care is prompt and certain. There are no bad debts of patients. Promotion, though it should never be automatic or regardless of merit, receives more

criticism for being uncertain, slow, and arbitrary than it would if the pay at all levels compared more favorably with average civilian incomes. The real value of retirement pay depends at present all too precariously on the value of money, but so does the nest egg of a civilian. The civilian, however, can and will, if the present inflation continues, continue to work until he dies, a grim privilege, but a real one sometimes.

SUMMARY AND CONCLUSIONS

Several points seem worth emphasis. As long as the conditions and rewards of military medical service present sharp and unrelieved contrasts to those of civilian medical life, the recruitment of permanent career men in the armed medical services will be small and the peculiar defects of military medical careers will continue if not, indeed, increase. This situation will increase and aggravate the demands made on civilian physicians. It seems both fair and wise to redress any possible injustice and, more important, to face with plain realism and to remedy all possible factors that contribute to the tension, frustration, and discontent that characterize both sides of a very uneven partnership in American medicine.

BUREAU OF LEGAL MEDICINE AND LEGISLATION

MEDICOLEGAL ABSTRACTS

Medical Practice Acts: Disciplinary Action Following Conviction of Contempt of Congress.—This was a proceeding to review disciplinary action taken against the plaintiff physicians. From a judgment against them, the physicians appealed to the supreme court, appellate division, third department, New York.

The plaintiffs are physicians who were convicted in the U S District Court of the District of Columbia for contempt of Congress for refusal to produce certain records before a congressional committee. That offense is a misdemeanor, and therefore a crime. Their conviction was affirmed by the Court of Appeals for the District of Columbia, and certiorari was twice denied by the Supreme Court. Subsequently, the Board of Regents of the State of New York made a determination as to each petitioner in disciplinary proceedings, which this proceeding, under Article 78 of the Civil Practice Act, seeks to annul. The Board of Regents acted under Section 6514, subdivision 2(b), of the Education Law, which authorizes discretionary disciplinary action against a licensed physician who "has been convicted in a court of competent jurisdiction, either within or without this state, of a crime." The physicians interpret this language to mean that the "crime," wherever committed, must be one constituting a crime within the purview of the laws of the state of New York. They urge that there is no such crime as contempt of Congress in this state.

When the legislature used the words "within or without the state," it presumably meant what it said. There is no ambiguity in that language. Had the legislature meant a crime "without the state," which would constitute a crime within this state, it would have said so, as it has in other instances. The physicians also argued that the crime of which they were convicted bears no relation to the practice of medicine and involves no moral turpitude. The conviction for any crime, said the court, bears some relation to the practice of any profession, and moral turpitude depends on a point of view and existing circumstances. Presumably, and by its language, the legislature intended the Board of Regents to determine those questions and exercise its discretion. The legal history of the trial, conviction, and appeals conclusively establishes that petitioners were convicted by a "court of competent jurisdiction" and we think the Board of Regents acted within its lawful authority in making these determinations. Accordingly, the disciplinary action against the plaintiff physicians was confirmed. *Miller v Board of Regents of University of New York, Auslander v Board of Regents of University of State of New York*, 111 N.Y.S. (2d) 393 (New York, 1952).

THE LEISURE CORNER

No man is really happy or safe without a hobby, and it makes precious little difference what the outside interest may be—botany, beetles or butterflies, roses tulips or irises, fishing mountaineering or antiquities—anything will do so long as he straddles a hobby and rides it hard

—Sir William Osler

One cannot practice medicine alone, and practice it early and late as so many of us have to do, and hope to escape the malign influences of a routine life. The incessant concentration of thought upon one subject however interesting tethers a man's mind in a narrow field. The physician needs a clear head and a kind heart; his work is arduous and complex, requiring the exercise of the very highest faculties of the mind, while constantly appealing to the emotions and finer feelings

—Sir William Osler

Although many physicians have hobbies for the reasons given by Osler many years ago, there are several other explanations to account for the vast number of medical hobbyists extant today. First, most hobbies have generally started out as pure, unadulterated fun, frequently providing opportunities for the expression of creative ability unrealized in daily medical practice. A couple of centuries ago the English had a name for a horse that could be ridden over every terrain in all kinds of weather. They called it a "hobby." The nag was immensely popular precisely because it was at once enjoyable, serviceable, and easy to ride. To be sure, not all hobbies are easy to ride, but the choice is there for all sorts of persons to make, and is governed only by pocketbooks, tastes, and moods.

While it has never been established with certainty why a physician does not have a hobby, it is somewhat easier to say why he does have one. Some physicians' hobbies are harnessed to the needs of their daily work, for others, the further afield they go from the scene of their daily task the more content they are astride their hobbyhorses. Each hobby carries the rider into the fraternity of its followers and forges a solid link with persons who might otherwise never become acquaintances or friends because of the barriers thrown up by circumstances, occupation, or geographical location. Indeed, the same curiosity and creative impulse often motivate the surgeon and the newsboy on the corner when it comes to model trains, each feeling a bond of kinship for the other because of a mutual interest. The manner and speed in which this is accomplished depends as much on the goal of the medical hobbyist as on his inclinations and temperament.

Hobbies also furnish a more or less artificial way for mastering an entire sphere of activity from beginning to end. It is possible, of course, to lavish as much planning, research, and flights of the imagination on a hobby as one wishes, and the devoted hobbyist can study and investigate as many facets and ramifications of his field of interest as he desires. He does most of the spadework himself, and this, too, provides more than escape from a humdrum existence. The more deeply engrossed the hobbyist becomes the more satisfying the appearance of the vistas and horizons that loom ahead and the more acute the realization that the goal of perfection among hobbies, as in the case of the practice of medicine, is desirable but unattainable. Yet the excitement of the ever present challenge remains.

The names of many excellent physicians would have faded from the memory of the generation to which they belonged had not literature or some other chosen hobby or recreation conferred on them lasting renown, overshadowing and almost obliterating the fact that initially they were members of the medical profession. It is to literature that many physicians have turned, using such time in the beginning of their literary labors as was available away from medical practice. Undoubtedly, it is the experience of the physician, who is in constant, close contact with every phase of life and the nuances

of human nature, that has enabled him to succeed in so many instances as an author. Such literary figures as W. Somerset Maugham, A. J. Cronin, A. Conan Doyle, Arthur Schnitzler, Eugène Sue, Anton Chekhov, William Carlos Williams, Francis Brett Young, Joseph Hergesheimer, and A. S. M. Hutchinson, to name an important few, have demonstrated what medical men can do in terms of the novel. Were Samuel Coleridge, John Keats, and Johann Wolfgang Goethe to be addressed as "Doctor," most persons, including physicians, would be astonished to learn that these famous poets were once so designated. Yet, medical men they were, each one of them.

Some of the physicians who made important contributions to medicine have also been noted for their musical accomplishments; they usually became proficient performers on musical instruments or composers at the expense of what little leisure time was available away from medical practice. The Viennese physician Leopold Auenbrugger, discoverer of percussion of the chest, apparently developed an interest in that art as a result of listening to his innkeeper father thump away at wine casks for the purpose of measuring their alcoholic content. Later, Auenbrugger became court physician to Maria Theresa and wrote the libretto for the opera "The Chimney Sweep." One of the outstanding teachers of his time, Hermann Boerhaave, was perhaps the first physician to cultivate the playing of chamber music at his home, while Edward Jenner, discoverer of vaccination against smallpox, played both the violin and the flute. Caspar Bartholin, after whom the glands are named, wrote authoritatively about the double flutes of Greece, from which the oboe, the English horn, and the clarinet developed.

Perhaps the outstanding figure in medicine in relation to music is that of Hermann von Helmholtz. He not only practiced medicine, played several musical instruments, and was a distinguished connoisseur and critic of music but also wrote an exhaustive treatise on the physiological basis of tonal sensations. Like Helmholtz, Theodor Billroth, the pioneer of visceral surgery, was intensely interested in music and was an excellent pianist. Billroth was an intimate friend of the composer Brahms, and for many years the musical soirees at his home were famous. It was at Billroth's home that almost all of Brahms' chamber music was performed before being presented to the musical public. Still other physicians who made notable contributions to music were Alexander Borodin, composer of the opera "Prince Igor" and many symphonies, whose greatest compositions were written during the busiest period of his medical career, and Albert Schweitzer, who became the world's foremost exponent of the organ music of J. S. Bach. It is not surprising that few physicians have attained top rank in the field of music, yet it is a fact that thousands of physicians have enjoyed and cherished music as a hobby or avocation.

Physicians have for centuries been interested in painting, sculpture, and, more recently, in photography. Several of the early anatomists made their own drawings—Eustachio in the 16th century, Sylvius in the 17th, and Camp in the 18th century. During the Renaissance, medicine and art were inseparable. The greatest artists of their day were also great anatomists, notably Leonardo da Vinci, Michelangelo, and Raphael. They, and others like Vesalius, initiated scientific dissections, and their records of their observations gave medicine and surgery a tremendous impetus. During the 19th century, Pasteur and Charcot busied themselves with pastels and other aspects of art.

For the physician who complains that he cannot draw a straight line but would like to join the growing ranks of "Sunday painters," the eminent pediatrician the late Dr. A. Graeme Mitchell had these encouraging words of advice: "Everyone should produce in his avocation as well as in his vocation. He needn't take this too seriously and excite himself to professional ambition but he should carve, mold, draw, paint, or etch. I confess to this type of weakness. I am no artist and I admit it. Since I draw with a paltry pencil, paint with a scurvy brush and etch with an atrocious needle, I admit also to belonging to the ultra modern school and I prove it because my productions are distorted, far from understandable, and resemble nothing in Nature made by God or man."

They can be hung upside down, put in attic or basement, be in strong light or weak, face the wall or boldly back against it, and in all these situations be pleasing and strikingly modern."

Not all physicians are omnivorous readers or Sunday painters, yet their spirit for research and for the fascination of medical science make them indefatigable and insatiable when once the collecting fever seizes them, be it the collection of stamps, coins, paintings, beer mugs, model boats, or any of a hundred other things. It is for physicians as a group that some of the forthcoming articles on hobbies to be published in *THE JOURNAL* will be directed, and these will serve as an introduction and an invitation to the joys of hobbies rather than as a manual of detailed instruction. Although probably not everyone who would like to read about stamps would also be interested in model boats, or photography, or chess it is hoped that the Leisure Corner will offer a varied diet among hobbies, appealing to diverse tastes and inclinations.

MEDICAL MOTION PICTURES

NEW FILM ADDED TO A M A MOTION PICTURE LIBRARY

Infectious Hazards of Bacteriological Techniques: Part I. The Inoculating Needle 16 mm. black and white sound, showing time 10 minutes. Produced in 1951 by the Communicable Disease Center Chamblee Ga. Procurable on loan (service charge \$1) from Committee on Medical Motion Pictures, American Medical Association 535 N Dearborn St. Chicago 10

This film shows a series of experiments designed to determine whether or not bacterial aerosols are produced during the performance of many accepted bacteriological procedures even when the greatest precautions are taken. The technician uses *Serratia indica* as the culture and detects aerosols of this culture by means of seven sieve type air samples, each containing an agar culture plate and taking in 1 cu ft of air per minute from the working area. The experiments show that even in such common procedures as shaking liquid cultures, transferring cultures bubbling or mixing with a pipette, and blending, bacterial aerosols are produced that may infect the technician. Ways of lessening the dangers are also presented.

Didactically, the film is very satisfactory. It must be realized, however, that this is just one source of infection. The photography and narration are very well done. This film should be seen by everybody doing bacteriological work, including the young student of bacteriology in the medical school, the young student of medical technology, and also public health workers. It probably should be shown at regular intervals to remind these persons that they have to be constantly on the lookout, because they are handling materials dangerous to themselves and to others. It should also be shown to clinical pathologists as well as to pathologists in general, with the realization that a similar source of infection prevails not only in the pathology laboratory but in the autopsy room and in the laboratory of surgical pathology.

Reconstruction of the Esophagus by Jejunal Transplant 16 mm. color sound, showing time 31 minutes. Prepared by Ross Robertson M.D. and T. R. Sarjeant, M.D. Vancouver British Columbia. Produced in 1951 by and procurable on loan from Davis & Geck, Inc. 57 Willoughby St. Brooklyn 1

This film portrays one stage of a two stage operation in which a supposedly operable carcinoma of the esophagus is primarily bypassed by a jejunal transplant associated with an esophagojejunostomy. In this stage a segment of jejunum is thoroughly mobilized, but its arterial supply is maintained by the preservation of specific vessels which form the mesenteric arcade. Following the division of the jejunum, it is mobilized and placed through the mediastinum and delivered into the neck. The cervical phase of the operation has been conducted by another team, so that the upper esophageal segment is

visible and prepared for anastomosis. An additional anastomosis, intra abdominally reestablishes intestinal continuity. The author states that if the lesion is resectable, the involved segment is removed at a second operation, however, the determining factors that decide resectability were not evaluated. The illustration that shows the operation of Yudin is lost to the viewer because of the smallness of the diagram, the lack of detail, and the want of color. Since practically all of these patients are poor risk cases because of inanition one would appreciate some statement as to the preoperative preparation of this heroic procedure. The meticulous dissection that is required to preserve the vessels of the mesenteric arcade, plus the time consumed for two anastomoses, plus gastrostomy, makes one wonder as to the time factor of this procedure and to the amount of infusions and/or transfusions utilized. The operation was carefully performed. The technique is good, and the photography is very well done. The surgical exposure is excellent. It will take more time, however, to determine whether some of the less radical and less time consuming procedures might not result in a lower morbidity and mortality with a greater degree of palliation. This film can be recommended for thoracic surgeons, bronchoesophagologists, and general surgeons interested in surgery of the esophagus.

County and Community Recreation 16 mm black and white sound showing time 29 minutes. Produced in 1951 by and procurable on rental or purchase (\$100) from the Audio-Visual Center Indiana University Bloomington Ind.

This film is a study of community organization for reaching an objective. In this particular instance the objective was a recreation program, though it could have been any of several community activities. Various means by which the necessary funds for the recreation program can be obtained were well set forth. Committee members investigated the work of other committees and were developing a recreation program for their own county. The film gives an indication of the content of a community recreation program and suggests the benefits to be derived from it.

The pace is very slow during the first part of the film. The chairman's speeches are too long. Approximately the first third of the film is devoted to the various methods of financing a recreational program. No mention is made, during this section of the film, of what a recreation program is or of the benefits that may be derived from it. In short, the methods for initiating the program are presented before the audience has a clear insight into what is being proposed. The film would be suitable for almost any grade level, though it would have its greatest usefulness as a means of suggesting to adult groups and the legislative bodies of local government ways and means by which recreation programs could be developed by them in their own communities.

Heredity and Pre-Natal Development 16 mm black and white sound showing time 21 minutes. Produced in 1950 by the National Film Board of Canada. Procurable on purchase (\$100) from McGraw Hill Book Co. Text Film Department 330 W 42nd St. New York 36 or on rental from local film libraries.

This film gives a step by step picturization of the growth subdivision, and eventual union of male and female sex cells. Discussion includes an explanation of chromosomes and genes in determining sex and in transmitting physical and mental characteristics to offspring. Stress is laid on the modification of these traits by training and environment. The film describes the fertilization of the ovum by the sperm cell at conception and traces the development of the fetus until delivery. A section of the film on the newborn considers the development of the basic physiological actions of breathing, eating and elimination. This material is presented with a truly remarkable and extremely commendable combination of objective scientific fact with occasional fanciful touches that save the film from becoming oppressive. The photographic and sound quality are excellent. This film will be of value to anyone interested in the subject. It will be of greatest value in biology courses on the senior high school and junior college levels. The picture will also be extremely helpful to physicians called on to discuss this subject before audiences of adolescents (ages 14 to 18) and groups of young mothers.

Central Retinal Vein Thrombosis.—Anticoagulant therapy has been advocated by some for the treatment of thrombosis of the central retinal vein, whereas others regard this form of treatment as ineffective. To obtain more information about this problem, Cassidy reviewed 54 cases of central retinal vein thrombosis that he had observed during the past 10 years. Treatment consisted in general hygienic measures such as rest, attention to hypertension or diabetes or other systemic disease, and the use of vasodilators such as nicotinic acid, Priscol (2-benzyl-2-imidazoline), and other indicated therapy including rutin and vitamin P. Anticoagulant therapy was used in 10 of these 54 cases for two weeks to 16 months. Anticoagulant therapy was started relatively early, but only two patients retained or recovered better than 20/200 vision. The other eight patients did not improve or became worse. The author stresses that central retinal vein thrombosis usually occurred in older persons with hypertension. The onset was sudden, but often there was some premonitory visual disturbance. Emotional upsets, trauma, systemic diseases, or vasomotor disturbances may have been contributory factors in some cases.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individual subscribers provided they reside in continental United States or Canada. Requests for periodicals should be addressed 'Library American Medical Association. Periodical files cover only the last 11 years and no photoduplication services are available. No charge is made to members but the fee for other borrowers is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted

Papilledema, retinal hemorrhages, exudates, and tortuous veins were found in the affected eyes. Reestablishment of retinal circulation did not affect the profound loss of vision. Anti-coagulant therapy, when used, did not appreciably influence either the retinal appearance or the recovery of function. There was no appreciable improvement in vision with or without anticoagulant therapy. Hemorrhagic glaucoma occurred in 9 of the 54 cases. In all of these, vision was lost. Six of the nine required enucleation to alleviate the severe symptoms. The prognosis of central retinal vein thrombosis is extremely grave and shows a direct relationship to the age and hypertension of the patient. There is no effective treatment.

Prevention of Atelectasis or Pneumonia Following Abdominal Operations.—According to Greene and Berkowitz, the primary step in their program of prevention of postoperative atelectasis or pneumonia, or both, is the detection of the patient with a predisposing tracheobronchial abnormality. This is most simply and reliably performed by the use of a test cough requested of the patient just before the induction of anesthesia. In the patient with a normal, 'dry' response a major pulmonary complication does not develop, regardless of the type of operation and anesthesia, and the patient does not need any special prophylactic care provided the respiratory tract does not acquire excessive mucus stimulated by anesthesia and is

not contaminated with gastric contents or blood during and after operation. A patient with a "wet" or "self propagating" test cough or one who has aspirated material into the respiratory tract is a likely candidate for atelectasis or pneumonia only if he is subjected to a period of respiratory depression or interference with the ability to cough vigorously during or after operation, or both. The duration of the required period of cough inhibition varies inversely with the wetness of the bronchial tree. Such patients may be uniformly protected by inducing a vigorous cough as soon as the anesthesia has diminished to the point of permitting a vigorous cough. Voluntary coughing or the involuntary paroxysm produced by antecubital intravenous injection of 2 cc of paraldehyde is usually sufficient to protect the mildly predisposed, cooperative patient; it cannot be relied upon for the patient with severely wet bronchitis who undergoes any major operation or in the mildly predisposed patient after upper abdominal or thoracic procedures. In these patients a vigorous cough should be induced routinely by synergetic tracheobronchial aspiration as soon as the patient has recovered the ability to cough forcefully. The soundness of this concept was proved by the results of a study of 2,246 major and 3,517 minor surgical patients managed in accordance with the authors' program. Only one instance of mild atelectasis appeared in this group, which included 223 subtotal gastrectomies and 359 biliary procedures. In the control group of 822 major operations there were 215 subtotal gastrectomies with 37 instances of atelectasis or pneumonia, including one death, and 413 biliary procedures with 42 cases of atelectasis or pneumonia, including one death. As a result of their experience the authors state that atelectasis and pneumonia are preventable by a strict regimen of detecting the abnormal tracheobronchial tree in the predisposed patient and removing potentially obstructing material by vigorous coughing induced during the early postoperative period. The appearance of atelectasis or pneumonia within 48 hours after an abdominal operation can, except for rare instances, be regarded as evidence of imperfect anesthetic care since the authors have demonstrated that it was almost wholly prevented by a program dependent on methods of diagnosis, prognosis, and prophylaxis specifically within the domain and capabilities of the anesthesiologist.

Prevention and Control of Allergic Conditions in Industry.—Whenever a chemical substance is introduced into an industrial process, it is advisable to determine its toxicological properties and to ascertain whether it will irritate or sensitize the skin. The author discusses the advantages and limitations of several methods that may be employed to ascertain the sensitizing

capacity or potential allergenicity of chemical compounds, such as the guinea pig technique, the patch test technique, and usage tests. Safety engineering measures are most effective in the safeguarding of an operation, which employs a sensitizer or irritant. Exposure should be prevented by enclosing the process involving the hazardous compound. If complete enclosure is not possible, a hygienic program must be instituted so that the worker has minimal contact with the sensitizing material by spillage, handling, and exposure to vapors and dusts. He must understand the safety program, and must have available adequate washing facilities. Persons who have (1) recurrent eczematous contact dermatitis from other industrial contactants, (2) seborrheic dermatitis, (3) dermatophytosis with an "id" reaction, (4) stasis syndrome, (5) ichthyosis, (6) pompholyx, and (7) other skin problems that result in itching and scratching should not be assigned to operations involving contact with sensitizing substances. The measures to be taken when an outbreak of dermatitis occurs in a plant are also discussed. Industrial dermatology and allergy have become as complex as the industrial scene itself. Cutaneous and allergic problems that arise in industry require the joint experience of personnel trained in industrial hygiene, toxicology, chemistry, dermatology, and allergy. Several teams are now active in this field, but their number is still small by comparison to the expanding requirements of industry.

Evaluation of Industrial Dermatitis by Analyzing Its Pattern.

In the past the principal means of detecting the causes of contact dermatitis have been history taking and patch testing. Waldbott here demonstrates how the analysis of a pattern of a lesion can be a most valuable aid in the appraisal of an industrial lesion. A hospital clerk presented a chronic, severe dermatitis on both hands which had started when he took up his present job. The areas of the hands involved by the lesions were those that would come in contact with a flat surface. In addition, it involved an area on the knuckles. The flat surface responsible was identified as a rubber pad on his desk. The eruption on the knuckles occurred because the patient was an amputee and had to lean heavily on the rubber desk pad when getting up from his desk. This and several other cases demonstrate Waldbott's contention that the pattern of a skin lesion can be very important in establishing its etiology.

Hypokalemia During Para-Aminosalicylic Acid Therapy.—Because a patient receiving *p*-aminosalicylic acid had two separate episodes of hypokalemia early in the course of therapy with this drug, studies were made to determine the incidence of hypokalemia in a selected number of patients treated with *p*-aminosalicylic acid, and to determine common factors in

such patients that might suggest the mechanism by which this drug produces a low potassium syndrome. In 8 of 38 tuberculous patients who were treated with *p*-aminosalicylic acid, hypokalemia was definitely established, 2 were considered as probably having hypokalemic episodes, and in 3 hypokalemia seemed possible, the remaining 25 patients showed no evidence of hypokalemia. Occurrence of hypokalemia could not be related to the dose of *p*-aminosalicylic acid. All but one of the 13 patients with proved, probable, or possible hypokalemia had severe, persistent vomiting and diarrhea. The other patient in this group had suggestive evidence of diarrhea. In contrast, only one of the 25 patients with no evidence for hypokalemia had severe and persistent gastrointestinal disturbances while receiving the drug. Although it is recognized that initial subclinical potassium deficit and the effect of increased ingestion of sodium contained in the sodium salt of *p*-aminosalicylic acid may be important contributory factors, it is suggested that the hypokalemia seen in these patients receiving *p*-aminosalicylic acid is in large measure secondary to gastrointestinal disturbances associated with the administration of this drug.

Cardiovascular Collagenosis with Parietal Thrombosis.—

Necrosis or fibrosis of the endocardium with overlying mural thrombosis in the absence of gross vascular disease appears to have been described under a variety of terms, such as endocarditis parietalis fibroblastica, fibrosis of the endocardium and myocardium with mural thrombosis, endocardial fibrosis, endomyocardial necrosis, primary subacute myocarditis, myocarditis perniciosa, and chronic fibroblastic myocarditis. In this paper Becker and his associates present observations on 40 cases of endocardial thrombosis that were selected for pathological study from a total of 9,500 autopsies performed at the University of the Witwatersrand, Johannesburg South Africa, during 1936 to 1951. Widespread involvement of the connective tissue throughout the body and particularly in the heart was demonstrated. Although the histological features were similar to those found in the "diffuse collagen diseases," they did not show the characteristic lesions of rheumatic fever, periarteritis nodosa, lupus erythematosus, or diffuse scleroderma. A rapidly progressive heart failure, together with the pathological findings, were sufficiently distinctive to consider this condition cardiovascular collagenosis with parietal thrombosis. Congestive cardiac failure was the cause of death in all cases and was manifested by edema, ascites, pleural effusions, and chronic venous congestion of the viscera. Solitary or multiple infarction of one or more viscera was found in 78% of patients. The lungs, spleen, kidney, and brain were the organs usually infarcted. The cardiac lesion was characterized by an enlarged,

dilated heart, usually without hypertrophy, mural thrombosis, especially in the left ventricle, subendocardial necrosis or fibrosis, fibrosis or necrosis of papillary muscles, focal or diffuse thickening of the endocardium, and absence of significant lesions in the pericardium, cardiac valves, coronary vessels, or aorta. Depending on the histological features, the authors differentiate between an acute, subacute and chronic form of the disease. The histological and clinical features are described in detail.

Phlebodinia, A New, Possibly Epidemic, Disease.—Pearson directs attention to a previously unreported syndrome. The common characteristic of the 22 nurses who presented the syndrome was incapacitating pain and exquisite tenderness along the course of the superficial venous tracts of one or more extremities. The first two patients were thought to have recurrent phlebothrombosis, although they did not present the usual phenomena of arterial spasm, skin discoloration, or edema of the involved extremity. One of these first patients was subjected to ligation and resection. On resection, the vein wall was thought to be thickened, but no thrombus was found. After more cases occurred in the student nurse population, it was felt that there might be an epidemiological problem. With this in mind, the Communicable Disease Laboratory of the National Institute of Health was called in. The representatives of this organization spent several days exhaustively studying all aspects of the outbreak without any positive results. Blood and serum specimens were collected from all cases and subjected to tests, cultures, and agglutinations without positive results. Veins were sectioned and sent to various pathologists, who did not agree and did not reach a specific diagnosis. Many of the newer antibiotics were tried in the treatment, but without effect. Prolonged bed rest with elevation of the leg caused a remission, but there was a recurrence in several cases.

Viomycin Therapy in Pulmonary Tuberculosis—Of 80 men with moderately or far advanced pulmonary tuberculosis and with sputums positive by culture for *Mycobacterium tuberculosis* before the institution of treatment, 36 received 1 gm of viomycin at 8 a m and at noon and 1 gm of streptomycin at 8 p m every third day. Twenty-two patients were given 2 gm of viomycin in two divided doses every third day and 12 gm of *p*-aminosalicylic acid daily, the remaining 22 patients received 2 gm of viomycin in two divided doses every third day. Viomycin and streptomycin were administered intramuscularly and *p*-aminosalicylic acid orally. Duration of treatment in all patients was 120 days, except in one patient in whom drugs were discontinued because of toxic side-effects. Results suggested that viomycin is capable of exerting a favorable effect on the clinical course of pulmonary tuberculosis. The therapeutic effectiveness of viomycin was considerably less than that of streptomycin, but approximated that of

p-aminosalicylic acid Viomycin combined with either streptomycin or *p*-aminosalicylic acid was superior to any of the drugs employed alone. There was a high incidence of mild untoward reactions to viomycin, such as significant pain at the site of intramuscular injection in 32 patients, fever in 21, and drug rash in 14. For this reason prolonged administration beyond 120 days was impractical in the few patients in whom it was attempted. Mild renal irritation was evidenced in most patients by occasional cylindruria and slight albuminuria, which disappeared after termination of viomycin therapy. Serious eighth cranial nerve dysfunction and serum electrolyte disturbances were not observed. The high incidence of clinical and laboratory toxicity from intermittent viomycin was predominantly minor, transient, and reversible after termination of therapy. This is in striking contrast to toxicity reported when viomycin is administered daily. It is believed that viomycin is a relatively safe drug when administered intermittently, provided its potential toxicity is appreciated and appropriate clinical and laboratory surveillance is maintained.

Segmental Resection in Tuberculosis—Of 539 patients who had various types of resection of lung tissue for pulmonary tuberculosis between 1947 and 1952, 123 underwent segmental resection. This group was followed six months to four and a half years. Of the 123 patients, 75 had only segmental resection and 48 had segmental resection and lobectomy. Fifty of the 75 patients had primary resections, while 25 had previous surgical procedures. The tuberculous death rate was low in all groups, but it is significant that there was none in the primary resection group. Nontuberculous deaths from pulmonary embolus, hemorrhage from a contralateral cavity and pulmonary insufficiency occurred just half as frequently in the primary as in the secondary resection groups (4% vs 8%). Serious complications, such as ipsilateral exacerbation, fistula, empyema and bilateral spread, occurred only in the secondary group. Results obtained with segmental resection were excellent when it was used as the primary procedure in patients with lesions well limited to the segment or segments being resected. Poor results were observed when segmental resection was used in patients with widespread disease or when used as a secondary procedure. The excellent results obtained are a reflection of the limited disease and the excellent condition of the patients. Three cases are described to illustrate problems in the treatment of pulmonary tuberculosis for which segmental resection was applied by the authors.

- *Dietary Treatment of Hypertension. III. Effect of Protein on Appetite and Weight. V P Dole, L K Dahl, L L Schwartz and others—p 185

Effect of Protein on Appetite.—In an earlier study it was observed that patients rapidly lost weight following a change in diet from a conventional pattern to the rice fruit diet of Kempner. Although the imbalance was temporary, as shown by the approach to stable weight and nitrogen balance during the next four months, the weight remained at the lower level. During the period of rapid weight loss, the patients took a reduced number of calories as compared to their previous consumption. However, as the weight approached stability, the intake of calories rose to the neighborhood of the control values. In the subsequent study, which was directed mainly to the role of sodium, it was found that extreme changes in the ration of sodium had no important effect on the appetite or weight. It was surmised that the restriction of dietary protein to about 35 gm per day, which appeared as an incidental restriction when dietary sodium was limited to 4 mEq per day, was the factor that caused the reductions in appetite and weight. In the present study this hypothesis has been given a systematic test. Essentially the same basal diet has been employed with the addition of a salt-free milk product that permitted large variations in the intake of protein while the ration of sodium was held constant. Six patients with uncomplicated hypertension served as subjects for the present study. The reduction of blood pressure following restriction of dietary sodium was found to be independent of tenfold variations in the ration of dietary protein, and unaffected by

prior or subsequent reduction of body weight. The data indicate that restriction of dietary sodium may be expected to reduce the systolic and diastolic blood pressures by $12 \pm 7.4\%$. The ration of protein, under the conditions of this study, was seen to determine the appetite and the body weight of each patient. It might seem odd that patients lost weight when changed from one adequate diet to another, but the result can be explained on the hypothesis that the reduction of body mass is an adaptation to the reduction of dietary protein. The lack of hunger or weakness during the loss of weight indicated that the diet might be of some use in the treatment of obesity.

Potassium Depletion from Overuse of Laxatives.—It is well known that diarrhea caused by a variety of gastrointestinal disorders may lead to potassium depletion. This paper presents observations on two otherwise healthy women who, prior to this study, had gradually developed severe potassium depletion and hypokalemia as the result of chronic diarrhea induced by overuse of laxatives. Although in each instance there had been a loss of approximately one third of total normal body potassium, there were no other significant disturbances of water and electrolyte balance and no overt signs of malnutrition. These two subjects thus presented an unusual opportunity to observe the clinical and physiological effects of uncomplicated potassium depletion. Neither of the patients had any overt neuromuscular symptoms or signs, and it was only through the discovery of T-wave changes in routine electrocardiograms that hypokalemia was discovered. There were no other disturbances of serum electrolytes except for slight elevation of plasma bicarbonate in one patient. Red cell sodium, potassium, and phosphorus concentrations were normal. Renal excretion of potassium was very low. When laxatives were withdrawn and the patients given normal oral intakes of potassium, each retained an amount of potassium roughly equivalent to one half the total initial body potassium content without significant retention of nitrogen or phosphorus. Changes in total exchangeable potassium were approximately equal to the actual potassium retention. In both instances potassium retention was accompanied by a large but transient retention of sodium. Internal balance calculations indicated that cellular uptake of potassium was approximately equal to the estimated loss of intracellular sodium and that total initial intracellular cation concentration was markedly reduced. Excretion of ammonium was relatively high initially and during correction of the potassium deficit ammonium diminished rapidly without significant change in urine pH or titratable acidity. Ability to concentrate the urine was impaired in both patients prior to treatment, but was restored to normal after correction of the potassium deficit. Clearance studies begun immediately after treatment revealed slight reductions in glomerular and tubular function in the first patient, but severe depression in these functions in the second patient. After correction of the potassium deficit all functions gradually returned to normal. It is suggested that renal dysfunction may account for certain disturbances in water and electrolyte metabolism observed in potassium deficiency.

Pyrazinamide in Tuberculous Lymphadenopathy.—This report is concerned with 19 patients in whom pyrazinamide (Aldinamide) was employed for the treatment of tuberculous lymphadenitis and draining sinuses. Seven of the 19 patients received surgical treatment in the form of excision of diseased nodes and sinuses. The remaining 12 patients received no surgical treatment, except that in 3 of them fluctuant masses were aspirated. Treatment with pyrazinamide was continued for from 11 to 90 days, averaging approximately 70 days in the group not operated on and 22 days in the patients who also received surgical treatment. The dosage schedule was 1 gm three times daily for all except the smaller children and one

elderly patient, who received smaller doses. The total doses ranged from 70 to 220 gm and averaged 188 gm in those who were not surgically treated and 63 gm in those who also received surgical treatment. Toxic side reactions, in the form of dizziness and gastrointestinal upsets occurred in only one of the patients and subsided a week after the drug was discontinued. The immediate results of treatment were good in all instances. In five of the seven patients operated on primary healing took place, in the other two surgically treated cases healing was complete after three and five weeks respectively. The follow-up periods following cessation of treatment in the 12 who were not operated on averaged only slightly over eight weeks. Evidence of recurrence appeared in only one of these patients. In two instances there was evidence of resolution of pulmonary lesions. The cases reviewed will require further follow-up studies, but the authors feel that the use of pyrazinamide is justified in tuberculous lymphadenopathy.

Suture Constriction in Treatment of Pulmonary Tuberculosis.

—A modified partial thoracoplasty and extensive pneumonolysis with collapse and compression of lung by suture ligatures, devised by the Brazilian surgeon Paulino, was employed by the authors 34 times in 31 patients with pulmonary tuberculosis, including bilateral operation in 3 patients. The disease was unilateral in four patients, bilateral in 27, moderately advanced in 5, and far advanced in 26. The unique feature of the procedure is the method of achieving collapse, and preventing reexpansion, of the diseased lung by three concentric purse-string ligatures of no. 10 crochet cotton placed about the lung and the overlying parietal structures which have been freed from the chest wall according to the Carl Sembr technique. Four of the 34 operations have been performed

only recently and, although adequate collapse has apparently been obtained and the patients are improved, it is too early to evaluate the results. Two patients were lost to follow up. Of the remaining 25 patients who were operated on more than seven months ago, the disease has become inactive in 5 for periods of 6, 8, 18, 18, and 22 months. The disease has been arrested in 13 additional patients for 4.5 to 24 months, with an average arrest of 12.3 months. Three patients were classified as active and improved, and one patient had only a single postoperative checkup and was classified as 'activity undetermined'. There were two early postoperative deaths from respiratory failure and massive pulmonary embolism on the 8th and 14th postoperative day respectively, and one late postoperative death from hemorrhage in the fifth month. As a result of their experience the authors state that the operation, which is performed in one stage, is safe, it minimizes costal resection, deformity, and loss of respiratory function, and has been applied successfully to bilateral disease. The Paulino procedure is recommended particularly when bilateral surgical procedures seem indicated or when the respiratory reserve is limited. As the operation has several additional advantages, it may also be used by election rather than the more extensive multistaged selective thoracoplasty of the Alexander type.

Unusual Carcinomas Involving Prostate Gland—This report is based on a review of seven cases in which a squamous cell carcinoma apparently was confined to the prostate gland, eight cases in which a squamous cell carcinoma arose in the epithelium of the vesical neck and involved the prostate gland, six cases in which an adenocarcinoma of the rectum subsequently extended to the prostate gland, one case in which metastasis to the prostate gland occurred several years after operation for carcinoma of the stomach, and one case in which a mucoid carcinoma of the prostate gland developed after the removal of a carcinoma of the lung. In the majority of cases, the smooth, soft consistency of the prostate gland led the examiner to believe that a malignant lesion was not present. After the malignant character of the lesions had been recognized in the 23 cases cited here, hormonal therapy was found ineffective. There was no elevation of the serum acid phosphatase values in the cases in which the concentration of this enzyme was determined. The survival period following operation was much shorter than it usually has been in cases of adenocarcinoma of the prostate. While most of the varieties of carcinoma mentioned here have been described previously, the authors feel that the unusual features in some of the cases and the fact that not all prostatic carcinomas are adenocarcinomas deserved more emphasis.

Management of Pain of Cancer—Many of the 200,000 persons who die each year from cancer in the United States suffer severe pain during their last months of life. The pain becomes progressively severer and finally develops into a boring, relentless, intolerably agonizing suffering that all too soon causes a physiological as well as psychological deterioration. The deplorable attitude of defeatism found in some quarters must be abandoned and replaced by courageous aggressiveness tempered by sane judgment. The following factors are

responsible for the pain: compression of nerve roots, trunks or plexus by the tumor or by pathological fractures of bones adjacent to the nerves, infiltration of nerves and blood vessels by tumor cells, resulting in perivascular or perineural lymphangitis and irritation of sensory nerve endings, and producing a diffuse burning pain, the so-called sympathetic pain; obstruction of a viscus, with production of true visceral pain; occlusion of blood vessels by the tumor, infiltration, tumefaction, and swelling in tissue invested snugly by fascia, periosteum, or other pain-sensitive structures, necrosis, infection, and inflammation of pain sensitive structures causing pain that is sometimes excruciating. The author briefly comments on the importance of psychological support for these patients and on palliative operation, but is concerned chiefly with nerve blocking. Analgesic block, when properly executed and effective, affords adequate relief without adding to the patient's discomfort. For pain of the face, mouth, tongue, throat, and neck, alcoholic injection of the trigeminal nerve or its branches, the glossopharyngeal and vagus nerves, and/or the upper cervical spinal nerves is usually very effective. Pain below the neck can be controlled for weeks or months with subarachnoid alcohol block, paravertebral block, or injections of peripheral or intercostal nerves. Since in many of these cases the sympathetic nervous system is involved in the pain mechanism, sympathetic nerve blocks are occasionally necessary to completely alleviate the pain.

Parenteral Nutrition.—In order that homeostasis be maintained when parenteral nutrition becomes necessary, it would seem reasonable that an artificial or parenteral food should supply elements resembling normal constituents as closely as possible. Consequently, the authors prepared a solution containing 12% invert sugar, 6% amino acids and 4% alcohol, which furnishes 1,000 calories per liter and approaches the ideal proportion in terms of normal human intake of the various food substances. A continuous infusion of this solution over several days by use of a polyethylene tube inserted through a no 15 needle into the basilic vein of the antecubital fossa has been studied in 57 cases to determine its effect on the patient's physiological processes in terms of fluid, nitrogen, and electrolyte balance. Results showed that invert sugar can be used in greater concentration without producing as much hyperglycemia or glycosuria as is produced from equivalent percentage of glucose. At the recommended rate of administration of 3,000 cc of the solution in 24 hours, or a liter every eight

hours, the blood alcohol elevation proved to be almost negligible. Additional evidence has been presented supporting the thesis that parenteral protein requires adequate caloric intake for optimal utilization of amino acids. The pH of the tested solution is 5.55 and, although quite acid, it did not cause undue reaction in the tissues when infiltrated out of the ordinary intravenous needle. When introduced in the described way by a polyethylene catheter in an arm vein, the only reaction noted was from the polyethylene tube itself. If the tube was changed to another vein at the earliest sign of phlebitis, then only a very minor reaction was caused. Slow, continuous, around-the-clock infusion through plastic venous catheter afforded best utilization of all constituents of parenteral alimentation. An illustrative case is described of proper and complete parenteral administration in a 40-year-old woman who had a Whipple resection for carcinoma of the ampulla of Vater and was given a continuous infusion of the authors' solution for the first five postoperative days. All nutritional factors studied, including potassium, sodium, nitrogen, caloric percentage and water, showed a nearly perfect balance and her clinical course described by the fever chart and the ability to resume complete oral food intake by the sixth postoperative day indicated rapid surgical recovery.

Effect of Aureomycin and Chloramphenicol on Fungal and Bacterial Flora.—Undesirable side-effects resulting from treatment with chloramphenicol and aureomycin include glossitis, stomatitis, sore throat, proctitis, pruritus vulvae and ani, nausea, vomiting, diarrhea, bronchomoniliasis, mycotic endocarditis and meningitis, and the sprue syndrome. It has been suggested that these effects are a result of increased growth of *Candida albicans*. McGovern and associates decided to determine the incidence of *C. albicans* in the gastrointestinal tract of normal children, and to observe the clinical, bacteriological and mycologic alterations that occur in children after administration of antibiotics. Studies on 100 healthy children disclosed that *C. albicans* could be demonstrated in small numbers in the mouths of 14% of the children and in the rectum in 6%. The incidence of *C. albicans* in the gastrointestinal tract of 45 children to be treated with antibiotics was 17%,

this rose to 33% at the end of the treatment period. Twenty-one of these children were given aureomycin orally for eight days, and 24 were given chloramphenicol intramuscularly or orally for 10 to 14 days. By the third to the eighth day of treatment, the average number of colonies of *C. albicans* had increased from 3 to 50. There was a marked decrease in gram-negative and gram-positive organisms in the gastrointestinal tract, with a concomitant increase in the fungal floras, including yeasts and various species of *Candida* organisms other than *C. albicans*. Although *C. albicans* was apparently induced to grow in 17% of the 45 patients observed, clinical thrush did not appear in any patient, however, the authors noted clinical thrush in 4 unreported cases in which the broad-spectrum antibiotics were given either in larger doses than those used in this study or in the same dose for longer periods. It seems that the duration of treatment, the dosage, and the presence or absence of *C. albicans* before treatment are important in determining whether thrush or other forms of moniliasis will develop during therapy with broad-spectrum antibiotics. The danger of moniliasis in children from the use of these drugs in therapeutic doses does not seem great when the drug is administered for not more than eight days.

Prodromal Stage of Diabetes Mellitus.—In an attempt to explain the presence of obesity before the onset of diabetes mellitus and the weight loss that commonly follows the onset of diabetes, Allen studied the early history of diabetic patients. He found that a family history of diabetes need not always be present, but both the gain and the loss of weight are usually preceded by some severe infection or a long continued toxic state that causes an imbalance in metabolic processes. The initiating toxemia is followed by excessive gain in weight, because excessive appetite, piecing between meals, at bedtime or on waking during the night, relieves the patient of several of the following symptoms: hunger, weakness, nervousness or irritability, trembling and/or fluttering in the epigastrium, sweating, night sweats, restlessness at night, and a dull, weak feeling or headache in the morning before breakfast. These symptoms, which suggest hypoglycemia due to excess of insulin, may have existed for many years, when another infectious or toxic period is followed by loss of weight, polyphagia, polydipsia, and polyuria. With some of these conditions in mind, 252 cases were reviewed in 1943 and the above symptom complex was found in 24% of the patients. With broader experience the percentage rose to 33.5% in the next group of 298 patients, and to 76.1% in the last group of 657 patients questioned in the diabetic clinics at which the author is a consultant, for the total of 1,207 cases this amounts to 54.77%. The author reasons that due to stress and/or toxic states, the organism first produces an excess of insulin and hypoglycemia results, which causes exhaustion of beta cells of the pancreas. In this overworked state, these cells are easily damaged by a second or repeated toxic state and they become permanently damaged so that the production of insulin is far below the normal demand, and the organism loses its ability to metabolize glucose. The blood sugar rises above normal levels and the result is diabetes mellitus.

Oral Administration of Living Poliomyelitis Virus to Human Subjects.—In a previous report Koprowski and associates had described the results of oral administration of the TN strain of rodent-adapted living poliomyelitis virus to 20 human volunteers. None of the subjects showed untoward effects from the administration of the virus. In this paper they present the results of oral administration of the same type of virus to 61 human subjects, all of whom had no Lansing antibodies prior to the experiment. None of these patients showed clinical signs of illness, and no viremia was found. Although the could be demonstrated in the stools of 29 out of 61 the antibody response indicates that infection was

established in many, more cases, since the serums of only 6 patients had no neutralizing antibodies on the 30th day after ingestion of virus. One may assume that in five of these six patients the virus was destroyed before reaching the intestinal tract, since no virus was isolated from their stool specimens. There was either insignificant or no rise in antibody response in three other patients whose blood did show some neutralizing power when drawn prior to feeding with virus. However, the authors suggest that the level of antibodies observed in the latter three patients should be considered high enough to prevent paralysis after a peripheral exposure to virulent Lansing type virus. Perhaps another oral administration of the TN strain to the nine patients would result in multiplication of the virus in the intestinal tract and subsequent adequate serological response.

Mechanical Air Drying of Hands After Preoperative Scrubbing.—It seemed that simple air-drying of the hands would eliminate some probabilities of contamination involved in the use of sterile towels for drying, such as improper rotation of the towel during drying or the touching of the scrub suit or of the unscrubbed portions of the upper extremities. Before accepting the air dryer, however, it had to be determined whether or not the forcing of warm air over the extremities would increase contamination, and whether or not it would be practical. Bacteriological studies of 304 cultures, taken from groups of surgical personnel after use of a standard scrub technique, showed a probably significant reduction of gross contamination of the hands when a mechanical air dryer was used. Furthermore, the mechanical air-drying technique is less expensive than the towel-drying technique.

Saucerization and Bone Grafting in Chronic Hematogenous Osteomyelitis.—In general, surgical eradication of the infection in the localized posttraumatic form of chronic osteomyelitis is not so difficult as the eradication of an area of chronic hematogenous osteomyelitis. Thirty six patients with chronic hematogenous osteomyelitis were treated by bone grafting at the Mayo Clinic prior to January, 1951. All except nine of the patients had had previous drainage treatment, either continuous or intermittent. The osteomyelitis had persisted for from one to 50 years. In those in whom the disease had persisted for more than 20 years, the treatment failed in 5 of 14 cases. Treatment was successful in a total of 28 of the 36 cases. The tibia (19) and the femur (14) were the most frequent sites of involvement. The types of surgical procedures used and the results obtained were saucerization and immediate bone grafting in 19 cases, with 15 successes and 4 failures, saucerization, packing, and later bone grafting in 16 cases, with success in 12 and failure in 4, saucerization and packing followed by skin grafting with bone grafting later in one successful case. Results according to the type of graft used were autogenous iliac in 11 cases with 10 successes, homogenous (frozen bank) in 20 cases with 15 successes, autogenous and homogenous in 5 cases with 3 successes. Of eight failures, five occurred when homogenous bone alone was used, two when homogenous bone was used to supplement autogenous iliac bone, and only one failure occurred when autogenous iliac bone was used alone. The only failure when autogenous iliac bone was used, was in a case in which grafting was done two weeks after saucerization, and in which inability to control infection with antibiotics led to removal of the grafts. A light cast or posterior molded splint was used in a few of the cases, but immobilization was not considered necessary in those cases in which motion of the extremity did not jeopardize continuity of the closure and in which there was no danger of spontaneous fracture as a result of extensive saucerization. It seems well to keep a drain in the wound until the primary hematoma has been evacuated, since some patients had a postoperative serosanguineous drainage. In most patients (23), complete healing resulted in two to three weeks. Thus it appears that more rapid and more nearly permanent healing may be obtained by this than by other methods of treatment.

Histological Grading of Cancer of Uterine Cervix.—Graham surveys and evaluates the various methods of histological grading of cervical carcinoma. Schottlander and Kermauer in 1912 suggested the system that has since become standard in

many European countries. The tumors are first divided into adenomatous and solid types. The solid carcinomas are graded as mature, semimature, and immature. Broders of the Mayo Clinic in 1920 and 1922 developed a method that divides the tumor into differentiated and undifferentiated parts, and then, according to the relative amount of the two types, it is assigned to one of four grades. This method is the one most frequently used in North America. Other methods of histological grading have been introduced by Martzloff, by Chambers, by Truelsen and Bang, and by Glucksmann and Spear. All these methods of histological grading are based on the degree of anaplasia versus differentiation. The technique is partially subjective and limited by the biopsy specimen, which may or may not be a good sample of the tumor. The degree of anaplasia correlates poorly with the clinical extent of disease when the patient is first seen but somewhat better with the incidence of metastases in postmortem material. Radiotherapy results in a moderately higher "cure" rate in differentiated tumors than in anaplastic ones. Some results of surgically treated highly anaplastic tumors are poor. It is concluded that histological grading is of limited prognostic value in cancer of the cervix.

Poisoning with Acetylsalicylic Acid.—An 18 month old boy swallowed 15 to 20 1¼ grain (75 mg) tablets of acetyl salicylic acid (aspirin), a total of 20 to 25 grains (1.3 to 1.6 gm). He had seemed all right after this, had had a normal day, had taken his usual meals and had gone to bed in good condition. Eighteen hours after ingestion, at 3:30 a.m. the nurse noticed the child breathing rapidly in a deep, pauseless manner. He looked pale and lethargic but could be roused. He was taken to the hospital at once, but all measures were without effect and he died nine hours after admission. The results of necropsy are described, and the literature on the subject is reviewed. Infants and children seem peculiarly susceptible to relatively small amounts of acetylsalicylic acid (aspirin). Unexplained hyperpnea in infants and children should suggest salicylate intoxication. Salicylate is always found in the blood and urine to confirm a diagnosis of poisoning with acetylsalicylic acid. Hydration and correction of acidosis are the two most important factors in treatment of the acidotic stage. Acetyl salicylic acid has a cumulative effect when given over a period of time. A safe dosage for children is 1 grain (65 mg) per year of age. In accidental ingestion of an unknown amount gastric lavage is advocated.

- Blood Pressure Reducing Effect of Vitamin K in Hypertension K D Klein —p 226

Penicillin-Streptomycin Therapy of Diphtheria.—Schneider used a preparation containing penicillin and dihydrostreptomycin in the treatment of diphtheria. His aim was to find whether and to what extent penicillin plus streptomycin was superior to penicillin alone. He found that in cases of diphtheria of moderate severity the effect of penicillin in combination with diphtheria antitoxin is so excellent that further improvement in therapeutic efficacy is not to be expected. However, in the presence of severe toxicity and of septic conditions and particularly in patients who do not receive clinical treatment until quite late in the course of the diphtheria (at the end of the first or at the beginning of the second week), the administration of penicillin and streptomycin in combination is of value. This is evidenced by the more rapid decrease of the temperature and demarcation and detachment of the coating membranes. The circulation, which has been damaged by the toxins, becomes normal within a few days, without support by circulatory stimulants. There is rapid improvement in the feeling of well-being, and the defense powers of the organism increase. Finally there is a saving of penicillin and serum. Moreover, probably as a result of the more rapid elimination of the pathogenic organisms, and thus cessation of toxin production, toxic nerve damage can be avoided. The combination of streptomycin and penicillin is also effective in treating chronic bacilli carriers. Because of these advantages, the combination of penicillin and streptomycin can be regarded as a definite improvement in the therapeutic armamentarium against diphtheria. The practical application of his observations the author formulates as follows. In the mild cases of diphtheria he uses only diphtheria antitoxin. In the moderately severe cases he gives penicillin in addition to the antitoxin. In the toxic and septic cases, and in those in which treatment is begun late, he uses penicillin and streptomycin in addition to serum therapy. The combination of penicillin and streptomycin should be used also to render free from bacilli those patients who continue to excrete diphtheria bacilli, particularly the chronic carriers.

- *Present and Future Clinical Management of Renal Tuberculosis E Rehn. —p 337
- *Treatment of Tuberculous Meningitis H Fedtke and G Müller —p 343
- Significance of Spontaneous Pneumoperitoneum in Silent Perforation of Stomach F Best —p 346
- Treatment of Congenital Syphilis E Landes. —p 349

Clinical Management of Renal Tuberculosis.—Within the last 20 years nephrectomies were performed in Freiburg, Germany, on 310 patients with surgical tuberculosis of the kidneys. Post-operative deaths occurred in 33 of the 310 patients, a very high mortality rate as compared to that of gastrectomy (4 to 5%) for ulcer and carcinomatous ulcer. Of the 33 deaths, 4 resulted from embolism and 2 from late collapse. Of the remaining 27 deaths, 10 resulted from hematogenous spread of the tuberculosis, 8 from reactivation of organic tuberculosis, and 7 from failure of the second kidney due to toxic nephritis and resulting activation of tuberculosis. The common post-operative complications thus were of little significance as compared to the sequelae of the general tuberculous disease. According to the author, this may be explained by hormonal phenomena. Any stress such as operative trauma or the dissemination of toxins from a tuberculous focus increases the secretion of glucocorticoids such as cortisone from the adrenal cortex. Cortisone then favors growth and dissemination of bacilli by the prevention of cellular defense reactions. Thus new tuberculous foci may occur in the second and as yet

healthy kidney. These may remain localized and latent as long as the antitoxic effect of the cortisone is still present, since, as Tonutti has shown, in guinea pigs, after the hypophysis has been removed, the small doses of cortisone can neutralize lethal doses of tuberculous toxins. The author, therefore, agrees with Tonutti that in tuberculous patients the unimpaired function of the adrenal cortex is of greatest importance for the course and prognosis of toxic dissemination. The tuberculous nephritis is to be considered an indicator of an approaching deterioration of the state of immunity due to the exhausted or impaired adrenal cortex because of the overload placed by the tuberculous toxins on its reaction capacity. The rules that according to Tonutti govern the relationship between diphtheria toxin and the diencephalon-pituitary-adrenal cortex system also apply to that of the tuberculous toxin and the same organ complex. Any surgical treatment of renal tuberculosis depends on the knowledge of this specific operative risk. Its early recognition is facilitated by the diagnosis of the toxic nephritis with the aid of the acid-alkali tolerance test in its classic form. The same test may also be used to determine the right time for the surgical intervention. The operative risk can be lessened by the administration of amithiozone (Conteben). Its detoxicating property is somewhat similar to the antitoxic effect of cortisone, but while cortisone removes the adrenal cortical deficiency and as a direct substitute increases the toxic effect, amithiozone neutralizes the tuberculous toxin and protects the diencephalon-pituitary-adrenal cortex system. Although amithiozone may cure the tuberculous nephritis and may increase the tolerance of the patient to the operation, surgical intervention is indispensable. In one patient with a tuberculous cavity in the left kidney and a toxic nephritis in the right kidney, the author gave a three months course of amithiozone and p-aminosalicylic acid, and then instead of performing partial resection of the left kidney, he collapsed it with several through and through quilting sutures. Complete cure of the tuberculosis was obtained as demonstrated by pyelography. In the future collapse therapy combined with chemotherapy may be used likewise for unilateral renal tuberculosis.

Treatment of Tuberculous Meningitis.—Of 10 patients with tuberculous meningitis, 3 were given a therapeutic trial with streptomycin combined with isoniazid. Streptomycin was given intramuscularly in doses of 30 to 40 mg per kilogram of body weight but not exceeding 15 gm daily in two divided doses, and in addition intrathecally in doses of 25 to 50 mg daily depending on the age of the patient. Beginning with the fifth week of treatment, streptomycin was given intrathecally only every second day and from the ninth week onward only twice a week. Beginning with the fourth month of treatment, streptomycin was given intramuscularly only every second day instead of daily. Isoniazid was given orally in daily doses of 5 to 8 mg per kilogram of body weight. Six patients were given streptomycin intramuscularly and intrathecally and purified tuberculin intrathecally starting with 0.01 to 0.5 tuberculin unit according to the severity of the reaction to the Mantoux test and increasing this dose by 50 to 100% with each subsequent injection. The maximum dose so far used consisted of 14 intrathecal injections of purified tuberculin with a maximum single dose of 5 units. Although follow up has been too short for final evaluation, the authors feel justified in stating that early treatment with intramuscular and intrathecal injections of streptomycin combined with orally administered isoniazid is at present the most promising method of treatment of tuberculous meningitis. Prospects are good for obtaining a cure of the specific meningitic process even in patients of advanced age and in those with other tuberculous manifestations, such as pulmonary tuberculosis and milary dissemination. Additional treatment with intrathecal injections of purified tuberculin may have a favorable effect in patients with a torpid course threatened with the development of internal hydrocephalus resulting from obstruction of the foramina of the ventricular system at the base of the brain or with spinal block. It seems that this method favors the regression of specific foci in the meninges and the central nervous system as well as the absorption of the fibrinous deposits at the base of the brain and in the spinal canal. Thus irreversible cicatricial stenoses and adhesions may be prevented. In the authors' last patient, an 11-year-old girl with internal hydrocephalus due to circa-

trical stenosis, continuous drainage of the ventricular system at the base of the brain was attempted with a polyvinyl catheter passed from the inferior horn of the lateral ventricle to the cell system of the mastoid process. Pronounced improvement for several weeks resulted from this artificial drainage that functioned despite the severe lesions. However, death from chronic tuberculous meningitis with extensive adhesions at the base of the brain, specific endarteritis, and internal hydrocephalus could not be prevented because of delayed institution of treatment. The authors consider this method as promising.

Transmission of Penicillin Through Human Placenta—Thirty parturient women were given intramuscular injections of 400,000 units of penicillin immediately after having entered the delivery room, and during delivery, blood was obtained from the arm vein of the mother and from the umbilical cord. The penicillin content of the serums was compared. The ratio between the serum content in the infant and in the mother increased up to three and one half hours after the injection, at which time the penicillin content of the serum of the infant was equivalent to 60% of the penicillin content of the maternal serum. It is assumed that the penicillin passes through the placenta according to the laws of diffusion, the rapidity of transmission seems to depend on the size of the placenta. Soon after the injection of penicillin into the mother, the penicillin is excreted through the kidneys of the infant and soon appears in the amniotic fluid, its concentration in the amniotic fluid being higher than in the serum of the infant. The authors emphasize that it is not correct to speak of the penicillin content of the blood, because the penicillin content is ascertained in the serum, and the penicillin content of the cellular portion of the blood is only a fraction of that of the serum. In the newborn, serum accounts for 40% of the blood and in adults for 56%.

New Methonium Compound in Arterial Hypertension—Smirk tested the effects of a new methonium compound, pentamethylene 1,5-bis-N-(N-methylpyrrolidinium) bitartrate, also referred to as M & B 2050A, in patients with hypertension. The drug was administered by subcutaneous injection and by mouth. Initial subcutaneously administered doses of the drug were about five times as active as initial doses of hexamethonium bromide, and the fall in blood pressure lasted longer. The new drug seems to control the blood pressure without toxic manifestations in a majority of hypertensive patients. In a few patients doses adequate to produce hypotension cause extreme mouth

dryness. The new drug should prove superior for oral administration to hexamethonium bromide, pentamethonium bromide, and some other hypotensive drugs, provided that additional side-effects do not appear with continued treatment. In four months of continued administration, toleration and cross toleration did not develop to the same extent as with the earlier methonium and some other hypotensive compounds. The oral dose of the new methonium compound is much greater than the effective subcutaneous dose but much smaller than the oral dose of hexamethonium salts. The comparative lack of side-effects during oral administration of the new drug may be related to the fact that the patients who gave the best responses to oral hexamethonium salts were usually those who required only small doses. Like hexamethonium bromide, the new methonium compound gives rise to postural hypotension in the erect posture and leads to an additional fall of blood pressure after meals. The pulse rate is ordinarily accelerated or little changed. Papilledema, soft retinal exudates and hemorrhages, breathlessness, and headaches have diminished sooner on treatment with the new drug than during treatment with hexamethonium salts. Preliminary studies justify extensive therapeutic trials with the oral administration of the new drug, but the mode of administration differs from that found suitable for hexamethonium bromide. In cases in which secondary effects prevent continued oral administration, the new drug should be dissolved in 25% polyvinyl pyrrolidone, to which 1 in 1,000 ephedrine hydrochloride is added to slow the absorption further. This preparation is injected twice daily with an interval of 10 to 12 hours between the injections.

Meperidine for Prevention of Coughing During Intratracheal Anesthesia—The presence of a rubber tube in the trachea during anesthesia increases the likelihood that the patient will cough. Other factors that predispose to cough include the increased sensitivity of the tracheal mucosa as the result of tracheitis in smokers and the augmentation of laryngeal irritability induced by pentothal. The synthetic analgesic, meperidine (Pethidine or Demerol) has a spasmolytic effect on the smooth muscles of the bronchial tree, and so Buschkens began a clinical study on its cough preventing effect. Alternate patients of a total of 44, who were anesthetized with thiopental (Pentothal), nitrous oxide, and oxygen and supplemental tri-chloroethylene, were given 5% meperidine hydrochloride in an average dose of 38.9 mg during the first half hour and a mean total dose of 65.7 mg. Coughing was significantly reduced in the 22 patients who had received meperidine. Buschkens believes that the use of meperidine should be considered in patients in whom coughing persists during anesthesia and in whom surface anesthesia fails and ether is contraindicated.

Retrolental Fibroplasia—Begg and Wilson briefly outline the history of retrolental fibroplasia and say that it is essentially a disease of the very small premature baby, being most frequently found in babies whose birth weight is under 3 lb (1,360 gm). They also call attention to its widely varying

incidence in different clinics and to its great frequency in centers which had modern equipment and gave very special care to these tiny premature infants. Many theories have been advanced to explain the cause, but each in turn has had to be discarded. On the other hand, recent work by Szweczyk of East Saint Louis and Ryan in Melbourne has shown that continuous prolonged oxygen therapy instituted early at high concentrations has proved a potent factor in the causation of the disease. The baby described here had been given far more oxygen than is usually administered at the service for premature infants at the hospital with which the authors are connected. All the features of established retrolental fibroplasia were present. Factors possibly predisposing to the development of the condition were the degree of prematurity and the duration and saturation of the oxygen therapy (though withdrawal was gradual). Complicating factors that may have played some part in the causation are the anemic state of the mother, the persistently low temperature of the baby during the first three weeks of life, the severe skin infection, and penicillin therapy. The outlook for the child's life is good but for her vision it is bad. She seems physically well and has no obvious congenital defect. She has developed well from the point of view of her intelligence and is emotionally quite normal. Unfortunately, by the time the diagnosis was made, the disease had reached an irreversible stage. Oxygen therapy, which is often life saving in the first 48 hours, should be given only to those premature infants who need it. If prolonged oxygen therapy is necessary, the eyes of the infant should be examined weekly by an ophthalmologist, especially during withdrawal of oxygen. He should guide the pediatrician regarding returning the baby to oxygen if eye changes have already taken place. The withdrawal must be gradual. The eyes of all babies whose birth weight is under 4 lb (1,814 gm) and who do not require oxygen should be examined by an ophthalmologist at least fortnightly until the end of the second month of life and again at the sixth month.

- *Potassium in Anuric Tubular Nephropathy M. Dérot, P. Pignard, R. L. Touraine and J. Bernard—p 207
- Epigastric Cramps Elicited by Effort in Patients with Gastroduodenal Ulcers Intermittent Claudication of Stomach P. Frumusan—p 209
- Basal Temperature in Women Important Diagnostic Factor E. Hurter—p 210

Potassium in Anuric Tubular Nephropathy.—The potassium content of the blood and urine of 13 women with anuric tubular nephropathy (due to septicemia after abortion in 12 and to apol poisoning in 1) was determined with an electrometer every second day. In seven additional patients with anuric nephropathy after abortion and in one with anuria after blood transfusion, potassium determinations in the blood and in the urine were made by chemical methods at more irregular intervals. All the patients were placed on a diet rich in carbohydrates (about 1,200 calories). Rehydration and rechlorination were based on daily laboratory determination. Catabolic control was exerted by administration of androgens. Exchange transfusions during the hemolytic phase or peritoneal dialysis with a standard solution free of potassium and magnesium were employed as extrarenal purification methods. In the initial period of anuria, before the institution of extrarenal purification, the potassium level remained within normal values (17 to 23 mg per 100 cc [4.3 to 5.8 mEq per liter]), while the nitrogenous products in the blood were increased. This phase was short, lasting three days on the average. In the phase of pure anuria the plasma potassium level increased roughly in proportion to the increase in azotemia. In 16 of the 21 patients, this increase occurred most frequently about the 18th day, varying from 23 to 45 mg per 100 cc (5.8 to 11.5 mEq per liter). This hyperpotassemia should be considered as a sign of cellular impairment. During the initial phase of reestablishment of urinary flow, the blood potassium level became stabilized, but within two or three days a very rapid drop in the potassium content of the blood was observed in 11 of

the 13 patients in whom determinations were performed regularly, a level below 15 mg per 100 cc (3.8 mEq per liter) resulted in 8 of the 13 patients. Hypopotassemia occurred in four patients who had not been subjected to extrarenal purification procedures. Hypopotassemia persisted during the convalescence period and restoration to normal was very slow. Hyperpotassemia occurring in patients with anuric tubular nephropathy is often a grave factor, when it exceeds 35 mg per 100 cc and particularly when it is associated with cardiovascular signs. It is one of the major indications for extrarenal purification, particularly for peritoneal dialysis. It requires regular determinations of the blood potassium level and careful observation of electrocardiographic changes. Hypopotassemia occurring at the time that diuresis is resumed raises difficult therapeutic problems. The patient should be placed rapidly on a diet containing less carbohydrates and more mineral elements rich in potassium. It seems that a rational alimentation is the only means of preventing postanuric hypopotassemia. Determinations of blood potassium levels in patients with anuric tubular nephropathies seem to be indispensable for the detection of those states of hyper- and hypopotassemia which act as aggravating factors in the course of these disorders.

Obstetrical Future of Hypertensive Women Subjected to Sympathectomy.—Lumbodorsal sympathectomy will enable many women with permanent arterial hypertension to under take or to continue pregnancy with safety. The procedure should be carried out before pregnancy if possible and should be advised only when a well-controlled hypertensive patient with a history of unsuccessful pregnancy insistently desires to have a child. The patient, who must be closely followed, should be placed on a strict salt free diet from the beginning, a satisfactory hormone balance should be maintained by the administration of progesterone or synthetic estrogens, and the blood pressure should be taken regularly so that bed rest can be instituted at the least sign of danger. Cesarean delivery shortly before normal term may be advised and will spare both mother and child the risks accompanying the last days of pregnancy and the severe ordeal of labor. The relief afforded by sympathectomy is temporary and the ultimate fate of the patient is uncertain; many women, however, can support high levels of hypertension for years. Sympathectomy may also be performed when necessary during pregnancy, but should not be undertaken unless the patient shows signs of severe vascular damage.

New Nontoxic Antibiotic in Treatment of Leprosy.—Tests of a new diazotized argentic sulfone (D₁ Atox argenticque Jeanson) in 15 patients with leprosy (Hansen's disease) proved its lack of toxicity and harmlessness to the hematopoietic centers. It does not produce either drug resistance or habituation on the part of the bacilli, and may therefore be administered as long as necessary. Most lesions responded rapidly to treatment, but some, which were poorly vascularized and sclerotic, did not begin to regress until the end of the second year. Continued treatment finally resulted in their complete disappearance. Adults may be given a dose of 0.20 gm a day (taken orally) to begin with, as the disease regresses, the dose may be reduced. Continuance of the treatment for two or three years after clinical cure was obtained prevented relapses.

The Heart in Chronic Pulmonary Disease—In 1950 and 1951 Fulton made the diagnosis of heart disease resulting from pulmonary disease in 129 patients during life. The diagnosis was based on clinical evidence, and did not entail demonstrable right ventricular hypertrophy. Seventy three patients died, and necropsy was performed on 58. The present account is confined to 50 pathologically verified cases. The pathological criteria for the diagnosis of chronic pulmonary disease with cardiac involvement were (1) bilateral chronic pulmonary disease, (2) absence of congenital, valvular, and ischemic heart disease, and (3) the presence of right and the absence of left ventricular hypertrophy. In the terminal stage two main groups of cases were recognized (1) congestive, in which right ventricular hypertrophy was considerable and death was due to congestive heart failure, and (2) anoxic, with slight right ventricular hypertrophy, little congestive failure and death from cerebral anoxia. Although right ventricular hypertrophy was less pronounced in the anoxic group, the amount of lung destruction was greater. It is suggested that this difference may be explained by a more rapid rate of progression of the lung disease in the anoxic group. About one fourth of the patients died from acute respiratory infection or other causes before differentiation into the congestive or anoxic pattern had taken place. "Chronic cor pulmonale" seems an unsatisfactory name because only one half of the patients with fatal uncomplicated chronic pulmonary disease died from congestive heart failure. The other half died from acute respiratory infection or from the chronic pulmonary disease itself, but were clinically indistinguishable from those with congestive failure until shortly before death. The term "pulmonary failure" might better describe the process. Early diagnosis is important, and more energetic treatment of acute bronchopulmonary infections, particularly with antibiotics, prolongs life. Fulton concludes that chronic pulmonary disease causes considerable morbidity and mortality in middle aged men, and he believes that atmospheric pollution is an important aggravating factor.

Cardiovascular System in the Elderly—The authors reviewed hospital records of 400 necropsies made on the cadavers of 200 men and 200 women who died between the ages of 60 and more than 85. Death was due to cardiovascular diseases in 94 patients (23.5%). Hypertensive cardiovascular disease with cardiac insufficiency and nephrosclerosis was present in 32 cases (34%), myocardial infarction in 14 (14.8%), and arteriosclerotic cardiopathy in 12 (12.8%). Signs of cardiac insufficiency were observed in 63 (67%) out of the 94 cadavers of patients who died of cardiovascular disease. Bacterial endocarditis was observed in six cases (1.5%), nonbacterial endocarditis in 50 (12.5%), pericarditis, either acute or chronic, in 11 (2.7%), aortic atheroma, mild, subacute or acute, in 265 (66.2%), coronary atheroma in 203 (50.7%), diffuse arteriosclerosis in 46 (11.5%), arteriolosclerosis in 114 (28.5%), and syphilitic mesoarteritis in 22 (5.5%). Aortitis coexisted with aortic insufficiency of the Hodgson's type in 49% of the cases

of mesoarteritis and aneurysm coexisted with aortitis in 27.3% of the cases of aortitis. Lesions of arteritis obliterans were observed in six cases (1.5%). The lesions complicated by dry gangrene were located in the legs of patients with acute arteriosclerosis. The authors conclude that arteriosclerosis and arteriolosclerosis are the most important etiological factors in the changes of the cardiovascular apparatus of the elderly. Hypertensive and arteriosclerotic heart disease are the most frequent cardiovascular diseases that cause death in the elderly.

- *Study on Controlled Hypotension J Rutkowski S Pokrzywnicki and J Hankiewicz—p 212
- Immunophagocytosis of Cell Elements in the Blood P Miescher—p 216

Surgical Treatment of Tuberculosis of Cervical Lymph Nodes—Radical surgical removal of tuberculous cervical lymph nodes with the scalpel or with the blunt-pointed Cooper scissors was performed by the authors on 221 patients. Of the 221 patients, 117 were children between the ages of 1 and 15, 72 were between the ages of 16 and 30, and 32 were over 30. Intratracheal anesthesia was used by one of the authors in children and adults, while the other employed local anesthesia in adults and nitrogen monoxide and ether anesthesia by intubation in children. Immediate operative results were good in all patients. There were no secondary injuries or post-operative dissemination. Of 167 patients who could be followed up for periods varying from three months to 10 years (with an average of three years and four months), 9 (5.5%) had recurrences, consisting of bean sized, nonfistulizing lymph nodes in the scar area. Of 130 patients in whom the cosmetic results were ascertained, 99 (76%) had excellent results, 27 (21%) had satisfactory results, and only 4 (3%) had large adherent scars. Of the 167 patients who had been followed up, 54 had been subjected to tonsillectomy before the surgical removal of the cervical lymph nodes, of the nine patients who had recurrent tuberculous cervical lymph nodes eight had had their tonsils removed. Tonsillectomy, therefore, does not prevent recurrences and has no influence on the incidence of recurrences. As a result of their experiences the authors state that conservative methods of treatment for tuberculous cervical lymph nodes are time-consuming and results have proved unsatisfactory. On the contrary, radical surgical removal, although technically difficult, proved highly effective in that rapid and definite healing resulted in a large percentage of cases. Surgical treatment is indicated (1) in solid lymph nodes with out necrosis in which suppuration may no longer be expected and which are usually cherry sized, (2) in fluctuating lymph nodes with the skin still intact (surgical intervention should be performed before scrofuloderma develops), (3) in fistulous and occasionally already calcified lymph nodes with not too extensive cutaneous changes, so that healing of skin by first intention may still be possible. Infected lymph nodes with large subcutaneous abscesses in which healing by primary intention is no longer possible and extensive bilateral processes should not be operated on. Lesions of recent origin may be operated on more easily than older ones. The risk of recurrence is greater in patients with recent lesions, who therefore should receive postoperative sanatorium treatment for several months, while extirpation alone may be sufficient for older lesions.

Controlled Hypotension—The ganglion blocking preparation Pendiomid (N,N,N'-N'-3-pentamethyl-N,N'-diethyl-3-azapentane 1,5-diammonium dibromide) was employed to produce controlled hypotension and thus to reduce bleeding in 25 women and 35 men between the ages of 16 and 75 who underwent a variety of operations such as pulmomectomy, lobectomy, thoracophrenectomy, thoracoplasty, thyroidectomy, cholecystectomy, sigmoidectomy, prostatectomy, nephrectomy, and cystectomy. General anesthesia was induced by thiopental sodium or hexobarbital sodium and nitrogen monoxide with

oxygen Curare was used for control of respiration in interventions on the thorax, and free respiratory passage was secured by intubation. The ganglion blocking agent in small doses diluted in isotonic sodium chloride solution (with an average total dose of 150 mg) was injected intravenously, and the blood pressure was measured every three minutes. Surgical intervention began when the systolic blood pressure had reached 60 to 70 mm. Hg. In 24 patients the blood pressure dropped below 60 mm Hg. In 19 of these 24 patients, an average "pause" of 10 to 15 minutes occurred, during which the blood pressure could no longer be measured by auscultation but only by oscillations. In 17 of these 19 patients the pulse of the radial artery disappeared simultaneously, but despite general pallor, the hands and the face remained warm. Cyanosis was never observed. In the stage of the lowest hypotension the patients were completely conscious. The Pendiomid did not exert any effect on the respiration, which remained spontaneous and quiet, with about 20 respirations per minute. The rise of blood pressure after the operation was slow and regular, within 10 hours blood pressure was restored to its initial values. Dilatation of the pupils was restored to normal within six to eight hours. Pressor drugs were not required in any of the authors' patients, but replacement of even small losses of blood is indispensable with induced hypotension. Almost no blood loss occurred in the course of the surgical intervention, making large blood transfusions unnecessary. The operative field could be surveyed easily, and the number of blood vessels requiring ligation was small, thus the operations could be performed rapidly. The amount of general anesthetics used was small because of the reduced metabolism, and consequently the patient recovered consciousness rapidly. Blocking of the ganglions of the sympathetic and parasympathetic nervous systems prevented disturbing reflexes. The postoperative general condition of the patients was much better than that of patients in whom hypotension had not been induced. Secondary hemorrhages did not occur since blood coagulation was unchanged. Without previous elimination of the cerebral cortical influence by general anesthesia, hypotension cannot be induced easily. Intubation and adequate administration of oxygen are of primary importance for making the method safe. The technique of controlled hypotension is advantageous for the patient and convenient for the surgeon and is suited particularly for operations in which large losses of blood may be expected.

*Transfusions of Red Cells Without Plasma Their Role in Treatment of Anemias P. Cazal —p 789

Disturbances of Auriculo-Ventricular Conduction in Angina Pectoris and Myocardial Infarct R. Vialard —p 793

Transfusion of Red Cells Without Plasma in Treatment of Anemia—Transfusions of whole blood are contraindicated for patients with cardiac and renal conditions in whom the increased volume of fluid may lead to circulatory complications. Transfusions of red cell suspensions will provide these patients with twice as many red cells in the same amount of fluid. Patients with paroxysmal nocturnal hemoglobinuria (Marschafava-Micheli syndrome) are often benefited by transfusions of red cells that have been washed to remove all traces of complement. Various types of anemia may be treated with transfusions of either whole blood or red cells, but the use of red cell suspensions may be more advantageous both to the recipient and to the transfusion center in many cases. Iron deficiency anemias in particular respond quickly to red cell transfusions, when the transfused cells disappear from the circulation, their iron is metabolized and used in the synthesis of new hemoglobin. A single transfusion supplying all the red cells needed by the patient may be considered curative, whereas treatment with iron requires time to become effective. Posthemorrhagic and aplastic anemias, anemias resulting from leukemia, certain constitutional hemolytic anemias, megaloblastic anemias, and secondary anemias are all benefited by transfusion of red cell suspensions. Utilization of red cells by

the transfusion center saves blood and virtually doubles the number of transfusions that can be given without increasing the number of donors. Both the patient and the center profit financially by the saving.

Vulval Condyloma Accuminata as Premalignant Lesion in the Bantu G. P. Charlewood and S. Shippel —p 149

*Paralytic Ileus Due to Potassium Depletion S. Grieve —p 153

Anaemia in Obstetrics J. Miller —p 155

Paralytic Ileus Due to Potassium Depletion—In studies of electrolyte balance numerous symptoms and signs have been attributed to either hypokalemia or hyperkalemia. One of the syndromes ascribed to hypokalemia is paralytic ileus. This paper reports two cases of paralytic ileus in which the etiological factor was thought to be hypokalemia. Some investigators have demonstrated the coexistence of intracellular potassium deficiency, metabolic acidosis, and hypochloremia. This state occurs in the presence of normal renal function when there is loss of a single ion such as chlorides or potassium. Numerous authors have stressed the importance of hypochloremia. It does not respond to the usual therapy, being associated with hypokalemia, particularly in postoperative states. The first case described exemplifies this biochemical state. The woman was admitted in a state of gross malnutrition, with chloride and potassium but not sodium deficiency, and her carbon dioxide combining power was high. The paralytic ileus responded well to oral administration of potassium in spite of the fact that her intestinal mucosal absorption might have been deficient and that she had vomiting and diarrhea. The second woman, although showing hypochloremia and hypokalemia, was acidotic and had a normal sodium value in her blood. Renal damage was probably responsible for this, although no retention of urea or other substances occurred until the final stages of the disease. In this case the paralytic ileus responded well to intravenous administration of potassium chloride, although there was concern about accumulation in the presence of gross kidney damage. Oral administration of potassium chloride in doses of from 6 to 18 gm daily has been recommended for the treatment of hypokalemia. This can be given in a glass of milk and should produce no untoward effects if the renal function is normal. When potassium chloride is given intravenously, it is added to the intravenous fluid (dextrose in isotonic sodium chloride solution), 0.26 gm of potassium chloride per kilogram of body weight (18 gm for a patient weighing 70 kg) may be given in eight hours. In both of the patients described here electrocardiography and serum potassium evaluations were done serially. The return of flattened ST segments and T waves to normal indicates adequate therapy, whereas the appearance of spiked T waves is thought to be the first indication of hyperkalemia.

Spinal Lesion as First Sign of Leukemia J. Agerholm-Christensen —p 91

Corticotropin Treatment of Cutaneous Diseases—In Reymann and Sjøbye's opinion the field of indication for corticotropin (ACTH) in dermatology at present includes certain allergic diseases, the pemphigus group, certain erythrodermas (psoriasis, pityriasis simplex), and perhaps lichen ruber. The various drug eruptions constitute an important field of indication. Corticotropin is not indicated in prurigo Besnier and apparently not in pemphigus foliaceus or dermatitis herpetiformis, and is believed to be contraindicated in treatment of burns. The authors advise restriction of treatment with corticotropin to serious disorders where other therapy is without effect. Pos

sible contraindications must be considered in every case, such as psychic disorders, diabetes mellitus and gastric ulcers, and the patients must be observed during treatment for possible complications. Attention is called to the lowering of resistance of the organism to infection in connection with the treatment.

- Medicaments with Cortisone Like Effect P. Wedel—p 173

Local Treatment of Cutaneous Infections with Neomycin and Bacitracin.—Seventy-four patients with various stubborn skin infections were treated with Nebacelin ointment containing 5 mg of neomycin and 250 units of bacitracin per gram of ointment base consisting of petrolatum and 10% lanolin. Bacteriological examinations were performed in 34 cases, with determination of resistance in 26. The bacteria oftenest met with were staphylococci. All strains isolated were highly susceptible to the combination of neomycin and bacitracin. The effect was satisfactory in 73% of the cases treated and slight in 14.9%. The infection remained unchanged in 6.8% and in 5.4% was aggravated by irritation from the ointment base. The most frequently treated disorder was eczema, where the ointment proved effective in 27 out of 32 cases. No sensitization was seen in spite of long-continued treatment in some cases.

Preliminary Results of Prolonged Treatment of Rheumatoid Arthritis with Corticotropin and Cortisone.—Prolonged treatment with cortisone orally was given to 40 patients, 12 men and 28 women. Thirty-five had true rheumatoid arthritis, four ankylosing spondylarthritis, and one psoriatic polyarthritis, all in the active stage, with all degrees of functional defect and deformity represented. The treatment was always started during hospitalization, after observation for some time. Large doses were given, in order to suppress symptoms as far as possible. Then the dose was gradually and slowly reduced until the lowest dose was established that was capable of maintaining a satisfactory remission. The maintenance dose was on the average not quite 50 mg of cortisone daily, no patient received more than 75 mg daily, and only three received this dosage. The aim was not to secure full remission if the dosage had to be over 75 mg daily. In 30 cases the treatment was begun with corticotropin and in 10 with cortisone. In the former cortisone was gradually substituted for corticotropin. Most of the patients received the same maintenance dose throughout the treatment, but in 11 cases it was necessary from time to time to regulate the dosage because of aggravation of symptoms due to flare up of the disease, intercurrent infections, or increased physical activity. The shortest observation period during maintenance treatment was 100 days, over half of the patients were observed for more than half a year and three for more than a year. The result was good in 33 cases and not satisfactory in 7. At the start of treatment only 7 patients were able to manage their usual work, on discharge the number was 29, and 26 kept their ability to work during the observation period. Good results were obtained even in older patients and in cases of long standing, but the best results were in younger patients and in cases of short duration. The poorest results appeared in women during and after the menopause. The treatment never had to be discontinued because of side-effects. In 16 cases no side-effects occurred. In three cases moderate and transient flare up of symptoms of duodenal ulcer were seen, the only other side-effects were a moderate gain in weight, increased rounding of the face, and transient edema. No reduction of resistance to infection was noted.

Prolonged Treatment of Rheumatoid Arthritis with Corticotropin and Cortisone.—In the Rigshospital 15 men and 36 women with rheumatoid arthritis, aged between 30 and 50 were treated with corticotropin and cortisone for from 1 month to 28 months, 20 were treated for more than six months, and three for more than two years. The average duration of the disease at the start of treatment was 6.3 years. All stages of arthritis were represented. The treatment was begun during hospitalization with prolonged treatment in view. In all cases corticotropin was given at the outset, in 32 cases this was followed after three days by cortisone, while in 19 corticotropin therapy was continued for up to two months. The aim was to maintain the initial effect with as small doses as possible, depending on the patient's tolerance and symptoms. For various reasons the treatment had to be discontinued in eight cases, in three cases it was terminated because of remissions which have now lasted for from three to six months, and 40 patients are still under treatment. According to the criteria of the American Rheumatic Association, the effect of the prolonged treatment was good in 37 cases, slight in 8, and negative in 6. The side-effects seen in almost all cases were usually only an expression of the induced hypercorticism. There were no serious side-effects. Fischer and Bröchner-Mortensen conclude that the treatment is of practical value in the therapeutic management of selected cases of rheumatoid arthritis. Because of the danger of complications, the patients must be selected with careful attention to indications and contraindications and must be closely observed during the entire time of treatment. Active infections, especially tuberculosis, peptic ulcer, hypertension and cardiac and renal disease, are contraindications. In patients with emotional instability and severe neuroses symptoms are often aggravated during the treatment, and an existing osteoporosis may be increased. For the time being conservatism seems advisable in using corticotropin and cortisone at the start of pregnancy. Evaluation of the clinical effect and the side-effects must determine whether the treatment is to be continued. As a rule, it should be introduced only when continuation as a prolonged treatment seems possible.

- Pseudarthrosis of Internal Malleolus G. Bertele—p 20
- Rare Fat Embolism of Pulmonary and Systemic Circulation W. Förster—p 24

Osteitis Pubis.—Millin's method of retropubic prostatectomy has become the most widely practiced technique because of its definite advantages over other methods of prostatectomy, but unfortunately it has increased the incidence of osteitis pubis. Götz and Boemlinghaus present the histories of four patients with osteitis pubis observed at their own clinic, and report 39 additional cases of osteitis pubis among 2,635 patients who had undergone prostatectomy in other clinics, an incidence of 1.48%. Pain is the most important symptom, and it is particularly intense during movements. After discussing the roentgenologic and histological aspects, the authors comment on the treatment, which is mostly symptomatic. Although the symptoms may persist for weeks or months, the process usually subsides spontaneously. The etiology has not been completely explained, but these authors agree with those investigators who assume an infectious etiology. The presence of increased temperature suggests an inflammatory process induced by an organism of low virulence. The rather long incubation period, the leukocytosis, and the increased erythrocyte sedimentation rate are additional evidence for such an infection, but the authors feel that trauma and a vasoneurotrophic disorder are other factors involved in the etiology of osteitis pubis. They believe that trauma is the most important causal factor, and for this reason they stress the need of extreme gentleness in the detachment of the bladder and of the anterior surface of the prostate, that is, during the exposure of the retropubic space. They also now prefer Pfannenstiel's to other types of incision, because in this way damage to the symphysis and to the periosteum of the pelvic bones is avoided.

BOOK REVIEWS

Treatment of Mental Disorder By Leo Alexander M.D., Director Neurobiological Unit Division of Psychiatric Research Boston State Hospital Boston. Cloth \$10 Pp 507 with 143 illustrations. W B Saunders Company 218 W Washington Sq Philadelphia 5, 7 Grape St., Shaftesbury Ave, London W C.2 1953

In discussing the major approaches to the treatment of mental illness, the author states that "there is a great deal of evidence that mental disease is merely an example of a specific organ choice, namely, of the central nervous system, in a psychosomatic illness. This view may be further supported by the well-established observation that mental disease may alternate with other psychosomatic illnesses, such as ulcerative colitis and asthma. Certain basic personality patterns of psychotic and psychosomatic patients are similar, especially the rigidity of the defenses during the healthy intervals."

Throughout this comprehensive textbook, the author stresses the importance of physical methods of treatment, which he believes are often overlooked by those whose approach to the treatment of mental disorder is completely psychological. The book is of special value to psychiatrists working in mental hospitals because of the attention given to all details of electrical, chemical, and surgical therapy, and the careful documentation of references at the end of each chapter. A considerable portion of the book is devoted to practical treatment techniques, the combining of psychotherapy and physical treatment, the role of the nurse during treatment, and the treatment of various states of intoxication of external origin. This volume is recommended as a valuable reference book not only for residents in psychiatry, but for all psychiatrists.

Human Parasites and Parasitic Diseases for Students, Laboratory Workers, Practitioners of Medicine and Public Health. By K. D. Chatterjee M.D., Visiting Physician R.G. Kar Medical College Belgachia Calcutta. Cloth. \$16.75 6 £ Pp 766 with 328 illustrations. The Author 6 Amrita Banerjee Rd. Kalighat, Calcutta 26 [distributed by Messrs. Das Gupta & Co. Ltd. 54/3 College St. Calcutta 12] 1952

This textbook on Protozoa and helminths and the diseases they produce in humans was first conceived by the author in 1935 to meet the need for a comprehensive treatise on parasitological medicine. In the foreword Col. H. E. Shortt, I.M.S. (Retired), director of the department of parasitology, London School of Hygiene and Tropical Medicine, comments on the competency of the author, the completeness and up-to-date-ness of the volume, and the number of excellent illustrations.

The treatise has 12 chapters and a subject index. Many relevant references are found at the end of chapters 3 through 12. The first chapter contains an introduction to parasitology, technical terminology, the epidemiology and pathogenesis of animal parasites, laboratory diagnosis, and brief therapeutic and prophylactic considerations. One chapter describes and classifies the parasitic Protozoa of man. Another is devoted to thorough consideration of the amebas found in man, with emphasis on the pathogenesis and clinical features of amebiasis. Chapter 4 considers intestinal flagellates, presents comprehensive information on African trypanosomiasis and Chagas' disease, and takes up the three clinical types of leishmaniasis, with monographic treatment of kala azar, a prevalent disease in India. Even more expanded treatment is given to Plasmodium and to malaria, which is the greatest single cause of death in India. One chapter discusses blackwater fever. A description of *Balantidium coli* concludes the section on Protozoa. Chapter 8 is an introduction to the parasitic worms, including classification, historical landmarks, development of anthelmintic medication, and diagnostic procedures. Other chapters contain valuable information on roundworms, tapeworms, the trematodes, and anthelmintics. The terminology and classification are those generally accepted by parasitologists, but most readers will take exception to the grouping of all parasitic worms under one phylum.

The most striking feature of the book is the wealth of original illustrative material, including diagrams of life cycles and detailed morphological characters of parasites, photographs, roentgenograms, photomicrographs, and fair color reproductions of pathological changes caused by the parasites, as well as stages useful in laboratory diagnosis. The illustrations are enhanced by the excellent quality of the paper. The volume has a pleasing format, the type is clean, and typographic errors are few. The binding is probably not substantial enough to withstand hard use.

The book emphasizes parasitic diseases of major clinical importance in India, such as amebiasis, kala azar, malaria, hookworm disease, and Bancroft's filariasis. Medical entomology is considered only insofar as arthropods are biological vectors of protozoan and helminthic agents. The one serious defect is the inadequate presentation of the public health aspects of parasitic infections. Dr. Chatterjee is to be congratulated for this comprehensive, authoritative contribution to the literature on parasites. His text should have wide acceptance.

Synovial Fluid Changes in Joint Disease By Marian W. Ropes M.D., Associate Physician Massachusetts General Hospital Boston, and Walter Bauer M.D., Chief of Medical Services Massachusetts General Hospital. Cloth. \$4 Pp 150 with 15 illustrations. Published for Commonwealth Fund by Harvard University Press Cambridge 38 Mass. Oxford University Press Amen House, Warwick Sq. London E.C.4 1953

This little monograph presents the authors' 20 years of experience with articular anatomy, physiology, and pathology. The book begins with a discussion of normal articular fluid. Much of the work presented was done on cattle, but the findings are apparently comparable to those in fluid recovered post mortem from human joints. The second chapter presents a general analysis of the variations that can occur in pathological states. The comprehensiveness of this section is reflected in its subheadings: pressure, amount and gross appearance of fluid, bacteriology, cytology, proteins, electrolytes, nonelectrolytes (including sugar, lactate, lipids, and cholesterol), enzymes, and mucin. On the basis of these studies, the authors divide abnormal joint fluids into two main groups: those characteristic of diseases of traumatic origin and those found in rheumatoid arthritis and diseases of infectious origin. In chapters 3 and 5 these two groups are discussed in detail and in relation to specific disease entities, whereas chapter 4 concerns fluids that resemble both groups. A tremendous amount of factual information is included, and the book is illustrated with photographs, tables, and charts, some of which are difficult to understand. Whether the facts justify all the conclusions drawn by the authors as to the clinical value of the various examinations may be questionable, but the book is undoubtedly valuable to the student of articular physiology and pathology.

Operative Thorakoskopie Von Primarius Dr. Stanko Dujmušić. Aus dem Kroatischen übersetzt von Mag. pharm. und Dr. med. Rudolf Herr, Facharzt für innere Erkrankungen Wien. Cloth \$11.50 Pp 222 with 204 illustrations. Verlag für medizinische Wissenschaften Wilhelm Maukisch Alserstr. 19 Wien VIII/65 Düsseldorf 1953

This monograph on operative thoracoscopy is timely and well written. Although the field is narrowed to a specific procedure, the many facets of the subject are adequately presented. The types of pleural adhesions and their relation to thoracoscopy are discussed. Adhesions are clearly depicted in both illustrations and text, and a picture of each is included. The use of green, red, and black coloring (figures 52 and 53) in the illustration of a new operating thoracoscope is commendable. Figures 10 and 11, left and right views of the upper mediastinum, are excellent. To give a third dimensional effect, the figures are drawn so that the view is upward into the chest from below, with just enough obliquity so that both the upper mediastinum and the thoracic inlet are clearly visible. The color in these illustrations is of a good quality. Numerous roentgenograms amplify the text. The book is recommended to anyone with a good reading knowledge of German interested in chest diseases and, particularly, operative thoracoscopy.

Monographs in Medicine: Series 1. Editors William B. Bean, M.D. Professor and Head of Department of Medicine, State University of Iowa Iowa City Associate editors Morton Hamburger M.D. Associate Professor of Medicine University of Cincinnati School of Medicine Cincinnati John A. Leutscher Jr. M.D. Associate Professor of Medicine Stanford University School of Medicine San Francisco and Stewart Wolf M.D. Professor and Head of Department of Medicine University of Oklahoma School of Medicine Oklahoma City Cloth. \$12. Pp 655 with illustrations Williams & Wilkins Company, Mount Royal and Guilford Aves. Baltimore 2, 1952.

With this book a new series of medical monographs is begun. Monographs serve a need in medical literature not filled by any other form. They review and orient at a pace slow enough to be highly readable in comparison to many journal articles, and thus makes them informative rather than only documentary. At the same time they do not exhaust the reader's patience as a forbiddingly long and detailed book might. The editors are to be congratulated on the excellence of the initial selections, which vary from a most serious article on respiratory failure to the rare discussion on loud precordial noises. Other general subjects include body fluids, angiocardiology, portal hypertension, pheochromocytoma, sickle cell anemia, growth of erythrocytes, and an interesting essay called "Talking with the Patient." Infections and chemotherapy are considered in sections on cortisone and infection, rheumatic fever, amebiasis, malaria, encephalitis, and antineoplastic chemotherapy. This series takes a place somewhat between the more detailed monographs in the series *Recent Advances in Internal Medicine* and the somewhat less detailed but more comprehensive *Annual Review of Medicine*. Like these, it is certain to be welcomed by intelligent readers and to serve them well.

Atlante di citodiagnostica del carcinoma dell'utero. Dal Dr. Enzo Martella. Prefazione del Prof. G. Tesauro. Cloth. Pp 24. 27 plates. Casa editrice V. Idelson di E. Gnocchi e F. E. de Marinis. 19 Naples. 612, 1952.

This atlas originated in the obstetric and gynecologic clinic of the University of Naples, where the Papanicolaou vaginal smear method has been intensively studied during the past two years. The seven brief sections are devoted to various techniques for obtaining vaginal and cervical smears, an explanation of the morphology of the different exfoliated cells in the female genital tract, the morphology of inflammatory elements, the general criteria of malignancy, the morphology of the exfoliated cells in carcinoma of the cervix and endometrium, causes of error in cytological studies, and the value of the cytological method in diagnosis of cancer of the uterus. There is a well selected bibliography at the end of the text. The main part of the book, however, consists of 27 plates illustrating normal and pathological cells. For those who cannot read Papanicolaou and Traut's or Ayre's book on the same subject but can read Italian, this book is highly recommended for its exposition of cytodiagnosis of cancer of the uterus.

Pathologie du pied: Physiologie, clinique, traitement médical, orthopédique et chirurgical. Par Jean Lellèvre, chef de Clinique chirurgicale à la Faculté de médecine de Paris. Préface du Dr. Merle d'Aubigné. Paper. 4500 francs. Pp 585 with 518 illustrations. Masson & Cie. 129 boulevard Saint-Germain. Paris. 6^e 1952.

The author has done considerable research and clinical work. His book includes chapters on the prehistoric foot, the physiology, architecture, and roentgenographic aspects of normal and abnormal feet, supernumerary and sesamoid bones, the mechanics of lines of force, the dynamics of the foot, including its movements, the physiology of bones and joints, normal and abnormal gait, a critical study of shoes and the modifications of shoes, prostheses, and arch supports, congenital malformations of the foot, flat feet of various types, metatarsus varus, and surgery for the residual effects of infantile paralysis.

There are also chapters on fractures in and around the ankle and foot, subastragalar dislocations, malunited fracture of the ankle, fractures of the bones of the feet, rupture of the achilles tendon, pes cavus, painful flat feet, rachitic feet, bow legs and knock knees, tarsal scaphoiditis, epiphysitis and apophysitis, hallux valgus, hammer toes, hallux varus, hallux rigidus, exostoses, arthropathy, arthritis, tumors of the bones, gout and infections, synovitis, rare diseases, vascular and circulatory disorders, bursitis, tumors of the soft tissues, minor

disorders of the feet such as hyperostosis, and plantar warts and disorders of the toenails. There is a very good chapter on surgical technique. The author recommends the technique of Dr. Merle d'Aubigné for osteotomies, extra articular stabilization of the ankle, tarsectomy, tendon transplants, amputations, and plastic operations.

There are many illustrative line drawings. The bibliography is large and fairly up-to-date.

Food-Borne Infections and Intoxications. By Fred W. Tanner. Ph.D. D.Sc. and Louise P. Tanner. Ph.D. Second edition. Cloth. \$12. Pp 769. Garrard Press Publishers. Champaign Ill. 1953.

This reference book deals with sanitation problems, food-borne diseases, and food poisoning caused by bacterial toxins and by metals. It is a supplement to the discussions in the authors' "Microbiology of Foods," published in 1944. The format is good, there are relatively few typographic errors, and a good index is included. A comprehensive review of the literature is presented indiscriminately, leaving the reader to draw his own conclusions. The evidence obtained from human feeding experiments with heat-killed cultures of *Salmonella* has failed to support the theory that heat-stable toxins of *Salmonella* may cause illness when eaten by man. In spite of this the authors consider heat-stable products of *Salmonella* a cause of illness in man. The book is useful as a historical review of the literature but is not too valuable for the clinician.

Clinical Allergy. By French K. Hansel. M.D. M.S. Director. Hansel Foundation for Education and Research in Allergy. St. Louis. Cloth. \$17.50. Pp 1005 with 89 illustrations. C.V. Mosby Company. 3207 Washington Blvd. St. Louis 3. 1953.

This general text on allergy covers practically all aspects of the subject. The portions of the book dealing with asthma, problems in internal medicine and dermatoses are handled well, but the material seems to be mainly quoted from other workers. The sections on rhinological conditions, which are the result of the author's large experience, constitute the best feature of the volume. Unfortunately, a number of unconfirmed concepts are stressed, such as extremely small, desensitizing doses, sublingual antigen therapy, *Staphylococcus* toxoid, and the empirical use of house dust in asthma. The book will be useful to the expert but may be misleading to those who have only a moderate knowledge of clinical allergy.

Handbook of Dangerous Materials. By N. Irving Sax. Toxicologist, General Electric Co. Schenectady N.Y. Assisted by M. J. O'Herin and W. W. Schultz. Cloth. \$15. Pp 848 with illustrations. Reinhold Publishing Corporation, 330 W. 42d St. New York 18. 1951.

This book contains an enormous amount of information on the hazardous properties of more than 5,000 compounds and chemical formulations. It presents the chemical formulas, physical properties, toxicity, symptoms, antidotes, and methods of handling the compounds in a concise, summary form. In addition, the book contains sections on explosives, fungus diseases and fungicides, and radiation and radiation hazards, as well as complete shipping regulations for various chemical compounds. It is the most complete reference book available to date on general toxicology. The organization and careful indexing of the book make the large amount of information readily accessible. This handbook is a valuable reference for industrial physicians, toxicologists, industrial health engineers, and plant superintendents.

A Bladder and Bowel Training Program for Patients with Spinal Cord Disease. By Edith Buchwald. M.A. A.R.P.T. Margaret McCormack, R.N. and Emille Raby. R.N. Rehabilitation monograph III. Acknowledgement is made to United Mine Workers of America Welfare and Retirement Fund for their assistance in preparation and publication of this monograph. Paper. \$1. Pp 35 with 12 illustrations. Institute of Physical Medicine and Rehabilitation, New York University—Bellevue Medical Center. 400 E. 34th St. New York 16. 1952.

This "rehabilitation monograph" is a brief, simple presentation that discusses bladder training, bowel training, aids used in attending to toilet needs, examples of bladder routines, case studies, and organizational procedures used in expediting the training program. The monograph is of interest to nurses caring for patients with bladder and bowel incontinence and to the patients themselves.

TO THE EDITOR—A 20 year-old man first noticed warts at age 15, and they have progressed until, at present, he has 160 warts on his hands, some 4 to 5 cm in diameter with a 1 cm elevation, and about 500 scattered over his forearms, legs, and feet. He has tried oxytetracycline (Terramycin) and vitamin A in heavy doses, without success. Fulguration seems to make them recur in greater numbers. I was told that a vaccine has been used successfully for treatment of warts in dogs and cattle. Please comment.

Paul L. Bradley, M.D., Dalton, Ga.

ANSWER—The case described is so unusual that a biopsy should be performed to substantiate the diagnosis of common warts. Warts are strange in their behavior. They have been known to disappear spontaneously without treatment, and they have sometimes been extremely obstinate to all forms of therapy. Warts have been treated internally, externally, and psychotherapeutically, with varying results. Among the internal remedies that have been used are bismuth sodium triglycolamate (Bistramate), bismuth subsalicylate injection, protiodide of mercury, arsenic, dilute hydrochloric acid, magnesium sulfate, oxytetracycline, aureomycin, and chloramphenicol. There have been reports of successful treatment of warts by suggestive therapy. On the basis of experimental studies and statistics, Bruno Block and others have gone so far as to recommend this as the method of choice in the management of verrucae. This therapeutic regimen consists of verbal suggestions combined with such procedures as painting the warts with eosin, giving injections of isotonic sodium chloride solution, or giving placebo doses of roentgen rays. This consultant has not been able to corroborate these results. Immunologic therapy, often effective in treating cattle, is of questionable value in human infections. Some believe the good results observed are due to suggestive therapy. Biberstein (*Arch Dermat & Syph* 50 6, 1944) is reported to have cured between 75% and 80% of 139 cases with wart vaccine. The following technique is used in preparing the autolysate vaccine. The warts are surgically removed, with 1% procaine (Novocaine) as a local anesthetic, and cut into small pieces. They are then ground in a mortar with two or three parts of isotonic sodium chloride solution until a pulpy consistency results. The mixture is allowed to stand at room temperature for 24 hours and then passed through a Berkefeld filter. The filtrate is then sterilized for two hours in a water bath at 56 to 60 C, and phenol is added to make a 0.5% solution. The vaccine is given twice weekly subcutaneously in doses of 0.2 to 0.4 cc for a total of 2 to 30 subcutaneous injections, as indicated. The best form of treatment is to destroy the warts and their roots by electrodesiccation using a local anesthetic. As warts are due to a virus and are autoinoculable, the patient should come in for examination at periodic intervals until there is a discontinuance of the occurrence of new ones.

TO THE EDITOR—I should appreciate information on the current treatment of *Strongyloides stercoralis* infection.

Glenn T. Howard, M.D., Alice, Texas

ANSWER—The treatment for strongyloidiasis is not entirely satisfactory. Eradication is difficult, because parasites multiply within the body by hyperinfection and superinfection. The adults are found in the intestinal wall while the larvae circulate in the blood stream and take the route through the right heart to the capillaries of the lungs. Treatment must be directed

toward both adults and larvae in the various locations in the body. Enteric-coated, medicinal methylosaniline chloride (gentian violet) for oral use affects worms only in the gastrointestinal tract. Faust recommends use of 0.06 gm three times daily before meals for 7 to 10 days. One week of rest is followed by a second course of enteric-coated methylosaniline chloride. The interval between courses allows the larvae in the blood and lungs to reach the gastrointestinal tract. If the tablets are old or the bowels hyperactive, the enteric coating may be dissolved too low in the gastrointestinal tract to affect the adult worms. To make sure the drug comes in contact with the worm, it may be administered by duodenal tube, using 25 ml of a 1% aqueous solution. Sometimes there are foci of parasites outside the gastrointestinal tract. For these methylosaniline chloride has been given intravenously. The dose is 10 to 25 ml of a 0.5% solution given on alternate days for a period not exceeding 10 days. During and after the treatment the patient should try to avoid reinfection by preventing constipation and by cleansing the perianal area frequently, especially after evacuation of the bowels. In this way the filariform larvae will be prevented from entering the mucosa of the colon or the skin around the anus.

Methylosaniline chloride is contraindicated in pregnancy and nephritis. It is a mild cardiac stimulant and is slightly irritating to the mucosa. Treatment should be discontinued temporarily if the urine becomes blue or if nausea and vomiting become a problem. If the drug is given intravenously or by duodenal tube, the patient should be hospitalized and given personal supervision. After treatment the worms die slowly, and larvae are found in the stool for a long time.

TO THE EDITOR—During a tonsillectomy in an adult under general anesthesia there was severe hemorrhage. About two and a half hours was required to control the bleeding and even then a sponge had to be sutured in the right fossa for hemostasis on that side. During the procedure, a needle broke off and lodged in the superior pole of the right fossa. This was demonstrated roentgenographically. What would be the medicolegal status of this case if the needle were left in indefinitely? The patient and his wife were advised that the needle was in the throat. If the needle should be removed how soon should it be done? It was not done at the time of the tonsillectomy because of the severe bleeding.

M.D., Pennsylvania

This inquiry was referred to two consultants, whose respective replies follow.—ED

ANSWER—A needle located near the great blood vessels of the neck constitutes a potential threat to the patient and should be removed as early as possible. The sooner the problem is attacked, the greater the chances for successful removal. Tamarin and Bergendahl (*Eye, Ear Nose & Throat Month* 31 196, 1952) report favorably on the merits of the Berman metal locator, which, when passed over the area adjacent to the foreign body, will respond with a signal if the object is magnetizable. The locator itself does not possess a magnetic field for extracting the foreign body, its function is merely to detect and localize. Following localization, an exploring forceps is inserted into the tissues until the tip reaches the depth of the foreign body, and the needle is grasped. It may then be twisted until one end is brought into view and seized with another forceps. As an alternative procedure, after the needle has been fixed with the forceps, the operator may dissect until the needle is exposed.

ANSWER—Medicolegal abstracts of court decisions based on alleged negligence in leaving foreign substances in patients' bodies have appeared in THE JOURNAL from time to time. Almost unanimously, they support the rule of law that a physician, in the treatment of a patient or the conduct of an

operation, must possess and exercise that degree of skill and care possessed and exercised by doctors of his school of practice, in the same or in a similar community, and in like practice, having due regard for the condition of the patient and the progress of medical or surgical science at the time. In order to establish want of care or skill, it is necessary to establish what is good medical or surgical practice by competent medical testimony. An exception obtains when there is manifest such obvious gross want of care or skill as to afford of itself an almost conclusive inference of negligence, thus dispensing the necessity of testimony by expert witnesses. Departure from good medical or surgical practice, i. e., failure to possess or exercise the requisite degree of skill of care, the proximate result of which is injury to the patient, constitutes an actionable wrong. Whether to remove a foreign substance from the body or leave it in indefinitely depends, then, on every medical aspect of the case. It is a diagnosis calling for the same degree of skill and care as any other diagnosis, and the responsibility or liability of the physician is likewise the same.

MEASLES IN INFANTS

TO THE EDITOR—*Is it possible for a 1-month-old infant, born of a mother who has had measles (rubeola), to have measles after adequate exposure? What would be the clinical manifestations of the disease at this age? What would be the chances of this infant's contracting rubella (German measles) if exposed? What is the youngest age an infant may have exanthema subitum (roseola infantilis)?*

Edward S King M.D., Shelby, N C

ANSWER—It is believed that if a mother has had measles her child will be immune at birth. Such immunity is generally considered effective for the first five months of life. The nasal passages of infants in the first few months of life have been swabbed with nasal washings from measles patients without producing clinical measles (Herrman, 1915). Measles has, however, been diagnosed, though uncommonly, at age 3 months. In reality, measles is rare before 6 months of age, but the opportunities for exposure are usually much less than after that period. If the mother has measles at the time her baby is delivered measles may develop in the infant within the first week after birth. In such cases, the rash may be diffuse but the constitutional symptoms not necessarily severe. The situation in regard to rubella is similar. Rubella is seldom diagnosed before age 6 months. Zahorsky reported that three fourths of all cases of exanthema subitum occurred between ages 6 and 18 months, his youngest patient was 3 months old.

OVALOCYTOSIS

TO THE EDITOR—*A 16-year-old girl complained of excessive fatigue. Physical examination and the history revealed nothing except for removal of the tonsils and adenoids at 9 years of age and irregular menses for the last three years. Blood examination done in my laboratory revealed 2 700 000 red blood cells per cubic millimeter, 6.2 gm of hemoglobin per 100 cc, and 10 000 white blood cells per cubic millimeter, with polymorphonuclears 69%, lymphocytes 19%, basophils 7%, monocytes 3%, young forms 10%, and eosinophils 1%. Because there were oddly shaped red cells a smear and a sickling preparation were submitted to the clinical diagnostic laboratory at our university. The findings were ovalocytosis and frank hypochromic microcytic anemia. The patient has been reassured that her red blood cell peculiarity is of no consequence and she has been taken off the high school basketball squad until her blood becomes normal. She is receiving an iron and vitamin preparation. I find little about ovalocytosis in the books available, and I should appreciate comments.*

M.D., Mississippi

ANSWER—Ovalocytosis is a hereditary, non-sex-linked trait characterized by the presence of oval-shaped red cells in the peripheral blood, in varying numbers, occasionally reaching 90%. There is no definite relation to anemia, although an occasional tendency toward hemolysis has been reported. The lack of association with anemia and absence of racial pre-

disposition distinguish ovalocytosis from sickle cell anemia and from Mediterranean anemia with its target cells. In the normoblast, the cell body is round. The elliptic shape appears first in the reticulocyte stage of red cell development, but full development of the oval shape is reached only in the mature normocyte. In the newborn, ovalocytes are scarce. They increase gradually from the 12th day and reach adult numbers after the third or fourth month. Resistance of ovalocytes in hypotonic solutions is not different from that of normally shaped red cells (normocytes). The cause of the anomaly is not known. It has been suggested that it is an atavistic throwback. In this connection, it is worth mentioning that similarly shaped red cells are present in lower vertebrates and in camels. In the case described, it would be of interest to examine members of the family and other blood relatives for the possible presence of the same trait.

PALLIATIVE TREATMENT FOLLOWING MASTECTOMY

TO THE EDITOR—*A woman aged 64 had her left breast removed three weeks ago because of scirrhus duct carcinoma with grade 2 malignancy. She weighs only 110 lb (49.9 kg) feels well now, and is up and about. Roentgenograms of the lungs show what our roentgenologist feels are two small metastatic nodules in the left lung (faintly seen). I would like to give this patient male hormones. What is the proper dosage of methyltestosterone, and should it be swallowed or given sublingually?* M.D. Wisconsin

ANSWER—In a woman with soft tissue metastasis who is five years or more past the menopause, the hormone of choice for palliation is estrogen. The dose is 5 mg of diethylstilbestrol three times a day after meals or an equivalent dosage of one of the other forms of this drug. If there is no improvement in the patient's condition, testosterone may be tried and should be given intramuscularly in a dose of about 50 mg three times a week.

NECROBIOSIS LIPOIDICA DIABETICORUM

TO THE EDITOR—*Information is requested on the treatment of necrobiosis lipoidica diabeticorum by surgical excision and skin grafting. The patient is a 27-year-old housewife with mild diabetes controlled with insulin. The skin lesion on the dorsum of the left foot is the size of a silver dollar and interferes with locomotion.*

H Hanford Hopkins M.D., Baltimore

ANSWER—Treatment of necrobiosis lipoidica by surgical excision and skin grafting has been carried out in so few cases that relatively little information is available for guidance. In this consultant's experience, two patients so treated had a satisfactory result. Not much is known about the cause of this condition, one possibility is that local arterial disease may be present. If conservative measures are employed, lesions usually heal with the formation of a thin, cellophane-like covering. After such healing, no disability other than disfigurement results. In any case, if surgery is contemplated, any superimposed infection should be controlled and excision made with a relatively wide margin to insure postoperative healing and success of grafting.

INFLUENZAL MENINGITIS

TO THE EDITOR—*What are the recognized criteria for cure of influenzal meningitis in children?*

Edward S King, M.D., Shelby, N C

ANSWER—Most physicians feel that a sterile culture must be obtained from the cerebrospinal fluid and that the constituents of the fluid must have returned to normal before pronouncing a cure, however. Hoyne, who gives no intrathecal treatment, seldom makes more than one lumbar puncture, which is done for diagnostic purposes. He bases recovery on clinical findings. If there is an early diagnosis, patients are frequently well in from 8 to 10 days, and, among a relatively large number of patients, there have been almost no relapses.

TREATMENT OF CRYPTORCHIDISM

TO THE EDITOR—What is the latest treatment for unilateral cryptorchidism in a 4-month-old baby?

M D, Rhode Island

ANSWER—The best procedure in cases of cryptorchidism probably is as follows 1 Wait until the patient is between 2 and 3 years old 2 If the testis is still undescended at that age, give chorionic gonadotropin intramuscularly in a dose of 500 units three times a week for six to eight weeks 3 If descent fails to occur, the testis should be brought into the scrotum by surgical procedures It is important that the operation be carried out by a man with special experience in this field

NOCTURNAL ERECTIONS

TO THE EDITOR—I would like to comment on the query "Painful Nocturnal Erections" in THE JOURNAL April 4, 1953, page 1246 Too often, situations like this are quickly transferred to the psychiatrist's domain, because the history and results of the physical examination are relatively normal I would suggest that the following possibility be evaluated before psychotherapy is considered Seminal fluid is a mixture of secretions from various glands, which contains, among other things, various salts in solution After coitus, a residual amount of seminal fluid remains in the urethra Unless this is removed by urination, it solidifies, and crystals forming from the various salts present may prove sufficiently irritating to the urethral mucosa to provide a stimulus for erection, with painful sequelae Occasionally, the pain may be severe enough to arouse a man from a sound sleep There is slight hesitancy of urination because of both the erection and the accumulation of dried debris within the urethra Urination completely relieves the condition, because the irritating crystals are washed out Detumescence follows immediately Men who perform this postcoital ritual who have no organic disease are not bothered with painful nocturnal erections Apparently, the desire to leave the warmth of a bed to perform this necessary act varies with different men and also, lessens with advancing years In view of the essentially normal history and physical condition of the patient described, the suggested regimen may enable him to get his just due after 14 years in the way of an undisturbed night's rest This syndrome could appropriately be named the "lazy man's dilemma"

TREPONEMAL IMMOBILIZATION TEST

TO THE EDITOR—Since some of the answers regarding syphilis in Queries and Minor Notes in THE JOURNAL March 14, 1953, imply infallibility in the results of the treponemal immobilization test, I should like to comment on it The treponemal immobilization test can only measure the presence of treponemal immobilizing antibodies The clinical significance of the presence or absence of such antibodies must be assessed in relation to collateral evidence obtained from the patient's history, physical findings, and other serologic tests It must also be interpreted in the light of general as well as specific immunologic knowledge Present evidence indicates that treponemal immobilizing antibodies develop only in response to either treponemal infection or injection of killed treponemes Thus a repeated positive treponemal immobilization test is more specific evidence of a treponemal infection than a repeated positive standard serologic test with lipid antigens The significance of a negative result in the treponemal immobilization test is less certain In the untreated syphilitic patient who has gone beyond the secondary stage, a negative result is probably rare The treated patient presents a more complicated problem, since treponemal immobilizing antibodies are known to disappear in a large proportion of patients treated early

in the course of the disease Thus, for the patient described in the query on page 962, the unequivocal statement, "The question of whether the patient described ever had syphilis can be answered by means of a treponemal immobilization test," is not in accord with known facts If the test result is positive, the patient most probably had a treponemal infection, but, if the result is negative he may or may not have had syphilis

It also seems advisable to emphasize the restrictions in the interpretation of statements such as (page 963) "the incidence of such biological false positive tests is probably about 30 to 40% of all positive reactors routinely discovered in certain population groups" There is an increasing tendency among physicians to consider as biologically falsely positive all positive serologic test results occurring in their practice The limitations of present observations might be better expressed as follows In patients with repeated positive standard serologic test results in whom there is no history or clinical evidence of syphilis and in whom the results of spinal fluid examination are negative, a varying number will prove to have negative results in the treponemal immobilization test Among such patients studied in our laboratory, the proportion showing positive treponemal immobilization tests has varied from 35 to 97%, depending on the racial, economic, and geographical origin of the group

SELF-EXAMINATION OF THE BREASTS

TO THE EDITOR—In THE JOURNAL, Jan 3, 1953, page 86, is a query on "Self-Examination of the Breasts" For many years it has been advocated that women be taught to examine their own breasts periodically In that time I have never seen a criticism of this method My own point of view has been of slow growth after many years of attempting to train clients in periodic health examination During about 20 years of this period I have had the privilege of participating in the meetings of two active Tumor Boards, 17 years of this period being spent sitting with the Tumor Board of a grade A university medical school

The first objection to teaching a woman periodic examination of her breasts is that it makes her unduly cancer-conscious, and, contrary to some opinion, apparently that cancer-consciousness is not completely eliminated by the reassurance of her physician Secondly, if one is satisfied with any such maneuver, one has missed the opportunity of teaching the patient periodic check-up that will include the possibility of discovering the occurrence of undetected cancer not only in the breast but in the cervix and corpus uteri, ovaries, large bowel, stomach, bones, blood forming organs, and all other areas and all other tissues except, as someone has said recently, the lens of the eye It may even be that the patient is cancerous and does not "merely" have a cancer

In recent years it has seemed increasingly imperative to me that, while we continue to be tolerant of our present methods of handling so dreadful a disease as cancer, we press on to a more positive attitude, actually aspiring to and anticipating the time when we can leave mutilation behind, no matter how this is achieved The time is in sight when the oncologist should be neither exclusively a surgeon nor a radiologist nor an internist but one who is especially equipped for the integration and coordination of the knowledge of cancer, as to both diagnosis and treatment, who will directly, positively, and consciously seize on every leverage that will hasten the day when the treatment of cancer will involve minimal or no mutilation The one patient today in 80,000 who cures himself spontaneously of cancer will then become the rule rather than the exception The oncologist even now should seek to control both macrocosmic and microcosmic carcinogenic agents This field, while somewhat developed already, should be more ardently attacked

HOME CARE OF RHEUMATIC FEVER PATIENTS

Dennison Young, M D

and

Manuel Rodstein, M D, New York

In October, 1948, a two-and-a-half-year pilot project for home care of children with active rheumatic fever was instituted at Montefiore Hospital, New York City. This project was sponsored by the New York Heart Association and was an extension of the home care program begun at Montefiore Hospital in 1947.¹ The purpose of the project was to determine whether a standard of care comparable to that given in a general hospital or in a specialized institution for the care of patients with rheumatic fever could be given in the home with perhaps greater over-all benefit to the child. The program also covered the emotional and social problems of the rheumatic fever patient and his family. This report, however, is limited to the medical aspects of the program.

ORGANIZATION

The children included in the program were drawn from the geographical area of upper Manhattan and Bronx County of New York City, an area roughly 20 miles long and 6 miles wide. They were referred from various sources including the wards and clinic of Montefiore Hospital and other voluntary and municipal hospitals in the city, private physicians, and various social and voluntary agencies, including the New York Heart Association. Some patients who had been receiving care elsewhere were self-referred.

All the children were examined at home or at the referring hospital by one of us. The presence of active rheumatic fever requiring continued care at bed rest was established by clinical examination and appropriate laboratory tests. The suitability of the home situation was determined by the examining physician and the social worker. The evaluation process included a home visit in every case, and pertinent information was obtained from social workers or agencies that had had previous contact with the family.

Fairly rigid criteria were necessary in establishing the suitability of the home for the type of care planned. The following minimal standards were established: (1) the

inability of the family to afford the necessary medical care on a private basis, (2) the willingness and ability of the parents or parent (broken homes were frequently encountered) to undertake a long, exacting regimen of unpredictable duration and outcome, and (3) a suitable physical environment so that the child could have his own bed and, preferably, his own room for the purpose of isolation from respiratory infection in the home.

On the basis of these criteria, of the 88 applicants during the 30 month span of the program, 45 were accepted, while 43 were rejected or withdrew their applications when the program was explained to them in detail. Twenty-one applicants were rejected because their rheumatic fever was no longer active, or the disease was not diagnosed as rheumatic fever, 18 because of inadequate home environment or uncooperative family, and 4 for various other reasons.

The care of the child in the home was maintained by a staff of two internists, a psychiatrist, a psychologist, a psychiatric social worker, a dietitian, and an occupational therapist. The Visiting Nurse Service of New York supplied nursing care, and dental care was available at home when indicated. Children who required hospitalization during the program were admitted to a special rheumatic fever ward on the medical service at the hospital. Here we continued their supervision. On discharge from the hospital, most of the children were returned to the program. After rheumatic activity had subsided patients were discharged from the home care program to the care of the family physician. If no family physician was available the child was followed in the Montefiore children's cardiac clinic. The internists associated with the program were also on the staff of this clinic, thus, a continuity of medical care was established.

PLAN OF MEDICAL CARE

Each patient was seen by one of the internists at least once weekly and more often as indicated. Patients with congestive heart failure required more frequent visits.

From the Division of Social Medicine and the Medical Division, Montefiore Hospital. Drs. T. Duckett Jones and Ann G. Kuttner of New York and Dr. Benedict F. Massell of Boston assisted in the initiation and organization of the program. This study was supported by a grant from the New York Heart Association and initiated as a pilot project for the New York Heart Association in October, 1948.

¹ Cherkasky M. The Montefiore Hospital Home Care Program. *Am J Pub Health* 39: 163, 1949.

The mother was oriented in regard to the chronic course of the disease and was instructed to call the physician if anything unusual happened. Emergency service was always available, but the number of emergency house calls was very small.

When the child entered the program, a regimen of complete bed rest was continued or initiated. The mother was instructed by the visiting nurse in general methods of nursing care, such as giving bed baths, taking rectal temperatures, and counting the pulse. The mother maintained a chart consisting of pulse and temperature records at four-hour intervals, daily sleeping pulse rate, and weekly weight, except for patients with congestive heart failure in whom daily weights were recorded.

Shortly after a child was admitted to the program the mother was asked to keep a detailed list of the child's food intake for a week. The dietitian evaluated the diet as to qualitative and quantitative adequacy, interviewed the mother, and suggested appropriate changes in keeping with the financial status of the family. The dietitian

§ Three patients died after an average of three months on the program

made repeated visits to supervise the home diet. She was particularly helpful in outlining the low-salt diet when it was necessary and in demonstrating methods for increasing its palatability. In some cases exogenous obesity required the reduction of caloric intake. Supplementary vitamins were added to the diet of all the children. Routine monthly laboratory procedures included electrocardiogram, complete blood cell count and erythrocyte sedimentation rate, nose and throat cultures, and determination of antistreptolysin titer. Nose and throat cultures were also taken at frequent sporadic intervals. When respiratory infection was found, daily cultures were taken from the patient and also from the contacts when possible. A special laboratory for the grouping and typing of streptococci was set up in the hospital bacteriology department. Antistreptolysin titers also were determined oftener than once a month if hemolytic streptococci were found in nose and throat cultures.

The problem of the early recognition and treatment of respiratory infection presented a challenge. We were faced with two choices: either to administer penicillin to the child prophylactically or to investigate the possibility

that such infection, even in the home, could be readily recognized clinically and bacteriologically and then treated in a sane and practical fashion. The latter course seemed to offer an opportunity to gain important information. The mother was, therefore, informed of the potential seriousness of respiratory infection in the rheumatic child and was advised to call the physician immediately if the child contracted a cold or had a sudden rise in ordinarily stable temperature. Cooperation was amazingly good, and the results were excellent.

When respiratory infection developed, nose and throat cultures were taken, and then the child was given penicillin, one million units a day orally in four divided doses, as suggested by Massell, Dow, and Jones.² This therapy was continued until it was established by repeated cultures that the infection was not streptococcal. If group A beta-hemolytic streptococci were found in the culture, penicillin therapy was continued for 10 days. Repeated cultures were made to establish the disappearance of such organisms. Courses of penicillin were also given orally to persistent carriers of group A beta-hemolytic streptococci unrelated to clinical infection.

Necessary dental work was done in the home by a staff dentist, with adequate prophylactic penicillin therapy given under the supervision of the internists. When dental work was too extensive to be done at home, the child was hospitalized for a brief period and then returned to the home care program.

RESULTS

Over the 30 month period covered by the program, 45 children with chronic active rheumatic fever or in the later stages of an acute attack of the disease were treated at home. There were 32 boys and 13 girls from 4 to 19 years old, with an average age of 11.7 years. The patients remained on the program an average of 12 months, but the periods varied from 1 to 29 months.

Over the period of observation, the patients fell into three groups: (1) 20 patients with asymptomatic rheumatic fever (clinical and laboratory evidence of an active process without subjective complaints), (2) 15 patients with symptomatic rheumatic fever (acute joint manifestations, chorea, erythema marginatum, epistaxis, and supraventricular tachycardia), and (3) 10 patients with rheumatic fever and congestive heart failure.

The table summarizes the clinical end-results of the program. Six patients were transferred out of the program to a specialized institution for rheumatic fever patients and three to the care of private physicians. The disease was active in all at the time of transfer. These patients were not transferred from the program because the disease process itself was too severe or too difficult to handle at home but because the home situation had deteriorated in relation to the minimal criteria established.

Periods of hospitalization were necessary for 22 patients during the home care program. In group 1, there was one admission for each of the following reasons: severe respiratory infection, rectal bleeding, more effective bed rest, and because the family of the patient had moved out of the district covered by the home care program. In group 2, two admissions were for severe exacerbation of rheumatic fever (for adrenocortical therapy), one each for supraventricular tachycardia and severe epistaxis, and two for diagnostic reasons. Seven

admissions in group 3 were for intractable heart failure (two were hospitalized twice), one for auricular fibrillation, two for supraventricular tachycardia, and two for acute pericarditis

Aside from a few exceptions (the patients hospitalized or transferred from the program) patients in groups 1 and 2 presented no medical problems that could not be adequately handled at home. Bed rest was maintained until rheumatic activity had subsided, and then gradual ambulation was initiated. The joint manifestations responded adequately to moderate doses of salicylates. Chorea presented no unusual problems. There was no definite conclusion as to whether the home environment was beneficial or detrimental to the course of chorea, for only three such cases were observed.

Group 3, patients with active rheumatic fever and congestive heart failure, posed the most difficult problems in regard to adequate home care. A low-sodium diet was prescribed for all the patients, but it was difficult to induce the children to follow it. Lack of palatability was the chief reason, especially in regard to the reconstituted, salt-free milk powder, despite efforts to improve the taste. Digitalis was generally ineffective except in cases of auricular fibrillation. Use of mercurial diuretics frequently was necessary as determined primarily by the daily weight increase.

Despite the much greater risk of exposure to respiratory infection in these rheumatic children as compared to hospitalized rheumatic fever patients, the incidence of respiratory infection was surprisingly low. Approximately 40% of the children did not sustain any respiratory infection. In the early phases of this study, when a respiratory infection was recognized, nose and throat cultures were taken, and the patient was immediately placed on the daily dosage of one million units of penicillin administered orally. Cultures were taken daily until the absence of group A beta-hemolytic streptococci was demonstrated, then penicillin therapy was discontinued.

It soon became apparent that group A beta-hemolytic streptococcal infections occurred infrequently.³ Eventually, therefore, the administration of penicillin was limited to those patients with clinically severe respiratory infections that might conceivably have been of streptococcal origin. It was recognized, however, that the different types of nasopharyngeal infections could not be differentiated clinically. The monthly antistreptolysin titer determination was found to be a fairly reliable index to the presence of recent streptococcal infections. In two cases, throat cultures sporadically positive for group A beta-hemolytic streptococci without clinical evidence of respiratory infection were followed by a rise in titer. In one of these patients increased activation of the rheumatic fever was observed.

COMMENT

It is now apparent, after three years of observation, that cortisone-corticotropin therapy of both early, acute rheumatic fever and chronic, active rheumatic fever does not necessarily stop the active process or prevent the development of permanent cardiac involvement.⁴ The best therapy for the child with active rheumatic fever is, and probably will continue, for some time to be, a regimen of bed rest and guided mental and physical

activity. Our experience over a 30 month period appears to indicate that the majority of children can be cared for medically in the home throughout the various cycles and manifestations of rheumatic fever. With children who do not have congestive heart failure, there is little necessity for either initial hospitalization or transfer to the hospital for further definitive care.

A breakdown of the reasons for the 10 hospital admissions of nine children in groups 1 and 2 reveals that three patients were hospitalized for additional diagnostic procedures (one unrelated to rheumatic fever), four for treatment of an aspect of rheumatic fever better handled in the hospital at the time (one patient was twice hospitalized for treatment of supraventricular tachycardia), and three for miscellaneous reasons related primarily to the home situation.

Thus, in only five instances in these first two groups was hospitalization necessary because the phase of illness could be better handled in the hospital than in the home. Only twice was it considered necessary to hospitalize patients for closer observation and investigation than could be carried on in the home. Two of these 10 admissions were primarily for cortisone therapy. With our present knowledge of the use of this drug and its side-effects, these two patients could now be treated just as well at home as in the hospital.

Children with chronic active rheumatic fever and congestive heart failure are unquestionably difficult to handle at home. The severity of the disease, the greater nursing burden imposed on the mother, the constant medical attention required, and the resistance of children to the salt-free diet are the elements of the problem. Unless the period of congestive failure is short or easily controllable with the usual regimen, hospitalization becomes necessary at some phase of the illness. In fact, in our opinion, unless the usual therapeutic measures quickly relieve the failure, corticotropin therapy should definitely be instituted. There is a good possibility of clearing the congestive failure, although the rheumatic activity will not necessarily disappear. In congestive failure, hospitalization is indicated for hormonal therapy rather than its institution in the home.

The feasibility of maintaining a prolonged bed rest regimen for children cared for in the home has been questioned. In our program this was never a problem once the criteria established for home and parental suitability were fulfilled, and because of the continued stimulus to creative effort furnished by the occupational therapist and to educational achievement by the home teacher. There was one exception—a child had to be hospitalized for institution of a more satisfactorily restricted regimen.

Current belief as to the therapeutic value of a bed rest regimen during the active phase of rheumatic fever is that, by this means, the duration of the morbid process is shortened, and the degree of residual cardiac damage

3 Young D and Rodstein M. Unpublished data.

is kept to a minimum. A statistical evaluation of over-all results in regard to the time required to achieve quiescence of rheumatic activity and the degree of residual heart damage in this group of patients obviously cannot be made. We have concluded, however, that the end-results in those cared for totally at home were more favorable than results in similar patients hospitalized for the entire period of their illness.

Having accepted the restricted regimen for an indefinite period, where has the child ill with rheumatic fever preferred to spend his period of illness—in the home or in the hospital? Almost all of the children in this study had one or more prolonged periods of hospitalization either immediately prior to transfer to the program or within the year before they were first seen by us. In our experience the child and the parents have invariably preferred the period of prolonged care at home to that in the hospital. This is at complete variance with the recent report by Bauer.⁵

The argument that the possibility of hemolytic streptococcal respiratory infection is greater for the rheumatic child cared for at home than for the child in the more sheltered environment of the hospital is no longer valid. Our bacteriological and serologic studies of this group of children revealed an extremely low incidence of such streptococcal infections and of noninfected carriers in comparison with earlier studies.⁶ This low incidence and the expense and time involved make a continued bacteriological survey of all patients impractical. An equally effective and less costly method is the continued use of orally administered prophylactic penicillin in all patients cared for at home. The efficacy of this therapy has been well demonstrated.⁷

This was a pilot study purposely well provided with personnel and laboratory facilities, so that data on all

aspects of caring for the sick child at home could be obtained. A home care rheumatic fever program could be effective with a much simpler structure and with a minimum of laboratory services and professional personnel. The routine oral use of penicillin prophylactically would eliminate the necessity for elaborate and time-consuming bacteriological and serologic studies. Several functions could be performed by the same person. Minimal requirements recommended for such a program are personnel including an internist or pediatrician, visiting nurse, and a psychiatric social worker and laboratory facilities for basic hematological and bacteriological studies and electrocardiography.

SUMMARY AND CONCLUSIONS

The organization, medical management, and results of a 30 month pilot project for the complete care in the home of the child ill with chronic active rheumatic fever are described. Clinical conditions and social problems requiring termination of care at home and hospitalization are described. Results indicate that when certain initial criteria for home suitability are met, most children with active rheumatic fever and free of congestive heart failure can be cared for as well at home as in the hospital, with an equally good end-result and with greater over-all advantage to the patient and his family.

PHILADELPHIA PLAN FOR HOME CARE OF CHRONICALLY ILL PERSONS

Louis Udell, M.D., Philadelphia

A home care program differing in concept and method from others more generally known has been in operation in a section of Philadelphia since 1949, under the aegis of the Visiting Nurse Society of Philadelphia. This program, officially known as the Intensive Home Care Plan for the Chronically Ill, is based on medical care rendered by the family physician practicing in the community, in contrast to plans in which medical care is given by staff physicians of the hospital from which the patient has been discharged. The purpose of the plan is to give the chronically ill, home-bound patient better and more complete medical care in his own home, using the team co-operation approach and always keeping him under the direct supervision of his private physician. It was designed to permit the participating hospitals to use their beds to better advantage by the discharge of patients who no longer need specialized hospital care and who can, therefore, be sent home, provided the necessary equipment, personnel, and supervision are available. We be-

lieved that our plan would reduce the incidence of re-hospitalization among patients referred to us by the participating hospitals. The plan was set up also to improve medical and social care of persons who have been home-bound for long periods, who may or may not have been previously hospitalized, and who probably sometimes feel deserted. We believe that our plan would reduce the number of initial hospitalizations among this group.

Many home care plans have been established under the direct supervision of the institution sponsoring them and have been considered to be extramural functions of those institutions. The patient remains under direct care of the hospital, and the private physician has no voice in the further management of the case. That all these plans have been successful has been fairly well established. The cost of the care of the patient at home by the hospital is generally stated to be about one-fourth the cost of caring for that patient in the hospital. The important considerations are that the patient continue to receive good care at home and that, thus, the number of hospital readmissions

is reduced. Many patients who do poorly in the hospital do much better in their home surroundings, eating the food that suits their palate, seeing their friends at any time, and being with their loved ones.

In our plan, in contrast to other plans, the patient must always remain under the direct supervision of his personal physician, whose orders we follow. Nothing is done without orders from the patient's physician. Patients may be referred by private physicians or hospitals. The hospitals must make certain that the referred patient has a physician responsible for him at home, either his own or one appointed by the institution. Patients requiring an appointed physician are usually those who have no private physician because they are unable to afford one. Since an adequate physician-patient relationship is a necessity for the success of our plan, it was decided early that, to maintain this important relationship, we would, when circumstances demanded, pay the physician's fees, using the Pennsylvania Department of Public Assistance fee schedules as a basis. Thus, our indigent patients would not have to worry about the "doctor bills," and physicians would not have to curtail medical supervision because of economic considerations.

Ideal home conditions do not enter the decision to accept a patient into our plan. Although we certainly prefer such conditions, many patients have been accepted whose home conditions were rather poor. The hospitals in the area have no direct voice in the administration of the plan. In addition to their arrangement for physicians to be responsible for their referred patients, they are asked to provide social appraisals of these patients. We proceed from that point. The hospitals are asked to provide necessary laboratory and x-ray services for all patients when these services are otherwise unobtainable, for which they are paid by the patient or by our plan. They also are asked to supply medical and surgical consultants on a clinic basis and to hospitalize and rehospitalize patients when necessary. It is most gratifying that all of the hospitals in the area are cooperating very well.

The plan provides the following services in the patient's home, always under the direction of the patient's own physician and under the supervision of a nurse coordinator, who is a member of the Visiting Nurse Society staff:

- Part time nursing service
- Physiotherapy
- Occupational therapy
- Part time housekeeping service
- Nutrition consultation
- Mental hygiene consultation
- Social service consultation through existing agencies
- Laboratory service
- X ray service at hospital x ray departments
- Medical and surgical consultation service at hospital clinics
- Transportation to and from hospitals and clinics
- Speech therapy
- Education consultation
- Surgical appliances such as braces shoes and corsets
- Home medical equipment such as beds walkers and bedpans
- Medical supplies such as bandages and medicine
- Friendly visitors

Our permanent staff consists of a part-time medical director, a full-time coordinator, and a part-time secretary. Whenever possible we have used existing staffs for

direct services, thus nursing services, physical therapy, and occupational therapy have been supplied by the two cooperating agencies, namely, the Visiting Nurse Society and the Starr Centre Association, while social case work is provided by the social service departments of the cooperating hospitals and the community social service agencies.

OPERATION OF THE PLAN

The physician in charge of the patient is asked to fill out a referral form giving the pertinent medical information about the patient and prescribing the treatment, such as nursing, administration of medicine, physiotherapy, occupational therapy if desired, and diet. This referral form is kept as simple as possible. After studying this information, the medical director of the plan visits the home to evaluate the situation and to become acquainted with the patient and his family. Meanwhile, the patient and the home have been visited by a nurse or the coordinator, who ascertains home conditions, explains the plan to the family and patient, determines what costs, if any, the family can bear, and decides what home equipment is needed and whether part-time housekeeping is required. Social service consultation follows if needed. A decision is then made by the coordinator and the medical director as to the acceptability of the patient, and the referring physician is called to inform him of the decision and to discuss any problems. We have not knowingly accepted psychiatric patients or patients with communicable diseases.

The physician is asked to give a monthly report on the patient's progress, indicating any change in treatment or diagnosis, making use of a simple form that is mailed to him with a self-addressed stamped return envelope. The physician in turn receives a monthly report of what has been done for the patient. The cooperation of the physicians has been good. The nurse in charge of the patient contacts the physician whenever an immediate problem arises. Periodically, problem patients are discussed at evaluation conferences, at which time all persons working with the patient are asked to be present. We have tried to have the physician in charge of the patient present at the conferences but so far have succeeded in getting only a few to come. We believe these conferences have a great potential value to all personnel involved at the postgraduate level of education. The physicians are especially benefited by learning the scope of ancillary medical services available to their patients. These conferences show to all the method and results of the team approach to the care of chronically ill persons.

RESULTS OF PROGRAM AND SERVICES RENDERED

After approval by the Philadelphia County Medical Society in March, 1949, the first patient was accepted in April. On July 31, 1952, after three and a fourth years of operation, 160 patients had been accepted, 84 were discharged, 36 died, and 40 are still being cared for. An analysis of the 84 patients who have been discharged reveals the following facts: 8 patients returned to school or work, 41 were able to resume most of their activities of daily living, 11 were discharged because their families were able to take over complete care guided by pro-

set up by our plan, 5 were returned to the regular Visiting Nurse Service, since they required only one service and, therefore, did not need a coordinated program, 6 were discharged because they or their families were indifferent, 1 was discharged because his physician was indifferent toward our efforts. The last patient was discharged to the regular Visiting Nurse Service so that he would not be left without care.

An analysis of the sources of patient referrals showed that 42 patients were referred by local cooperating hospitals, and 118 were referred directly by private physicians. These latter 118 patients were referred by 90 physicians as follows: 69 physicians referred one patient each, 18 referred two patients each, 1 referred three patients, 1 referred four patients, and 1 referred six patients.

Many of the private physician referrals were stimulated by the alertness of the Visiting Nurse Society and Starr Centre Association nurses, who, on answering routine nursing calls, found chronically ill patients, many of them aged, who required coordinated home care. These nurses would then acquaint either our coordinator or our medical director with the problem, then one of our staff would explain our services to the physician and the family. Most of the physicians and families were convinced about the worth of the service and made application for care. It is gratifying to note that a certain number of physicians who were originally approached in this manner are now directly applying for aid for their chronically ill, home-bound patients.

The age distribution of the patients accepted as of July 31, 1952, is shown in the following tabulation:

Under 30	9 (6.1%)
30-39	11 (6.9%)
40-49	16 (10%)
50-59	31 (19%)
60-69	36 (22.6%)
70-79	40 (25%)
Over 80	17 (10.6%)

Thus 93 (58.1%) of our patients were 60 years of age or older. The primary diagnoses among these 160 patients were as follows: cerebral vascular accidents 48, malignant disease 24, circulatory system diseases 19, arthritis 20, fractures 20, nervous system diseases 14, diabetes 9, bone diseases 2, nonmalignant tumors 2, and muscular dystrophies 2.

The services rendered and the number of patients receiving the services were as follows: nursing service 133, physiotherapy 116, occupational therapy 101, part-time housekeeping 41, nutrition consultation 22, mental hygiene consultation 40, social service consultation 75, x-ray service 4, laboratory service 4, medical consultation at hospital clinics 7, transportation to and from hospitals and clinics 8, speech therapy 7, education consultation 5, surgical appliances, such as braces, shoes, and corsets, 1; medical supplies, such as bandages and medicine, 4; 1; such as beds, walkers, and bedpans, 1; and physician's bills paid by the plan, \$100, 4. The number of the various services rendered to the various

tor's visits 332, personal physicians' visits 1,503, clinic visits 47, medical-director's visits 214, nursing visits 4,546, physical therapy visits 2,664, occupational therapy visits 1,209, speech therapy visits 170, nutrition conferences 17, mental hygiene conferences 32, miscellaneous conferences, including social service conferences, 196. No accurate data on the amount of housekeeping done is available, since many patients made their own arrangements with housekeepers whom we suggested. Fifteen patients were readmitted to the hospital while receiving care under the plan.

As stated, our current case load is 40 patients, our maximum has been 43. The total number of patient days spent has been 29,443. The experience in this plan seems to follow the general experience in the Visiting Nurse Society in that about 50% of the nursing, physical therapy, and occupational therapy service is fully paid for by the patient. The plan has cost the community about \$2.60 per patient day. This cost per patient day was computed without deducting fees paid by patients who were financially able to pay them for nursing care, physical therapy, occupational therapy, and other services.

COMMENT

The cooperating hospitals have responded favorably to this plan, even though more referrals from them would be desirable. These hospitals are the Germantown Hospital, Chestnut Hill Hospital, the Hospital of the Woman's Medical College of Pennsylvania, Albert Einstein Medical Center (North), and the Memorial Hospital of Roxborough. Germantown Hospital has estimated that the plan saved the hospital about 500 hospital patient days from April 1, 1949, to Jan. 24, 1951. The number of referrals from the hospitals varies directly with their awareness of the plan and the interest of their social service departments.

Sometimes the hospitals have delayed in referring patients because of delay in finding a physician who would assume responsibility for the patient. This has not proved to be too great a problem. One hospital has solved it by supporting by a fellowship a part-time physician who is responsible for indigent home-bound cancer patients who have no private physician. Since this physician is acting as the patient's private physician, our requirement that each patient have his own physician is fulfilled. The hospitals have expressed disappointment in being unable to refer patients whose residence is outside the boundaries set up for the plan. In the not too distant future, this problem will be partly solved by extension of our geographical boundaries.

Most of the physicians have been enthusiastic about our plan. Several were dubious at first, and a few turned down the plan, claiming that nothing could be done for their patients or that they did not wish to put their patients to the added expense. Some of these physicians were persuaded to try the plan after being informed that they would have absolute control of the patient and that the matter of expense would not enter into our decision to admit the patient to our plan. These same physicians

soon discovered that we made it possible for them to care for their patients more adequately and with much less effort on their part

How has this plan affected the interest of the physician in his patient? Does it increase or decrease? Unquestionably, I believe it increases in most instances. The physician becomes more cognizant of the beneficial effects on his patient of the cooperation of a team of workers in the patient's care. This team of workers must include the physician as the keystone of the group. He soon realizes this and before long, either consciously or otherwise, is himself taking greater interest in his patient. Thus, I believe the plan has been a driving force in educating the private physician to the potentialities of teamwork in home care.

The nurses and other workers in the plan have benefited, too. Their interest and efficiency in caring for these patients have increased tremendously. This, I believe, and our staff agrees, is due to the team approach of caring for chronically ill patients. We believe that the total amount of nursing services for many patients has been cut down as compared to the amount required by similar patients under the care of the Visiting Nurse Society before the Intensive Home Care Plan was started. Many hemiplegic patients who received custodial care at home instead of coordinated care had to be visited by nurses for longer periods than those receiving care under the Intensive Home Care Plan. The latter patients were able to be cared for by their families or by themselves sooner than the former patients.

What has been the reaction of the patients and their families? Almost all hospitalized patients want to return home as soon as possible, and they are most grateful when they can get home sooner than would otherwise be possible. Many patients who are sullen and rebellious in the hospital become happy and cooperative at home. Many patients who have been home for a long time, bed-fast or partially helpless, feel they are being forgotten and have nothing to look forward to. These patients, I believe, have received a tremendous benefit and uplift as a result of our plan. This benefit cannot be measured in units, but all our staff agree that it is real and worth while. The fact that persons come in to give them care and that these persons show interest in them and teach them something raises them from despondency. The well members of the families also find a new lease on life. Whereas before they did not know where to get help, they now receive support from our plan in housekeeping, advice and knowledge of how to handle and care for the patient. Above all, when they see the sick one a little more contented and pleased, they also feel pleased. At first, some families were anxious to place their patients in nursing homes or similar institutions. After interviewing these families, it was realized that they actually were afraid to keep the patients home, because they did not know how to take care of them. With education and advice and having some extra equipment in the home, some families were soon happy to keep their sick member at home.

SUMMARY AND CONCLUSIONS

The experiment described was developed in response to organized community demand to determine whether medical and supportive services for chronically ill patients in their own homes and under the care of their own visiting physicians, when developed in a coordinated manner, would lead to maximum improvement physically, emotionally, or socially, at less expense than that of hospital or institutional care. Under this program, in operation for three and one-quarter years in one section of a large eastern city, 160 patients have been cared for. Services have been offered on a visiting basis at a frequency determined by the individual need and have been coordinated by a community public health nursing association. The team approach has been used throughout, with careful admission review and regular progress conferences. Referrals have come from all hospitals and a large number of private physicians in the area. Review of the progress made by patients with a wide variety of conditions and observation of the favorable changes in family life suggest this program as one approach to the problem of care for persons with chronic illness who wish to remain at home. In our experience, those who display readiness to cooperate in intensive care show improvement physically, emotionally, or socially in situations formerly believed static or hopeless. Consideration of the organization pattern, the interagency, physician-agency, and physician-patient relationships, and the expenses involved in promotion and operation lead to the conclusion that such a plan can be repeated in a wide variety of communities.

4540 Cottman Ave (35)

Trial Forceps—Midpelvic arrest may be due to a variety of causes bony disproportion being only one, and many of these are correctable, after which vaginal delivery is easy and safe. Therefore it would be poor obstetrics indeed to say that every patient with midpelvic arrest must be delivered abdominally or that all must be delivered from below. From the literature and from personal conversation and communication it is quite apparent that many outstanding obstetricians are practicing trial forceps today. This study has convinced us that the midforceps operation, when always carried to conclusion, may be a very dangerous one for the infant, ranking second only to internal podalic version and breech extraction. On the other hand, many of these cases of midpelvic arrest may be capable of successful delivery with gentle traction and with a minimum of risk. If these gentle efforts fail, all attempts at vaginal delivery should be discontinued and resort had to the abdominal route. This does not appear to increase the risk to the mother while it is definitely less hazardous for the baby. It is true that the section rate may be slightly increased in theory, but it is doubtful if this will prove true in actual practice, for a certain number of patients delivered abdominally without trial forceps would be found to have easy vaginal deliveries when the attempt is made.

It should be emphasized that "trial forceps" is a method of delivery which should be undertaken only by a skilled obstetrician, and not by the general practitioner who has had no specialty training. This is also true of many obstetrical operations, not the least of which is a midforceps delivery itself. It is felt that this fact should not prevent its recommendation or its use.—L. H. Douglass, M.D., and D. F. Kaltreider, M.D., *Trial Forceps*, *American Journal of Obstetrics and Gynecology*, April, 1953.

REDUCTION IN OPERATIVE MORTALITY IN THE VERY AGED

Sidney E. Ziffren, M D, Iowa City

Most physicians are aware of the tremendous rise in the number of aged persons in our population, but few are aware of the magnitude of that increase. Since the first part of the 20th century the number of persons 65 years of age and older in the United States has quadrupled, while the general population has only doubled. There are 12,269,537 men and women 65 years of age and over in our population today. Of this number it has been estimated that 1,670,000 or approximately 13.6% of this age group are 80 years of age and over. The improvement in life expectancy has been greatest at birth and decreases markedly thereafter, so that today the actual life span at the age of 80 is not much longer than it was in 1900. More persons survive to an older age than before, but, having reached this age, they do not survive longer than did the aged in 1900. For instance, in 1900 the life expectancy at the age of 80 was 5.1 years. At present it is 5.4 years. On the basis of a projection from census figures it is estimated that in 1960 there will be about 15,570,000 persons in the age group of 65 years and over, and approximately 13.8% of this group, an estimated 2,175,000 persons,¹ will be 80 years of age and over. Even with this outlook, however, the complete expectation of life of the white male, as extracted from the United States life and actuarial tables of 1939 to 1941,² is a remarkable number of years if he reaches extreme old age (fig. 1). This is the average number of years lived after a specified age if the person survives to that age. A person who survives to the age of 80 will have a life expectancy of 5.44 years, which falls to 4.11 years at the age of 85, to 3.17 years at the age of 90, and to 2.52 years at the age of 95.

In consideration of these facts, therefore, necessary surgery should not be withheld from elderly persons because of old age. It is the purpose of this paper to show that age per se is not a contraindication to necessary surgery. A review of the patients 80 years old and over who were treated surgically at the University Hospitals of the State University of Iowa during the 10 year period, 1942 to 1951 inclusive, forms a major portion of this report. These patients were cared for on the general surgery service exclusively, auxiliary services such as urology and orthopedics are not included.

STATISTICAL RESULTS OF SURGERY

In this series there were 429 patients, 16 of whom were 90 years of age or over. The age distribution was as follows: 80 to 84 years, 306 patients; 85 to 90 years, 107

patients, 90 years and over, 16 patients. There were 265 men and 164 women. A total of 478 operations were performed on this group, with an over-all mortality of 65 deaths (15.1%). If the mortality is calculated on the total number of operative procedures performed rather than upon the number of patients, the mortality is 13.5%. Forty-one patients had multiple operations, and in this group there were only four deaths, a mortality rate of 9.7%. The commonest causes of death were bronchopneumonia, pulmonary embolus, cardiac failure, metastatic carcinoma, and peritonitis. In practically all instances general anesthesia was given, sometimes supplemented with local anesthesia. In only a few instances was spinal anesthesia used. A wide variety of surgical procedures were performed on the group. The marked increase in the number of patients 80 years old or over during this 10 year period is evident in figure 2. In 1942 only 15 patients were admitted for operative procedures at the age of 80 or over, and in 1951 79 patients were admitted. It is interesting to note that the surgical procedures performed in 1951 were of far greater magnitude than those performed in 1942 and included neck dissection, bowel resections, gastric resections, and radical mastectomies. The decrease in the mortality rate is also apparent. In 1942 it was 13.3%, in 1943, 18.6%, in 1944, 30.0%, in 1945, 35.8%, in 1946, 16.6%, in 1947, 13.8%, in 1948, 15.3%, in 1949, 6.5%, in 1950, 7.4%, and in 1951, 11.3%. In 1951 two patients with generalized peritonitis from perforation of the colon proximal to a malignant lesion with obstruction were operated on as a last resort. The chances of recovery were very slight because of the nature and duration of the peritonitis. If these two patients had not been operated on, the mortality rate in 1951 would have been 8.8%. The surgery was performed by both surgical residents and staff physicians. It is evident from this series that operative techniques had very little influence on the reduction in operative mortality. The most important factors were preoperative and postoperative care and the availability of antibiotic drugs.

PREOPERATIVE AND POSTOPERATIVE CARE

If there is no emergency, time must be taken to ensure that the blood volume and protein reserves of the patient are adequate and that he is properly hydrated. It is easy to be misled by a presumably normal hemoglobin level and red blood cell count in the elderly patient, this may lead to a false sense of security. It has been demonstrated that practically all elderly surgical patients have a significant deficiency in blood volume.³ The possibility of shock during surgery is very much greater in the aged person with a low blood volume. If any major surgical procedure is contemplated, transfusions must be considered a necessary part of the preoperative preparation of the patient.

The elderly patient is very likely to have nutritional deficiencies, especially if he has a condition requiring surgery. Consequently, a nutritious diet, rich in protein,

must be provided and often must be individualized to encourage the patient to eat. It is supplemented with vitamins given orally and sometimes, parenterally. The patient is often provided with whiskey to increase his appetite, if he still does not have an adequate food intake, a supplementary formula feeding of high protein and caloric value is given. The simple formula used is 30 gm of skim milk powder (approximately 3 full tablespoons) dissolved in a glass of skim milk. This provides 18 gm of protein and 26 gm of carbohydrate. The mixture is

Fig 1.—Life expectancy of persons 80 to 95 years old among the general population

flavored with chocolate or vanilla and is well mixed in a food blender or beater. If the patient does not take the formula feedings voluntarily, an indwelling polyethylene gastric tube is used. The improvement in the mental attitude of many patients after several days of adequate nutrition is often remarkable.

In some instances it is impossible to feed the patient by mouth, which, of course, is the most suitable method of providing the nutritional requirements. Parenteral feedings by the intravenous route can be used, but the fluid must be administered slowly to avoid overloading of the circulation. The water requirement can be easily met, and a major portion of the caloric needs can be supplied by use of the protein hydrolysates. Alcohol is usually added to these solutions to provide additional calories. The loss of the patient's protein reserve can be reduced to a minimum in this fashion. Subcutaneous feedings also may be utilized. The use of hypodermoclysis may be dangerous, however, especially in a patient who is suffering from dehydration, salt deficiency, or shock.⁴ Ordinarily, the subfascial injection of isotonic saline is safe, but injection of a solution without electrolytes, such as 5% glucose in water, or of hypertonic solutions without inorganic electrolytes may cause oliguria, anuria, or circulatory collapse. The latter two types of fluid must first come into equilibrium with the plasma to be absorbed, and thus, withdraw fluid from the plasma and interstitial fluid compartments. In the aged this is especially dangerous, because the physiological reserve is low. The use of hyaluronidase, which causes the solution to diffuse over a greater area, and thus possibly increases the amount injected, might very well intensify this dangerous reaction. The intravenous route seems to be the safest means of parenteral fluid introduction.

The one factor that has considerably reduced the mortality in these elderly patients has been the marked restriction of salt and fluids administered parenterally. This restriction was inaugurated in 1949 after results of surgery in this age group were reviewed.⁵ A marked fall in the mortality rate resulted. The maximal amount of salt

permitted daily is 5 gm unless replacement of a definite sodium chloride loss is necessary. It has been found that if salt and fluid are not restricted, edema may develop rapidly and unexpectedly, this may result in a markedly increased susceptibility of the patient to pulmonary and cardiac complications. In addition, it has been noted that patients in this age group rarely require more than 1,800 ml of fluid a day. The intravenous administration of more than 2,000 ml daily may prove extremely hazardous unless the patient is definitely dehydrated. It is likely that the very elderly person has a much lower metabolism and eliminates much less waste in his urine than does a younger person and, consequently, requires much less fluid daily.

The patient is not permitted to remain recumbent constantly. He is urged to go to the bathroom and to walk about the ward freely. The cardiac and kidney status must be evaluated, and, if necessary, digitalization is accomplished. If azotemia is present, it should be treated prior to surgery.

Even in an acute emergency, time must be taken to overcome dehydration and shock preoperatively, because the aged patient is much more susceptible to blood volume loss from dehydration and shock than is a younger person. His vasomotor system is far less capable of compensating, and the heart is unable to increase its rate and output. If this is not done it can be expected that the patient will die on the operating table or shortly thereafter. If the patient is severely dehydrated a relatively rapid rate of fluid administration by intravenous means is not harmful, because this fluid will be utilized rapidly. As a general rule the first 1,500 ml of fluid can be introduced at the same rate that would be used for a younger person. After that quantity has been administered the patient usually begins to excrete urine, and the rate of intravenous flow can then be adjusted not to exceed 500 ml an hour.

Fig 2.—Increase in number of surgical patients 80 years old and over in the series reported from 1942 to 1951 inclusive

There is no single ideal anesthetic agent, either general or local, for the aged patient. The same fundamentals that govern the choice of anesthetic agent in the young apply to the aged. The agent chosen should provide the

5 Ziffren S E, Zager I L, and Cullen S C. Hazards of Surgery Beyond the Age of Eighty. *Geriatrics* 5: 252-258 (Sept-Oct) 1950.

desired depth of anesthesia with minimal derangement of the physiological processes of the patient. Wide swings in the depth of anesthesia and prolonged deep anesthesia should not be permitted. At all costs abnormally low blood pressure must be avoided, less concern is felt about abnormally high pressures. The oxygenation of the heart and cerebrum is of paramount importance.

During the postoperative period every effort must be made to have these patients out of bed and in a chair on the day of operation and several times daily thereafter. They must be turned frequently and given a minimum of sedation. Morphine or meperidine (Demerol) hydrochloride in small quantities may be used for severe pain, but it is not too unusual to see wide hallucinatory side-effects such as are commonly seen with the barbiturates, even when the drugs are given in very small quantities. Intercostal nerve block instead of analgesic drugs for relief of upper abdominal or thoracic pain often proves very satisfactory.

If a Levin tube is used in the stomach for gastric suction it should be removed as soon as possible. The tube inhibits coughing, increases the amount of mucous secretion, which may lead to atelectasis and subsequent pneumonia, and not infrequently produces ulceration of the pharynx and esophagus, which interferes with the early resumption of oral feeding. An even greater problem produced by the tube is an upset of electrolyte balance, which may be difficult to control, over a prolonged period the loss of potassium may in turn lead to a vicious circle of prolongation of the intestinal ileus for which the gastric suction was primarily used. It is not unusual, however, to find that resumption of normal peristalsis in the aged after an abdominal operation is very slow or, if it does resume early, that the peristalsis is only segmental, and the abdomen becomes distended on withdrawal of the Levin tube. This condition is often incorrectly diagnosed as a mechanical intestinal obstruction. Actually, the patient has not regained bowel tone throughout the intestinal tract, but only in segments of bowel. Within a short time peristalsis returns to normal.

Oral feeding is encouraged as soon as possible, and again, every effort is made to keep the parenteral salt intake at a minimum to prevent edema and its inevitable fatal complications. If the patient has required constant gastric suction for a prolonged period, the possibility of potassium deficiency must be considered. Parenteral administration of potassium can be used in the extremely aged only if the patient is excreting an adequate quantity of urine. Heart block due to myocardial disease is always a possibility in the aged and should be considered prior to the parenteral administration of potassium. In such cases the fluid containing the potassium must be administered very slowly. If the patient can take fluids by mouth, potassium deficit is no problem, inasmuch as it is easily corrected by an ordinary diet rich in bouillon broth and fresh fruit juice.

Hypotension, with its dangers of thrombosis and irreversible shock, is avoided at all costs. This necessarily requires frequent checks on blood pressure and pulse rate during the immediate postoperative period. Penicillin is given routinely to prevent infective pulmonary complications. It is well to remember, however, that pulmonary complications ordinarily are preceded by

edema, which can usually be prevented by restricting the salt intake and by not overloading the circulation with large quantities of intravenous fluids.

COMMENT

From the results obtained in this series it appears that necessary operative procedures should not be withheld from patients in the advanced age group. If reasonable attention is given to details, good results can be expected. In consideration of the fact that a person 80 years old has almost 6 years of life expectancy and at 90 has over 3 years, every effort must be made to treat patients in this extreme age group, they should not be permitted to die simply because they are believed to be too old to withstand surgery. The fall in mortality rate in the series, from a high of 35.8% to the astonishingly low figure of approximately 11% within a short span of 6 years, demonstrates what can be accomplished in the management of these elderly persons.

This, however, should not permit us to grow careless in the handling of the aged surgical patient. Elective surgery should be undertaken only with the greatest hesitation. Postponement of surgery until the patient is in optimal condition, especially from the standpoint of blood volume and nutrition, is important, and avoidance of circulatory embarrassment through overloading with salt and water must be kept constantly in mind. The staging of operations must also be considered, for, as demonstrated in the mortality statistics, repeated small procedures are better tolerated by very feeble persons than is one large procedure. The use of antibiotics has undoubtedly contributed to a lowering of the operative mortality, but not overwhelmingly, for the drugs were used during practically the entire period of this study.

SUMMARY

Surgical procedures carried out on patients 80 years of age and over during a 10 year period, 1942 to 1951, inclusive, have been reviewed. The over-all mortality was 15.1%. During the years studied, in spite of a more than fivefold increase in the number of surgical procedures performed, the mortality rate has dropped to 11.3%. Age alone is not a contraindication to necessary surgery. The factors contributing chiefly to the lowering of the mortality rate are the preoperative preparation and postoperative care of the patient in regard to nutrition, blood volume, salt and water intake, and the use of the antibiotics.

Adenocarcinoma of the Uterine Corpus—In our series, carcinoma of the corpus constituted 32.2% of uterine malignancy and 23.4% of total female reproductive tract malignancy. Carcinoma of the corpus is primarily a disease of the early postmenopausal period, although 20 to 30% of the cases occur before the menopause. Seventy-five per cent of the cases occur after the age of 50. The highest incidence of carcinoma of the corpus occurs in the sixth decade. The average age varies from 50 to 58 years. Age is a distinct factor in the ratio of carcinoma of the corpus to carcinoma of the cervix, and the relatively increased incidence of corpus carcinoma cited above may be associated with the aging of our population. Under 35 years of age, corpus carcinoma constitutes 3% of uterine malignancy. This ratio gradually increases with age. In the sixth decade approximately 37% of uterine cancer is due to corpus carcinoma and in the seventh decade this ratio increases to 44%. —C. P. McCartney, M.D., *Adenocarcinoma of the Uterine Corpus*, *Surgical Clinics of North America*, February, 1953.

BRONCHOSTENOSIS COMPLICATING ASTHMA

Thomas W Mears, M D , Louis E Prickman, M D
and

Herman J Moersch, M D , Rochester, Minn

Benign nontuberculous bronchostenosis is a complication of either intrinsic or extrinsic asthma that too often is unrecognized. By bronchostenosis is meant a definite stricture-like narrowing of a bronchus that is considered to be inflammatory in nature and not the result of allergic edema or spasm. In 1939, two of us (L E P and H J M)¹ described the symptoms, physical findings, and the laboratory information that characterize bronchostenosis in asthma, and, in 1940,² we reviewed our experience at the Mayo Clinic with 140 patients with asthma who had been especially selected for bronchoscopic examination. Of this series, 60 patients were found to have definite stenosis of one or more bronchi. Subsequently, others³ have reported their experiences with this complication of asthma.

Recently we reviewed the records of 1,034 consecutive asthmatic patients who underwent bronchoscopic examination during the decade ending in 1950. Of these, 327 were found to have stenosis of one or more bronchi. There were 182 female and 145 male patients in this series. All age groups were represented, the youngest patient being 3 years of age and the oldest 74 (fig 1). The largest number of cases in any decade of life were found in the age group 40 to 49 years inclusive, however, in the decades preceding and following this one many cases were seen.

SYMPTOMS

The syndrome of bronchostenosis complicating asthma is a rather definite one and will be reviewed in some detail. The most prominent symptom is cough, which is usually persistent and at times paroxysmal. This, of course, aggravates the patient's asthma. The cough is usually productive of sputum, which varies in amount and character. During the period when a bronchus is stenosed, there is retention of secretions distal to the point of obstruction of the bronchus, and sputum may be absent or scanty. A localized obstructive pneumonitis develops and persists until this site is drained, either spontaneously or by bronchoscopic dilatation and aspiration of the retained secretions. Such secretions are mucopurulent, and after bronchoscopy they may drain in considerable quantity. Thus, it is not unusual for the cough to be nonproductive during an episode of bronchostenosis. The paroxysms of coughing are the patient's involuntary effort to overcome the stenosis and raise the retained secretions.

The second commonest symptom noted in our patients was fever, and the fever was occasionally accompanied by chills. Fifty-nine per cent of the patients gave a history of fever with their attacks. The fever was usually moderate and lasted from a few to many days. Often, as the febrile episode subsided, the cough became productive of increasing amounts of yellow or greenish sputum. The fever may be explained as resulting from the retention of secretions and from the inflammatory reaction in the adjacent lung. Fever was usually accompanied by leukocytosis.

Hemoptysis was noted in 35% of the patients reviewed and is an important symptom. Hemoptysis does not oc-

cur in uncomplicated asthma, and the source or cause must always be searched for. Bronchoscopy should always be carried out if no obvious cause for hemoptysis is found. The source of the blood-tinged sputum in bronchostenosis is thought to be the site of inflammation of the bronchus distal to the site of stenosis. A good rule to remember is that uncomplicated asthma is not associated with fever, purulent sputum, or hemoptysis.

Also worthy of note is the fact that 50% of the patients in this series gave a history of an infection of the upper respiratory tract preceding the attack. This was usually described by the patient as a "cold." A history of one or more episodes of pneumonia was obtained in 43% of the patients. A positive history of pleurisy on the affected side was obtained in 32%. Bronchostenosis is often mistaken for pneumonia because of the severity of the cough, the fever, blood-tinged sputum, physical findings, and roentgenologic evidence of localized pneumonitis or atelectasis. Many patients had a history of repeated febrile attacks that were described as "flu." It should be axiomatic, therefore, that a patient who has asthma and experiences one attack or repeated attacks of pneumonia, pleurisy, or influenza certainly must be suspected of having had bronchostenosis until the nature of the illness is proved otherwise. This is true of children as well as of adults.

PHYSICAL FINDINGS

The physical examination of persons having asthma complicated by bronchostenosis may disclose no abnormal findings other than the usual asthmatic rales, however, additional abnormal findings were present in 39% of the patients in our series. When a large bronchus is obstructed, either emphysema (ball-valve action) or, more often, obstructive pneumonitis occurs in that portion of the lung distal to the point of obstruction.⁴ It should be emphasized that any obstructive bronchial lesion, for example, a foreign body or malignant growth, may produce asthma-like wheezing and dyspnea. This is an important consideration in the differential diagnosis of asthma, recalling the aphorism of Jackson that "all is not asthma that wheezes."

It is evident, therefore, that the physical findings in cases of bronchostenosis will vary. If abnormal findings are encountered, they will usually be those of obstructive

pneumonitis. The breath sounds in such cases are suppressed, and tactile fremitus is also suppressed over the affected site. Less frequently, there may be dullness to percussion over the affected part and a respiratory lag, with diminished excursion of the thorax, on the affected side. Careful and repeated examination of the asthmatic

Fig. 1—Distribution of patients with bronchostenosis complicating asthma according to age

thorax should be made, because there will often be definite if not pronounced differences in the physical findings between the involved region in one lung and the corresponding uninvolved region in the opposite lung. Reexamination of the thorax after the patient coughs as well as reexamination on a subsequent day is important, because the occlusive signs may be due to a plug of mucus or a bronchial cast that is temporarily blocking a bronchus, in which case, on subsequent examination, these signs may have entirely disappeared. The presence of persistent and unilateral abnormal physical findings are of utmost importance, because in uncomplicated asthma the physical findings are similar in the two lungs. These positive findings will usually be present over the posterior part of the lower lobes, however, in five patients in our series, the obstruction proved to be in a bronchus of an upper lobe.

ROENTGENOLOGIC EVIDENCE

Because of the low incidence of positive roentgenologic evidence in the cases reviewed, we place more emphasis on the history and physical findings. In only 30% of the cases were the thoracic roentgenograms of some value in making the diagnosis of bronchostenosis. Several factors contribute to the high incidence of negative roentgenologic findings. Bronchostenosis may not have been present long enough in many instances to have produced changes visible in stereoscopic roentgenograms. In other

cases, the lesion may be situated behind the cardiac shadow in the routine posteroanterior view of the thorax, and in other instances the presence of long-standing bronchitis results in rather dense peribronchial shadows, which may obstruct the fainter roentgenologic signs of obstructive pneumonitis.

When roentgenologic evidence of bronchostenosis is found, it is usually suggestive of atelectasis or, less frequently, bronchiectasis. In the case of the latter, the clinician should not confuse the syndrome of bronchostenosis complicating asthma with true bronchiectasis. Wald-bott^{2b} also made this observation during his experience with this complication of asthma. Lemon and co-workers⁵ described the roentgenologic appearance of atelectasis as a "gauze-like shadow which extends more or less fan-like from the hilum toward the periphery of the lung and is of such slight density that the bronchovascular markings can be seen through it. Often an elevation of the corresponding arch of the diaphragm is associated with it and the heart and mediastinal structures may be displaced toward the affected side." This has been repeatedly confirmed in our cases of bronchostenosis complicating asthma.

BRONCHOSCOPIC OBSERVATIONS

The commonest indication for bronchoscopic examination in patients with asthma is the need of confirming or excluding the diagnosis of bronchostenosis. When the history and the results of physical examination and roentgenologic examination suggest the possibility of a complicating bronchostenosis, the patient should have the benefit of bronchoscopic examination. The only clinical means available for determining whether benign bron-

Fig. 2—Diagram of the bronchi showing the incidence and location of bronchostenosis in 327 patients

chostenosis exists is direct observation by means of the bronchoscope. Should a stenosed bronchus be visualized, it can be dilated immediately and the retained secretions aspirated. Dilatation and aspiration alone will usually give prompt relief. When an experienced bronchoscopist is available, it is better to examine the bronchi in a suspected case and fail to find stenosis than to overlook a

⁵ Lemon W S, Vinson P P, Moersch H J and Kirklin B R. Primary Carcinoma of the Bronchus, *Southwestern Med* 16:485-493 (Dec.) 1932.

stenosed bronchus that is present and thereby subject the patient to continued and persistent cough that will invariably aggravate asthma

Bronchoscopy in such patients will reveal the usual findings of asthmatic bronchitis and, if stenosis is present at the time of bronchoscopy, a purulent secretion may be seen oozing from the narrowed lumen of the stenosed bronchus. When the stricture is dilated by means of dilating forceps, varying amounts of retained mucopurulent or purulent secretions will be found and can be aspirated. It may also be noted that the stenosed bronchus bleeds more readily when touched than does a normal bronchus.

In our series, the incidence of bronchostenosis was far higher in the right lung than in the left and, as has been previously stated, the superior division of the lower lobe is most frequently the portion involved (see the table and fig 2).

There undoubtedly are many cases in which bronchostenosis complicating asthma clears up spontaneously. Perhaps the recent frequent use of antibiotics in the treatment of the acute febrile complications of asthma has prophylactic or therapeutic value in such instances. If so, this complication will be encountered less often in the future.

Bronchostenosis may not be seen in patients who undergo bronchoscopy during an interval when they have no symptom or other evidence of stenosis, even though the history suggests previous bronchostenosis. In such cases, there usually are increased secretions and other findings encountered in cases of chronic bronchitis. In other instances, some degree of stenosis persists even after the febrile episode subsides. The presence of this stenosis aggravates the patient's cough and asthma and may lead to subsequent febrile episodes.

At times more than one stenosed bronchus may be encountered, and in these cases the stenoses may be found on one side, or they may occur on both sides of the bronchial tree. We have noted that recurrences may take place in the same bronchus, in another bronchus of the same lung, or in the other lung. At the time of bronchoscopy in patients in whom a new site is involved, the site of the original stenosis may be entirely clear. Since bronchostenosis in asthma follows respiratory infections, the prevention of recurrences seems to depend on the success of the physician in having the patient avoid or in properly treating the early stages of infections of the respiratory tract. The advice given these patients at the Mayo Clinic is (1) to avoid persons who have colds or to keep a handkerchief or surgical mask over the nose and mouth if it is necessary to come in close contact with a person who has a cold, (2) to keep warm and dry and get plenty of rest, and (3) if a cold is caught, to go to bed at once until the acute episode has passed.

COMPLICATIONS OF BRONCHOSCOPY

Bronchoscopic examination in the asthmatic person cannot be performed without some element of risk. Two of the 1,034 patients in the present study died after bronchoscopy. One died immediately after bronchoscopy and the other within a few hours afterward. No necropsy was performed in the former case, but in the latter there was edema of the medulla at postmortem examination. Both of these patients had severe status asthmaticus, and the

deaths might have been avoided if the bronchoscopy had been done with the patient under ether anesthesia. In 13 of the 327 patients with bronchostenosis, subcutaneous emphysema developed after bronchoscopy and dilatation of the stenosed bronchus. All these patients were treated conservatively, and the emphysema disappeared in 10 to 14 days. There were no deaths from bronchoscopy among the patients who had bronchostenosis.

BRONCHOSTENOSIS FROM OTHER CAUSES

Among the 1,034 consecutive patients with asthma who underwent bronchoscopy we found, in addition to the patients with benign bronchostenosis caused by inflammation, 11 patients whose stenosis was caused by a primary malignant lesion complicating asthma. In all 11 cases, malignant disease was suspected prior to bronchoscopy. In 1942, two of us (L. E. P. and H. J. M.) with Maytum⁶ reported three cases of primary carcinoma of the bronchus complicating asthma. One may also en-

counter stenosis resulting from ulceration of calcareous material into a bronchus from a hilar lymph node, tuberculosis, the presence of a foreign body, or any other cause of constriction of the bronchus, whether extrinsic or intrinsic in origin. In all such instances, correct diagnosis is crucial and usually depends on bronchoscopic examination, the additional information obtained from tissue removed at the time of bronchoscopy, cell studies using the Papanicolaou technique, and smears and cultures obtained from the bronchi at the time of bronchoscopy.

TREATMENT

The treatment of bronchostenosis, as has already been indicated, consists of dilatation of the stenosed bronchus and aspiration of the retained secretions. The results of such treatment are excellent, as measured by the relief of the patient, the subsidence of fever and severe paroxysmal cough, the eventual reduction in the amount and improvement in the character of the sputum, the improvement in the course of the bronchial asthma and, in many cases, the immediate reversal of physical and roentgenologic signs of bronchial obstruction. Recurrences can and do take place, however, as previously noted, they can best

6 Prickman L. E., Maytum C. K., and Moersch H. J.: Asthma and Primary Carcinoma of the Bronchus. *J. Allergy* 13: 261-267 (March) 1942.

be prevented by having the patient avoid or promptly treat respiratory tract infections

Patients who have asthma are usually tolerant of careful bronchoscopy as done by an experienced bronchoscopist. They should have a complete general examination and, in addition, special examinations, such as an allergic survey, examination of the nose and sinuses, and roentgenologic studies of the thorax and sinuses. Sputum when present should be examined for tubercle bacilli and malignant cells before bronchoscopic examination. If an episode of bronchostenosis is occurring and the temperature is high, the acute process should be allowed to subside before bronchoscopy is carried out. Rarely do patients with asthma object to bronchoscopy. Many patients are aware that something is interfering with the raising of their bronchial secretions, which previously had been relatively easy to raise, and are almost eager for the procedure to be done.

RESULTS OF TREATMENT

Letters of inquiry were sent to patients who were examined at the Mayo Clinic in 1950 and were found to have bronchostenosis complicating asthma. These patients all had had dilatation of the stenosed bronchi. Letters were sent also to an equal number of patients who had asthma and who on bronchoscopic examination were found not to have bronchostenosis. This control group was also treated at the Mayo Clinic during 1950. The results of dilatation of stenosed bronchi complicating asthma are similar to the results Schmidt⁴ reported in the dilatation of stenosed bronchi associated with benign, nontuberculous conditions. Sixty-six per cent of his patients obtained favorable results from dilatation, while

60.5% of the patients in our series were immediately improved after dilatation of the stenosed bronchus, and 63.6% noted some improvement during the next several months following bronchoscopy. The asthmatic status has remained improved in 60.5% of these patients. In the control group, 55% of the patients experienced some improvement immediately after bronchoscopy, the number in which there was improvement in the succeeding several months dropped to 48%, and only 45% thought the status of their asthma was improved at the time the questionnaire was received. Thus, from these results, it appears that patients who had bronchostenosis complicating their asthma received a substantial and lasting benefit from dilatation and aspiration of the stenosed bronchus, while in the control group not only were a smaller number improved but the apparent benefit was more transient.

SUMMARY

The syndrome of bronchostenosis and the records of 327 patients who had bronchostenosis complicating asthma and who were seen during the decade ending in 1950 are reviewed. All age groups were represented. The largest number of cases in any decade of life was in the age group 40 to 49 years inclusive. There were 182 female and 145 male patients in the series. Treatment of bronchostenosis consists of dilatation of the stenosed bronchus and aspiration of the retained secretions. We found that 60.5% of patients were immediately improved after dilatation of the stenosed bronchus, and 63.6% experienced some improvement during the next several months following bronchoscopy. The asthmatic status remained improved in 60.5% of these patients.

RATE OF PULMONARY AND TISSUE GASEOUS NITROGEN ELIMINATION AS A MEASURE OF PULMONARY EFFICIENCY

Walter M. Boothby, M.D., Clayton S. White, M.D., Louis Levin, M.D.
H. L. January, M.D.

and

Rodger E. MacQuigg, M.D., Albuquerque, N. Mex.

As pointed out by Fowler¹ in his excellent review on tests of pulmonary functions, one of the principal difficulties encountered by respiratory physiologists in the performance of such studies has been the lack of a satisfactory technique for the routine measurement of the residual or of the functional residual air. As a result, too little attention has been paid to the role these important

components of the lung volume may play in pulmonary function.

In 1948 Boothby, Lundin, and Helmholtz² reported a new test for pulmonary and circulatory efficiency based on the use of the nitrogen meter for measuring the rate and amount of gaseous nitrogen eliminated into a closed circuit respiration apparatus by the patient while he is breathing oxygen. The respiratory apparatus used is an elaboration of a closed circuit basal metabolism apparatus and consists of a water-sealed gasometer with a capacity of 40 liters and an air blower capable of producing a flow of at least 80 liters per minute through the closed circuit system, together with corrugated tubing and valve attached to a mouthpiece. There is a soda lime container to remove the carbon dioxide, and there are filters to remove the soda lime dust and any oil vapor from the blower. The spirometer records the respiratory movements, from which the respiratory volume, tidal air, vital capacity³ (BTPS³), and oxygen consumption

Miss Elizabeth H. Roorbach, A.B., gave technical assistance in this study.

2. Boothby, W. M., Lundin, G., and Helmholtz, H. F., Jr. A Gaseous Nitrogen Elimination Test to Determine Pulmonary Efficiency. *Proc. Soc. Exper. Biol. & Med.* 67: 558 (April) 1948.

3. BTPS = body temperature and ambient pressure saturated with 47 mm. Hg water vapor on assumption that the pulmonary temperature is 37°C.

(STPD⁴) can be calculated, as in an ordinary basal metabolism test lasting half an hour. To allow for variation in the size of the subject, the values are usually expressed per square meter of body surface (DuBois).

The essential new feature of the method is the use of one or two nitrogen meters, which are improvements of the Lilly-Anderson⁵ nitrogen meter designed by them for the United States Navy during World War II. These meters are extremely rapid and can record photographically instantaneous changes in nitrogen concentrations in inspired and expired air. The rate at which this nitrogen exchange takes place when the subject begins to breathe oxygen is important because it is indicative of the rate at which oxygen can go in and carbon dioxide come out of the alveoli. The meters are calibrated by analyzing samples obtained at the beginning and at the end of the test. The intermediate readings of the total accumulated nitrogen are linear over the range used (0 to 15%) when the water vapor content is held constant as in a closed circuit system.

The calibrated nitrogen meter readings multiplied by the volume of the gasometer readings gives the total amount of nitrogen eliminated and can be calculated for short periods as frequently as desired. In practice, readings are taken every half minute for the first 3 minutes, then they are taken every minute for the next 10 minutes, and finally at 5 minute intervals until the end of the experiment. These results are plotted on ordinary arithmetic coordinate paper and on double logarithmic paper. These plots are very characteristic and are sharply defined. The slope of the lines of both plots can be used to separate the gaseous from the pulmonary tissue nitrogen.

The ability to measure gaseous nitrogen elimination permits the following observations: 1. From the point of view of the Air Force, the early studies by Benson, Lovelace, and Boothby used by Boothby, Luft, and Benson⁶ demonstrated that in normal persons in the steady state the time required to lower below one-half the average pressure of gaseous tissue nitrogen in the body could be easily calculated, and thus the danger from decompression sickness to air crews at high altitudes could be reduced. 2. The data of accumulated pulmonary and tissue nitrogen elimination, when the patient is breathing oxygen, can be expressed as a function of time. The tissue nitrogen (after subtraction of the pulmonary nitrogen), with the patient in a steady state, plots as a straight line on log-log paper, and from this the instantaneous rate of nitrogen elimination per minute can be determined. On this rate-per-minute line for tissue nitrogen it is possible to interpolate the values at one-half and at one minute, thus permitting the determination of the circulation rate at rest and at work in subjects or patients who can "wash out" by five deep breaths all of their pulmonary gaseous nitrogen in half a minute. 3. It is possible in normal subjects, and in most patients, to determine with accuracy the volume of the nitrogen in the residual air. Thus the capacity occupied in the lungs by these subdivisions of lung volume can be calculated at body temperature and pressure, saturated (BTPS). 4. The time required under basal conditions to wash out the functional residual air of normal subjects, breathing oxygen, can also be determined. As previously men-

tioned, this is important because, if carefully done under standardized conditions, it is indicative of the freedom with which oxygen can enter the alveoli and carbon dioxide can be eliminated. This time, under strictly basal conditions, is usually between three and four minutes. In patients with pulmonary emphysema, or with large pulmonary cavities, the time required is definitely increased—in some instances to 10 minutes. An increase in the apparent pulmonary nitrogen may be due to large intrathoracic tumors of certain types, and this complicates the differential diagnosis, especially if these tumors also contain cavities or air blebs. In patients with a decreased residual and with a very small or no expiratory reserve, and who, therefore, have shallow and very rapid breathing, the wash-out time may be shortened to less than two and one-half minutes under as near basal conditions as can be obtained. 5. The tidal air and the vital capacity, which is composed of inspiratory and expiratory reserve air, are determined as in the past. In addition, the determination of the residual air and the total lung capacity increases the clinician's ability to estimate the

*Approximate Values of Pulmonary Air Divisions
Per Square Meter of Body Surface (BTPS)**

Tidal volume per breath (T V /b)	200-300 cc per square meter
Inspiratory reserve air (I R A)	1 700 cc per square meter
Expiratory reserve air (E R A)	.00 cc per square meter
Residual volume (R V)	800 cc per square meter
(Includes anatomic dead space = 70 cc per square meter)	
Functional residual volume (F R V) is the sum of E R A and R V	
Vital capacity (V C) is the sum of I R A and E R A	
Total capacity (T O) is the sum of I R A, E R A and R V	

All volume measurements are made from a line drawn along the bottom of the resting tidal volume. The level of this line in relation to the maximum inspiratory and expiratory volume may be of physiological and clinical importance. The inter-individual variability of this line is large. Its intra-individual variability can be affected by character of respiration and is probably a large component of, but not identical with, the variation of functional dead space of Douglas and Haldane.

* There is considerable variability even in normal persons.

subject's pulmonary efficiency. 6. H. Colldahl and Gunnar Lundin⁷ have recently reported, from the Allergy Laboratory of the Medical Clinic and Department of Air Medicine of the Institute of Physiology, Lund, Sweden, a very interesting study under strictly standardized conditions on the quantitative registration of the severity of asthma in provocation tests in patients suffering from asthma. They use this as an additional method to establish the causative factor and to follow the effect of treatment.

Drinker⁸ summarizes the following important estimates concerning the functioning capacity of the lungs:

4 STPD = standard temperature and pressure dry (760 mm Hg and 0°C dry).

in normal persons of average size

- 1 Alveoli—The surface for gas exchange provided by the alveoli of the lung in an adult is approximately 90 sq m. It is estimated that there are 750 million alveoli in man, and that at rest one-twentieth of their total aerating surface is used.
- 2 Capillaries—The estimated capillary area of the lungs available for gas exchange is approximately 140 sq m.

Fig 1—Nitrogen elimination curves for patient L. L. a normal subject. A curves obtained directly by the Lilly Anderson meters. The upper curve shows the nitrogen concentration in the breath by breath wash-out of pulmonary nitrogen as obtained by the nitrogen meter with sample take-off near the mouthpiece. The lower curve represents the pulmonary and tissue nitrogen as it accumulates in the closed circuit system. B, plotting of the calculated pulmonary plus tissue nitrogen elimination on log-log paper against time. The upper curve is the total nitrogen elimination of the subject and the lower curve is the same data expressed per square meter.

This huge surface, by virtue of the net-like arrangement of the capillaries, is very readily available for even distribution, without serious pressure changes, of the volume of blood thrown into it by each ventricular contraction. It is perfectly adequate for receiving all the blood that comes to it—approximately 4 liters per minute at rest to over 30 liters per minute at work—even when changing back and forth very rapidly from rest to work.

In the table are the numerical values frequently found in normal persons for the important subdivisions of the pulmonary air, expressed at BTPS. Variations in the size of the person are roughly allowed for on the basis of square meter surface area as we are accustomed to do for the basal metabolic rate, however, the variation, even in normal persons, is much greater than are the variations in basal metabolism, and they depend on many as yet incompletely studied factors.

In an analysis of the two nitrogen elimination curves (fig 1A) in a normal subject, the upper curve, because of the variation in water vapor in inspired and alveolar air, and because of the difference in amount of carbon

dioxide, is only approximately quantitative. Nearly all of the pulmonary nitrogen is washed out in about two minutes after the subject starts breathing oxygen. The subject was not under basal conditions, therefore, the respiratory rate was increased. Ordinarily, in the normal person under strictly basal conditions the wash-out time is approximately three to four minutes. The lower curve, depicting the pulmonary and tissue nitrogen as it accumulates in the closed circuit system, represents the oxygen-nitrogen concentration quantitatively, because the water vapor is constant and the carbon dioxide is removed. The salient feature to be noted here is that, after about 12 seconds delay, owing to time required for mixing in the closed circuit apparatus after the change over to oxygen, there is a marked rise in the accumulated nitrogen with sample take-off on the inspiratory side of the closed circuit system. By means of a calibrated scale, the percentage amount of nitrogen accumulated in the gasometer circuit can be determined and the total amount of nitrogen eliminated easily calculated from the gasometer volume. The characteristic bend or knee in the nitrogen elimination curve (fig 1B), which separates pulmonary from tissue nitrogen, occurs at two minutes. It is the moment at which essentially all the pulmonary nitrogen has been eliminated, and from that point onward to the right the curve is an expression

Fig 2—Nitrogen elimination curves for patient L. S. who had marked cardiac decompensation and pleural effusion and therefore decreased residual nitrogen. A the pulmonary wash-out required about 1.9 minutes as is shown in the upper curve. The lower curve represents the accumulation of the pulmonary and the tissue nitrogen. B the upper curve represents the standard respiratory curve and the log-log plot the lower curve shows that the amount of residual air was small.

of tissue nitrogen elimination, the rate of which is mainly dependent in normal persons on circulation rate. This portion of the curve, after subtraction of the pulmonary

nitrogen, has been shown by Boothby, Lovelace, and Benson to be a straight line in normal persons on log-log paper for at least 150 minutes. Subsequently, Boothby, Lundin, and Helmholz² found this straight line relationship of tissue nitrogen in normal persons under basal conditions to last for five hours. The spirometer respiratory curve shows an average tidal volume of approximately 410 cc per square meter per breath. The inspiratory and expiratory reserve air values can be calculated from the maximal inspiration and expiration. The sum of these is the vital capacity. The level of the tidal air in relation to the inspiratory and expiratory reserves varies greatly even in normal persons, thus affecting the functional residual air volume. The interindividual residual air is less variable than the functional residual air, provided the subjects can readily expire completely.

The nitrogen elimination curves obtained for a patient with marked cardiac decompensation and pleural effusion as shown by x-ray examination showed the pulmonary nitrogen wash-out to require about 19 minutes (fig 2A). The pulmonary nitrogen level was very low, indicating a marked decrease in freely functioning alveoli.

The standard respiratory curve is shown at the top in figure 2B. The breathing is rapid and shallow. The subject has practically no measurable expiratory reserve (30 cc) and an inspiratory reserve of only 410 cc, therefore, the vital capacity was only 440 cc, of which about 250 cc were tidal volume per breath. Each breath, therefore, was more than half of the extremely small vital capacity, and, in consequence, there was almost no reserve for even minimal exercise. The log-log plot showed that the residual air was small, amounting to only 570 cc per square meter, or a total capacity of only 1,010 cc. As could be expected, this patient was practically bedridden.

In a person who has had a tentative diagnosis of pulmonary emphysema of many years' standing (fig 3) the differentiation between pulmonary and tissue nitrogen is less distinct than in normal subjects and, therefore, complicating factors may be indicated. The spirometer graph demonstrates the fact that the ventilation per minute is greatly increased, mostly as a result of the rapid breathing with a small increase in volume per breath. The inspiratory and expiratory reserves are greatly diminished below normal. The residual air is greatly increased. Following the three maximal breaths there is indication of inability to expire. Helmholz⁹ has shown marked examples of this phenomenon, which he labeled "air trapping." The bar graph shows that the residual air is over three times as great as that seen in the normal person. Apparently, in order better to aerate this enlarged residual air volume, the tidal volume is moderately increased. The data suggest that possibly in some patients the residual air should be divided into two parts: (a) the free residual air and (b) the restricted residual air of cavities or "blebs."

SUMMARY

The purpose of this paper is to call attention to some of the information in regard to pulmonary function that can be obtained and recorded by new types of instruments, especially the nitrogen meter constructed during World War II at the Johnson Research Foundation, Philadelphia, under director Detlev W. Bronk. We have

presented three examples in which the rate and the amount of pulmonary nitrogen elimination was studied in addition to the usual diagnostic procedures for estimating pulmonary efficiency. One of the examples is a normal person, another is a patient with decreased residual nitrogen, indicating an exceedingly small volume of functioning pulmonary tissue, that is, of freely open alveoli, and the third is a patient in whom the residual nitrogen is very greatly increased, probably from several causes, such as dilatation of alveoli, cavities, and intrathoracic tumor tissue.

There is no doubt that, in the near future, the nitrogen meter and other instruments of this type that can be used

Fig. 3—Nitrogen elimination curves for patient G. B. who had pulmonary emphysema of many years' standing thereby creating increased residual nitrogen. A the upper curve indicates the extremely long pulmonary wash-out time of nine minutes. It was difficult, on the lower curve to differentiate pulmonary from tissue nitrogen. B the differentiation between pulmonary and tissue nitrogen is more distinct on log log paper.

to estimate pulmonary function can be improved. The terminology used by the clinician, by the surgeon, by the respiratory physiologist, by the roentgenologist, by the anatomist, and by the pathologist must be gradually modified and harmonized in order to correlate the functional data with the anatomic findings both in health and in disease. At the present time this method of study of pulmonary function, with new instruments, is comparable in development to that of the roentgen ray two score years ago. This has indeed been an interesting era of diagnostic development brought about by specialists in each field. The problem of the future will involve correlation of the various types of investigation.

PROBLEMS OF ANESTHESIA FOR SURGICAL PROCEDURES WITHIN THE CHEST

McKinnie L. Phelps, M D

and

John C. McAfee, M D, Denver

Surgical procedures involving opening of the thoracic space have multiplied in incidence and variety many times in the past decade and even in the past five years. With the advent of new techniques and drugs, surgery involving the lungs has become commonplace as compared with 1942. Esophageal surgery, ranging from that for carcinoma in the aged to repair of tracheoesophageal fistula in the newborn, is capably done over the entire country. Certain neurosurgical procedures may involve entry into the pleural space, and intrathoracic cardiac or vascular surgery has been developed in recent years to a spectacular degree. Most sizable communities are beginning to regard operations on the mitral valve or coarctation of the aorta as operations with definite indications and predictably bright prognoses. Such being the case, it seems desirable that referring physicians should have some conception of the problems, accidents, and complications encountered in the operating room in the course of such procedures.

The conclusions presented in this paper are drawn entirely from several years of private practice in anesthesia. During the past four years, we have conducted the anesthesia for about 1,600 intrathoracic operations, including 1,350 pulmonary procedures and 150 cardiac or vascular operations. In the latter group are such cases as mitral or pulmonary stenosis, aortic coarctation, and patent ductus arteriosus. In addition, there were 25 cases of tracheoesophageal fistulas, 50 cases of esophageal resection, and a number of cases of miscellaneous disorders.

CHOICE OF ANESTHETIC

There is some difference of opinion, or at least of emphasis, concerning the choice of anesthetic agents to be used as well as the techniques to be employed. Much has been written on this subject, and it does not seem necessary to discuss it fully at this time. It is increasingly self-evident, however, that the particular agent used is of far less importance than the ability of the anesthesiologist. Ether probably is used more frequently than other agents for intrathoracic procedures, because respiration is deeper and less manual control is required on the part of the anesthesiologist. Ether is slower acting, and the plane of anesthesia is, therefore, more easily maintained at a given level than is the case with cyclopropane. It is possible that ether affords more protection than other agents against cardiac arrhythmias. Cyclopropane also has considerable value in anesthesia for chest surgery. Rapid inductions and intubations with thiopental (Pentothal) sodium, curare, and cyclopropane subject the patient to far less physiological trauma, if carefully done, than do slower procedures. Early intubation permits a good patent airway with immediate facilities for suction,

if necessary, as well as for a change of agent to ether, if desired, without the intervening complication of laryngospasm. Such techniques must, however, be carefully individualized to fit the particular situation presented by each patient.

RESPIRATORY PROBLEMS

There are many problems encountered during the surgical procedure, the first general group of which are those related to the respiratory system. By the nature of the surgery, such cases present the problem of an open chest and a collapsed lung. They require, therefore, use of endotracheal techniques, whether in the aged or the newborn. The latter, in particular, require highly specialized equipment, from a wide selection of endotracheal tubes to breathing bags and soda lime absorbers of a size to correspond to the tidal volume of the patient.

Laryngeal edema as a result of endotracheal intubation is rarely a significant factor in adult patients. The post-operative occurrence of this complication is seen more frequently in infants. In most instances, steam inhalations are sufficiently efficacious, although on rare occasions tracheotomy may be indicated. In any case, the considerable advantages of an endotracheal airway greatly outweigh the infrequent complications that may result from its use.

The very existence of a collapsed lung presupposes the necessity at any time or at all times of the use of techniques of controlled or compensated respiration. With a mobile mediastinum, the problem of paradoxical breathing is almost constant. Thus the anesthesiologist is torn between his responsibility to maintain an adequate tidal volume by means of positive pressure controlled techniques and a desire not to balloon the lungs overmuch into the surgical field.

The appearance of secretions, pus, or blood in the bronchi is a common occurrence that may, on occasion, lead to serious respiratory obstruction and asphyxia. The anesthesiologist must be constantly on the alert for the sudden appearance of massive hemorrhage, the gradual accumulation of bronchial secretions, and obstruction of the bronchi by debris, such as pieces of free cancer tissue. Suction facilities must be good and instantly available, and the head-down position should be used in urgent circumstances. The widespread preoperative use of the antibiotics has almost led to the disappearance of the so-called wet cases of bronchiectasis, in which pus literally poured from the endotracheal tube. This has almost obviated the need for afternoon schedules that permit planned drainage of the tracheobronchial tree.

Surgery and anesthesia in asthmatic patients often present special and sometimes serious problems. These patients occasionally have large quantities of thick, glairy mucus in the bronchial tree, which is difficult or impossible to remove. Bronchospasm may be present

initially, leading to slow difficult inductions, or may develop at any time during the procedure. Since bronchospasm is mediated by vagal stimuli, the use of thiopental sodium or cyclopropane is theoretically contraindicated, and ether, which has a sympathomimetic action, is usually the agent of choice. Increased dosage of atropine or scopolamine before or during the anesthesia may be helpful in blocking vagal action.

Of all the preexisting pulmonary complications, the presence of advanced emphysema is perhaps the most serious. In patients with this condition anesthetization is often slow and oxygenation difficult. The recovery of the patient following anesthesia may be relatively delayed, under circumstances in which it is especially desirable that the patient regain his cough reflexes. Far advanced emphysema is often coupled with an increased load on the right ventricle, and complete or partial resection of one lung may place an increased and sometimes lethal burden on the heart. Any reduction of the oxygenating capacity of the lungs may be serious. Especially in this type of patient, careful preoperative evaluation of pulmonary function is essential.

CARDIOVASCULAR PROBLEMS

Cardiovascular problems and complications are legion in cases of surgical intervention for the correction of such developmental defects as patent ductus arteriosus and coarctation of the aorta or for the improvement of efficiency of the heart and circulation in mitral stenosis and tetralogy of Fallot. They run the gamut from hemorrhage and shock to hypertension and cerebrovascular accidents, from simple, relatively benign arrhythmias to cardiac arrest. The nature of the pathological condition involved, with resultant alterations in hemodynamics, blood oxygen saturation, and cardiac irritability and reserve, makes the occurrence of the complications probable rather than the reverse. The predictably good results these patients may enjoy today have been made possible only by the combination of several factors: careful preoperative evaluation of the patient, adequate preparation before surgery, close attention to detail, and the invaluable aid of a competent cardiologist and the making of a continuous electrocardiographic tracing during the operation.

Arrhythmias are high on the list of complications that cause concern in the operating room. The cause of arrhythmias is not always clear. Many patients come to surgery arrhythmic, most commonly with auricular fibrillation. Merely opening the chest may cause the heart to beat irregularly. Certainly the opening of the pericardial sac, handling of the heart itself, injection of the base of the auricular appendage, application and removal of clamps, and other factors may at times cause a variety of arrhythmias. Undoubtedly, suboxygenation makes the heart more irritable and increases the likelihood of the occurrence of the more serious abnormal rhythms. Many arrhythmias can not be detected by ordinary blood pressure and pulse determinations. A successful outcome is more assured if an electrocardiograph is attached to the patient on the operating table and a cardiologist is present to interpret the readings and advise on the proper drugs and dosages to be used.

One of the commoner occurrences is a significant change in rate of the heart, with or without a change in

pressure. Usually the heart rate gradually becomes more rapid during surgical intervention for mitral stenosis. On occasion, however, the rate may become too rapid too early in the procedure. Intravenous administration of 0.15 cc of a 1:2,000 solution of neostigmine (Prostigmin) effectively slows the rate. In some cases, there occur a rising rate, a falling blood pressure, a narrowing pulse pressure, and an electrocardiographic tracing showing left ventricular strain. The drug of choice here may be lanatoside C (Cedilanid), 1 to 2 cc given intravenously. Occasionally, the development of a bradycardia may indicate increased vagal tone. Administration of 1/300 grain (0.2 mg) of atropine intravenously is often helpful in this circumstance. A bradycardia that does not respond to atropine is of grave significance. It is seen oftener in cyanotic patients, such as those with tetralogy of Fallot. If it occurs early and does not respond to drugs or to inflation of the collapsed lung, the termination of the case may be fatal. Occasionally, the blood pressure drops to a level sufficient to cause concern, with no change in rate and no material change in the electrocardiographic tracing. Administration of 0.5 to 1 cc of a mild vasopressor has proved beneficial in such instances.

PROBLEM OF BLOOD LOSS

The problem of blood loss and its replacement is ever present in this type of surgery. During some mitral valvulotomies, the blood loss may not exceed 200 or 300 cc, but during the resection of a coarctation of the aorta, it is common for the patient to lose 1,000 to 1,500 cc in opening the chest, for collateral vessels in the chest wall are large and numerous. There is always the possibility of a sudden accidental loss of blood in considerable quantity. Blood typing and cross matching should be done on all patients, and an adequate supply of blood should be available at surgery, 1,500 cc is the amount usually on hand before surgery begins. More is ordered as surgery proceeds and as circumstances indicate. As soon as the patient is placed in position, a needle of adequate bore, from 15 to 18 gage, is introduced into a suitable vein in the hand or forearm. A sphygmomanometer pump is at hand to speed the administration if it becomes necessary. Exposing the vein for introduction of the needle is rarely necessary, except in cases of infants and small children.

The amount of blood administered varies with each patient. The objective is always to replace blood while it is being lost. At the same time, it is important not to overload patients who are old and debilitated or those whose cardiac reserve is poor. Blood loss is estimated from that collected in the suction bottle and from the number, size, and saturation of the sponges. Observation of the patient's color, skin temperature, capillary return, blood pressure, and pulse pressure is helpful in estimating whether there is need for more speedy blood replacement.

TIME FACTOR

The factor of time is exceedingly important in this type of surgery and anesthesia. It has been fashionable in recent years to say that, with good anesthesia and other modern facilities, time is an unimportant factor. Even assuming that the best anesthesia and surgical ability are provided and that blood replacement is good, the elapsed time is one of the major factors in the ultimate welfare

of this group of patients. The time anticipated for a surgeon to complete a given procedure in a poor risk patient may be the final determining factor in deciding whether to operate in the first place. The good, rapid surgeon certainly will have a far wider selection of procedures and patients than will the good, slow surgeon.

Most of the adult patients in this type of practice are physiological cripples. They are usually patients with seriously impaired pulmonary or cardiac function or both. The unrelenting processes of disease and old age, coupled with major surgical procedures often involving the impaired organs and basic physiological functions, make necessary the extremest care in planning such operations. It must be borne in mind, furthermore, that some of this group of patients may have so little pulmonary or cardiac reserve that major intrathoracic surgery simply cannot be considered. Errors of judgment in this area perhaps account for the great majority of deaths in any large series of intrathoracic surgical cases. The newborn baby with a tracheoesophageal fistula will, on the other hand, often withstand the most astonishing degree

of abuse at the hands of both the surgeon and the anesthesiologist, because he usually possesses a good heart and a good pair of lungs.

CONCLUSIONS

In closing, it must be emphasized that all of the many segments of the problem discussed enter into selection of patients for chest surgery and determination of the prognosis. All or most of the criteria mentioned must be met for surgery to be permitted. These many elements include the skill, judgment, and speed of the surgeon, the skill and judgment of the anesthesiologist, and the ready availability of any amount of blood required, coupled with the early recognition and immediate, unruffled treatment of crises by both surgeon and anesthesiologist working together as a friendly, sympathetic team. With a combination of such factors present, many lifesaving, health-giving surgical procedures may be made available to an increasingly large group of patients otherwise destined to a life of chronic ill health or early death.

BLOOD GROUPING TESTS FOR EXCLUSION OF PATERNITY

RESULTS IN ONE HUNDRED EIGHT CASES

Lester J Unger, M D , New York

The scientific foundation on which the value of blood tests in paternity disputes rests is the individuality of different persons' blood and the fact that the characteristics that determine this individuality are inherited according to definite principles. All inherited characteristics are determined by genes, which are present in rod-like bodies called chromosomes. These latter occur in pairs in the somatic cells, and one member of each pair is present in the nucleus of the male sperm and in that of the female ovum. Thus, each parent makes an equal genetic contribution to the blood group characteristics present in the red blood cell envelop of their offspring. In 1900 and 1901, Landsteiner discovered two of these blood group characteristics, which he called the A and B factors. Four combinations of these determine the blood groups of the A-B-O blood group system. Since

then, however, the matter of blood groupings has become complicated, because, by now, more than nine independent blood group systems have been described, which determine more than 50,000 varieties of blood. Thus, the complete blood grouping of a person may some day become almost as distinctive as his fingerprint.

With the acquisition of this scientific knowledge, its value for the solution of medicolegal problems has been established.¹ It seems worth while to report this series of 108 cases of disputed paternity, since only two other workers using three blood group systems have reported significant series of cases.² These tests have been used both in the United States and abroad. The states of New York, Wisconsin, Ohio, New Jersey, Maryland, South Dakota, North Carolina, Maine, and Pennsylvania have laws giving the courts power to order blood grouping tests when indicated in paternity disputes.³ In states where no such law exists, tests can be carried out with consent of the parties involved, and the results are admissible as evidence. These tests may exclude paternity but can never prove it. While the results of an exclusion are admissible in evidence, they are not necessarily binding on the court. In my series, when the results proved non-paternity, they were accepted as conclusive, and the outcome of the case was decided largely by results of the tests. Even though the blood tests cannot be used to prove paternity, a husband with merely doubt about the paternity of his child may derive great comfort if they fail to exclude paternity. In such instances, the results may deter legal action and actually save the marriage.

Proper performance and interpretation of the tests demands special knowledge, training, and experience.

Therefore, only qualified experts should undertake medicolegal cases of this nature. It is difficult to define the qualifications of an expert, but wide experience in the field is most important. The extent and quality of that experience can best be judged by the positions held and by the scientific work published. The tests, especially those for the Rh-Hr factors, are delicate and must be carried out meticulously to guarantee accurate results. Correct interpretation of the results requires experience and knowledge of both immunohematology and genetics. An understanding of the qualitative differences in the various agglutinogens is essential, for example, in the A-B-O system there are variations of the A agglutinin designated as A₁, A₂, A₃, A₄, and so forth, here arranged according to the strength of their reactions with anti-A serum. The weakly reacting varieties require extremely potent serums. These differences of the A agglutinin are not, at present, made use of in the exclusion tests.⁴ A variant of the N factor, called N₂, is found only associated with M, giving rise to the type MN₂. This weakly reacting antigen can be detected only with special anti-N serum, otherwise the blood may erroneously be considered to belong to group M. Great care must be taken to avoid this pitfall. In the Rh-Hr system there are also weakly reacting antigens called variants,⁵ which must be carefully taken into consideration to avoid error. The most important one is the Rh₀ variant, Rh₀. Unless this factor is tested for by a special technique, such as person may erroneously be classified as Rh negative.

METHODS

Evidence submitted by the expert pertains to the results of examinations of the blood of persons involved in the dispute. The examination consists of a series of tests to determine the presence or absence in the red blood cell membrane of characteristics called agglutinogens. Of the various blood group systems now known,⁶ only three are used medicolegally, namely, the A-B-O, the M-N,⁷ and the Rh-Hr systems. (The S and s factors,⁸ which form part of the M-N system, are not tested for, because such small quantities of the antisera are available that they are used only for research and not for routine work.) The P, Lewis, Lutheran, Kell-Cellano, Duffy, and Kidd groups are not used at present for medicolegal purposes. As pointed out in a recent report,⁴ the reasons for omitting these are that satisfactory, specific diagnostic serums are not available, that certain characteristics are demonstrable only by the indirect antiglobulin method, or that the mechanism of heredity is not as yet clearly established.

To determine the presence of the various factors that comprise the three systems used, a specimen of blood of each person involved in the controversy is obtained, preferably from a superficial vein. In certain instances, especially in newborn infants, capillary blood may be obtained by pricking the finger or heel. As far as the reliability of the tests is concerned, such capillary blood is equal in value to venous blood. The only precaution necessary is to be certain to obtain an amount sufficient to carry out all the necessary tests. Prior to drawing each specimen of blood, the name of the person is written on labels. As a check against typographical errors, additional information, such as "mother," "putative father"

or "child" together with the age of the child if more than one is involved, is also put on the label. These labels are then attached to test tubes prior to actual drawing of the blood. When blood has been drawn and placed in the test tube, the operator again reads the label on the test tube to be absolutely certain that it bears the name of the person who donated the specimen. For further identification, fingerprints are taken, and in newborn infants footprints may be added.

The red blood cells of each person are washed with isotonic sodium chloride solution and a 2% suspension prepared. A series of tests is carried out on the cell suspensions, using antisera for A, A₁, B, M, N, Rh₀, rh', rh'', hr', and hr'' factors. In fact, each of the tests should be made in duplicate with two different samples of each of these antisera. A series of control cells the blood factors of which are known are also similarly examined. The serum of each person is tested against red blood cells known to belong to group O, A₁, A₂, and B. If the factor tested for is present, clumping of the cells results, whereas, if the factor is absent, no clumping results.

RESULTS WITH REPORT OF CASES

Each of the three blood group systems utilized contributes to the total chance of excluding paternity by a man falsely accused of being the father of a given child. The chance of doing this by the A-B-O system is about 18%, by the M-N system about 18%, and by the Rh-Hr system about 25%. When all three systems are used simultaneously, the chance is greater than 50%.

In the present paper, the results in 108 cases of disputed paternity are analyzed. In all cases, the blood samples were examined for the various factors of the A-B-O, M-N, and Rh-Hr systems, two different examples of each of 10 different antisera being used. In some instances, examination for one or both Hr factors was obviously unnecessary, and the test was then omitted. Except for the earliest cases in this series and except in cases in which the test was obviously not indicated, the hr'' factor was tested for, two different samples of anti-hr'' serum being used.

The following basic principles, or laws, form the basis for the determination of nonpaternity: 1. Agglutinogens A, B, M, N, Rh₀, rh', rh'', hr', and hr'' must be present in the blood of one or both parents to be present in the blood of the child. 2. A group AB parent cannot have a group O child, a group O parent cannot have a group AB child. 3. A type M parent cannot have a type N child, a type N parent cannot have a type M child. 4. An hr'-negative parent cannot have an rh'-negative child, an rh'-negative parent cannot have an hr'-negative child. 5. An hr''-negative parent cannot have an hr''-negative child, an rh''-negative parent cannot have an hr''-negative child. (Serums for factor hr'' factor are rare, so that the

number of studies on this factor is small. For this reason, exclusion of paternity based on the hr⁺ factor must be qualified. For other reasons,⁹ exclusions based on this law¹⁰ call for slight qualification.)

The basic principle, namely, that characteristics present in the child's red blood cells are determined by joint contributions of the two parents, is identical in every case. If the examination shows that the child's cells contain factors not present in the blood of the couple involved, one is not or perhaps neither is a parent of the child. In the present series, the tests failed to show nonpaternity in 78 instances. A man not excluded by the tests may, nevertheless, really not be the father, because by coincidence his blood may contain the same charac-

teristics as those of the actual father. To illustrate situations unsolvable by blood tests, the following interesting cases are reported.

CASE 1—A woman went to Florida while her husband remained in New York. About a year and a half later, she had a child, although she had at no time lived with her husband during that period. At the time of the child's birth, there was no dispute, in fact, the woman made a frank confession of the facts to her husband. When the child became about 3 years of age, the mother's friends prevailed on her to demand that her husband support the child. Blood tests failed to exclude the husband as a possible father of the child.

CASE 2—A woman, about 40 years of age, almost immediately after her marriage to a wealthy man, about 65 years of age, told him she was pregnant. The husband was delighted. The obstetrician referred these two persons to me for examination of their blood, since examination for the Rh factor is now routinely carried out by almost all obstetricians. Both the prospective mother and her husband proved to be Rh negative. The obstetrician explained to the woman that she was fortunate and that there was no need for worry, because her baby would certainly be Rh negative and therefore, could in no way be adversely affected because of Rh incompatibility. The following day the woman, evidently upset, insisted on seeing the obstetrician immediately and questioned him in regard to his statement that the child would with certainty be Rh negative. She wanted to know if there was any possibility that the infant might be Rh positive and whether it would be absolutely essential that the newborn baby's blood be examined and a record made of the report on the infant's chart. After being told that it would, she confessed that this child was not that of her husband but that of her lover whom she knew to be Rh positive. The obstetrician then had her return to me, and by arrangement, the blood of the father, who was then in Florida, was drawn by a local physician and sent to me by air mail. His blood proved Rh positive, but fortunately it was heterozygous. I explained to her that even though the father was Rh positive, since he was heterozygous, there was a 50-50 chance that her baby would be Rh negative. In that case the results of the examinations of her husband could not be used against her to exclude him as a possible father of the child. Actually, when the child was born, he proved Rh negative, and the husband, ignorant of the wife's deception, believed the child his own.

CASE 3—Two men, one about 23 years of age and the other about 60, were admittedly intimate with the same woman. Each was aware of this. The woman became pregnant and gave birth to a child. The parties concerned consulted me because they wished to know which one was the father. They agreed that if either one was excluded the other would marry the girl and give the child his name. The blood examinations failed to exclude either of the two men. Youth and romance prevailed. The woman married the younger, poorer man.

CASE 4—The following interesting case is one that illustrates both the inability of blood tests to exclude paternity and also the lengths to which a man may go to prove his point. A married man wished to be divorced. Although he believed the child his wife had borne was his, he hoped that the contrary would be proved and therefore, requested blood tests. He discussed his problem with a friend, who came up with the idea that since the husband believed that the child was his and the friend certainly had not sired this child, if the friend substituted for the husband and had his blood examined, there would be a better chance of obtaining results beneficial to the husband's case. Examination of the blood of the admittedly innocent friend failed to exclude him as the father. In the meantime, the husband was either smitten with a guilty conscience or wished a second opportunity to prove and confessed the deception to his attorney, who promptly got in touch with me and gave me the facts. It was agreed that this time the attorney would come in person to my office with the litigant and identify him. An examination of the husband's blood failed also to exclude him as the father. It is almost impossible to get all parties concerned together simultaneously for mutual identification, and it is possible that this deception has occurred in other cases. I resort to taking fingerprints of all parties as a means of identification. It must be recognized, however, that even with this safeguard, as illustrated in this case, substitution may be attempted. In this particular instance, it failed.

In this series, definite exclusion of the accused men was possible in 30 cases: in 8 by A-B-O factors alone, in 8 by M-N factors alone, in 8 by Rh-Hr factors alone, and in 6 by two of the three systems used. In two of these last six cases, paternity was disproved by A-B-O and M-N factors, in two by A-B-O and Rh-Hr factors, and in two

⁹ Wiener, A. S., Gordon, E. B., Cohen, L. A. New Rare Rhesus Agglutininogen Am J Human Genet 4: 363-372, 1952.

by M-N and Rh-Hr factors (see the table) There were no triple exclusions While in almost every case where indicated tests were made for the hr' factor, in no case was it possible to base an exclusion on this factor Case 19 in the table is interesting from a immunohematological standpoint, because the putative father belonged to type Rh,Rh₁, which is rare, occurring less than once among 1,000 persons In three cases in this study two children were involved and in one three children were involved In one of the former cases, the husband was excluded as the father of the younger but not of the older child (case 29 in the table), and in another the husband was excluded as the father of the oldest but not of the two younger children (case 15 in the table) In two cases, the husband was excluded as the father of both children (cases 2 and 23 in the table) The following two cases are interesting examples of cases of exclusions

CASE 5—A young American soldier, who happened to be an attorney, fell in love with a young woman while stationed in Germany He would gladly have married her, but at that time marriage was not permitted He was transferred to the north, and subsequently, when he was to be shipped home, he asked to be routed through the town where the woman in question lived When he arrived unexpectedly, he noticed a man's picture in her bedroom, but at the moment he disregarded it and only later did he realize its relevance He remained with her one night and then went on his way to the United States Almost nine months to the day after this last visit, the woman had a baby, to whom she gave the first name of the man whose picture had been seen in her bedroom Yet the young man, without question, assumed that the child was his As soon as the law permitted, he sent the woman funds and arranged that she and the child be brought to this country, where he married her Quarrels, bickering, and unhappiness followed almost immediately When the child was 3 years old, the mother taught him to say Heil Hitler, and at this point the man moved out of his home He took steps to have the marriage annulled, but even though he was an attorney he failed to have blood tests performed He lost his case but still refused to live with or support his wife As a result of her efforts to obtain money from him, he consulted an attorney, who referred him to me The results of the blood grouping tests on the three persons involved were such that I was able to exclude the husband as the father of the child The hr' factor was the basis of the exclusion The young man obtained a verdict in his favor The number of cases recognized by the courts and based on the hr' factor is few This is one of them (case 18 in the table)

Various motives prompt the demand for blood tests Usually, in my series, it was the desire of the husband to obtain a divorce and escape financial obligations In other cases, the husband was convinced that his wife had been unfaithful to him, and he no longer wished to live with her Even if the blood tests fail to exclude the husband as the father, the home probably is broken, because a marriage could hardly be expected to survive a husband's accusation that his wife has been unfaithful In the following case, the motive was unusual

CASE 6—A woman frankly admitted that her child's father was not her husband but her husband's best friend Both the husband and wife had interest in persons other than one another The wife wished, however, to keep possession of the child who had been sired by her lover On the other hand, the husband wished returned to him the house he had bought and had put in his wife's name at a time when they had been living together happily This she refused to do The husband then tried to use the child as a hostage, refusing to relinquish his right to the child unless the wife returned the house to him The blood tests made at the wife's request excluded the husband as the father of the child She kept both the child and the house (case 17 in the table)

COMMENT

The total number of disputed paternity cases irrespective of whether exclusion results is small in comparison to the number of mother, father, and child combinations in which tests are made to determine the possibility of the occurrence of erythroblastosis in a newborn infant Obviously, in this latter group, which is large, paternity is not in dispute A happy and joyous event is in the offing In a group of several thousand such cases in which I have performed blood tests, the percentage of exclusions is virtually nil In fact, this occurred in only one case, and the finding was accidental This is the reason for the acceptance of the tests as evidence As Wiener has pointed out, there are no exceptions to the rules of inheritance of these factors that cannot be explained by either error in technique or illegitimacy In cases in which a dispute is involved, naturally the percentage of exclusions is considerably higher The case in which exclusion of paternity was an accidental discovery was interesting¹¹ The infant required a transfusion, and the laboratory had difficulty in finding a compatible donor The case was then referred to me It was found that the blood contained an anti-M agglutinin, although the child had received no previous transfusions or injections of blood A naturally occurring anti-M factor is rare and unusual Stimulated by scientific interest, I tried to obtain blood samples from the mother, father, and if possible, the grandparents All members of the family except the mother of the child promptly responded It was only after use of great pressure that she reported and permitted the drawing of a blood specimen The fact that I was so insistent about getting the blood of the mother aroused suspicion in the mind of the grandmother At first, she resented my persistence, but, suspecting that the tests were for paternity, she feigned indignation and surprise that I even suspected her daughter of being unfaithful to her husband, however, she soon admitted that she also had been suspicious The test proved that the husband was not the father of the child In most cases in this series, the man involved denied paternity In 13 instances the child was born out of wedlock, while the remainder of the couples involved were married In none of my cases was the maternity of the child questioned

The psychological reaction of the mother at the time the tests are performed is interesting It has varied from complete indifference to complete confidence in the outcome of the tests At times the mother has shown righteous indignation as well as contempt for the man subjecting her and her child to what she considered an indignity In cases in which exclusion of the accused man has been established, it might be expected that there would be some resentment directed toward the examining physician, but in my experience this has not occurred

SUMMARY

The cell envelope of erythrocytes has various characteristics that can be identified by means of specific antisera These characteristics are inherited according to certain laws, and each parent makes an equal genetic contribution to the characteristics in the red blood cell envelope of the offspring These characteristics establish

11 Unger L J Wiener A S and Sonn E B Problems in Blood Grouping in Relation to Transfusion *Am J Clin. Path* 16 45-48 1946

at least nine independent blood group systems, resulting in more than 50,000 different varieties of blood. Thus, the complete blood grouping of a person may some day become as distinctive as his fingerprint. At the moment, for various reasons, only three blood group systems are made use of for medicolegal purposes, namely, the A-B-O, M-N, and Rh-Hr systems, and when they are simultaneously utilized, about 50% of men falsely accused of paternity can establish their innocence

Although these blood tests may exclude paternity, they can never prove it. Nevertheless, on occasion, even non-exclusion, although not proving paternity, has allayed a husband's suspicions and saved a marriage. In a series of 108 cases, 30 falsely accused men were excluded as fathers of the children involved in the dispute. The results were accepted as conclusive and largely determined the outcome in each case.

SOFT TISSUE CALCIFICATIONS IN CORD LESIONS

Miriam Liberson, M D, Rocky Hill, Conn

The interest in soft tissue calcifications in cord injuries arose after World War I when a number of wounded veterans exhibited that type of injury. Special hospitals for paraplegics were established. A great number of such patients were studied by a group of French neurologists, orthopedists, and pathologists. As a result of this study an interesting paper was published in 1919 by Mme Déjerine¹ and her co-workers. This was a comprehensive study, and the French authors' observations and deductions as to the clinical, anatomic, and pathological aspects of the soft tissue calcifications in cord injuries still hold true and have served as a basis for later studies. This paper is the only one up-to-date that offers an extensive pathological study of 11 cases.

As described by the French authors, these calcifications show the following essential characteristics: 1. They always appear below the level of the cord lesion. 2. Their points of predilection are in the vicinity of the hip joint, the medial femoral condyle, and the knee joint; the joints proper are never involved; the calcifications may be single or multiple. 3. These calcifications appear early after injury, progress rapidly, and develop in areas where no previous hemorrhage or infection was observed. 4. The pathological anatomy studied in 11 cases showed grossly either compact bony nodules or a fine lacework of spongy bone along the diaphysis. At the hip joint a sort of bony scaffolding in three parts was observed—*anterior, inferior, and sometimes posterosuperior*, the bony bridging thus surrounding the capsule and, in certain cases, greatly interfering with the motion of the joint. Histologically, osteoblasts, cartilage cells, and adult bone were found; the trabeculae, often irregular in distribution and uneven in thickness, circumscribe medullary spaces containing normal blood-forming marrow cells.

Between the two world wars little was written on the subject of soft tissue calcifications in paraplegics. World War II brought a definite revival of interest in this problem, since a great number of paraplegics came under observation. Most of these patients are grouped in special services of the VA hospitals throughout

the country. There they are studied and treated, with special consideration given to the possibilities of their rehabilitation. A number of papers dealing with the problem of soft tissue calcifications have come out of these VA hospitals.² In most of these recent papers the original description of Déjerine and her co-workers has been confirmed as to the frequency, date of appearance, distribution, and pathology of these lesions. Abramson³ stressed again the early appearance of the soft tissue calcifications (as early as 20 days after injury), the same is true of urinary calculi, which occur with great frequency in these patients. The calcifications progress in size only to a certain point, they then become stabilized. In Abramson's series no connection between the site or the severity of the lesion and the location of the calcifications was found.

A total of 52 paraplegics or quadriplegics have been hospitalized up to date in the Chronically Ill Section of the State of Connecticut Veterans Home and Hospital. Nineteen showed partial paralysis and are not included in this study. Thirty-three patients had complete motor paralysis; in 3 cases no roentgenographic studies of the skeleton were available, thus, only 30 cases were studied. The paralysis of the upper extremities when present was never complete, while the paralysis of the lower limbs was total in all 30 cases. Tables 1 and 2 show the distribution according to etiology.

The post-traumatic cases top the list, making up almost 50% of the group with complete paralysis. Among the causes of injury, automobile accidents, diving accidents, and falls in construction work are predominant, in the order presented. Sixteen out of these 30 patients showed evidence of soft tissue calcifications. The distribution of calcifications was quite similar to that described in previous paper, though for some unknown reason no involvement of the knee joint region has been observed as yet. The appearance of these calcifications is quite striking and characteristic, as is illustrated by the roentgenograms (fig 1 and 2). The hip regions were involved in nine cases, the pelvis in three cases, and the thigh and adductor areas each in two cases. Four patients showed calcifications in more than one area. Some of the cases show a very minimal degree of calcification, however, the appearance and location of calcifications in these mild cases place them in the same group.

It has been very difficult to study the approximate date of appearance of these calcifications in these patients.

Most of them reached the hospital long after the start of motor paralysis. Thus, in 20 cases this time varied from 1 to 20 years, and in only 10 cases this period was below 1 year. Of these 10, calcifications were observed in 3 cases, urinary calculi, however, were present in 5 out of 10

Fig 1—Roentgenogram of white man aged 50 who had a compression fracture of the 10th thoracic vertebra there was dense irregular calcification lateral to hip joint and along greater trochanter

cases. Curiously enough one of the mildest cases was observed in a patient who had been paralyzed for 20 years. Table 3 shows the distribution according to etiology, in cases with soft tissue calcifications, calcifications

were observed in 57% of the post-traumatic lesions. In passing it may be of interest to see that in the same group, with complete paralysis, urinary calculi occurred in 19 out of 30 cases (63.3%).

I was interested, as others before me, in the role played by the level of the cord lesion. For that purpose, only the post-traumatic lesions with a definite spinal cord level were considered, 15 such cases were studied (14

fractures, 1 gun shot wound). It appears that lesions in the cervical region are more consistently accompanied by soft tissue calcifications.

In the 16 cases in which soft tissue calcifications were found, fractures of the skeletal parts below the lesion were seen in 4 patients (table 4). As was mentioned by Abramson and others, these fractures occur after minimal trauma or without apparent trauma. Because of the extreme osteoporosis so frequently present, they can be

not show any regression of these calcifications, and one year later the appearance was that of solid bone Recently this patient sustained a supracondylar fracture on the opposite side Interestingly enough, he showed similar, though less extensive, soft tissue changes (fig 4)

COMMENT

The soft tissue calcification in cord injuries can be differentiated from the much commoner post-traumatic myositis ossificans by the following factors 1 Myositis

ossificans develops after an injury At a certain time the calcification reaches its maximum, and from then on it has a gradually regressive course The differential diagnosis with neurotrophic arthropathies, known as Charcot's joints, is relatively easy, as the pathological bony process runs a parallel course to the disease itself, moreover in Charcot's joints there is increased bony density, while osteoporosis below the level of the transection of the cord is a constant and striking finding The terminology in the literature is rather confusing, since the same lesions have been given the name of paraosteoarthropathies (original name in Déjerine's paper), ossifying fibromyopathy, myositis ossificans, myositis ossi-

TABLE 4—Distribution According to Level in Post-Traumatic Cases

	No of Cases	No with Calcifications

Upper and mid dorsal	2	2
Lower dorsal	4	2
Lumbar	3	0
Total	16	10

ficans circumscripta neurotica, soft tissue calcification, and ossifications in cord lesions The two latter are the least confusing

The frequency of occurrence of these calcifications was found to be 48.7% by Déjerine¹ Of 48 patients studied by Abramson,³ 22 showed roentgenographic evidence of calcifications, Miller and O'Neill⁴ found only 12 such cases in a group of 289 patients I believe this

Fig 4—Roentgenogram of same patient as in figure 3 one year later dense calcification of right knee and thigh is in the same area as in previous figure In the left leg after a more recent supracondylar fracture a soft tissue calcification again simulating a subperiosteal hemorrhage is present.

low percentage is due to lack of routine x-ray studies of the skeleton rather than to the low incidence of such lesions, in the group of 30 cases of complete paraplegia,

4 Miller L F and O'Neill C J Myositis Ossificans in Paraplegics J Bone & Joint Surg 31 A: 283-294 (April) 1949

16 patients showed soft tissue calcifications, which represents 53.3%

The mechanism underlying the formation of these calcifications has been of great interest to many. Extensive studies of blood chemistry have been rather deceptive, as they did not reveal significant deviation from normal serum calcium, phosphorus, and phosphatase values. Such changes are characteristically lacking in true osteoporosis, or bone atrophy. Déjerine and her co-workers thought that, in addition to periosteal bone formation, metaplasia was probably the process by which the primitive connective tissue was able to generate bone in the soft supportive tissue.

Geldmacher⁵ thinks that tissue loses its character by trophic influence, reverting to an embryonic type. This embryonic tissue in the presence of hemorrhage, infection, and local increase in lime salts finds favorable conditions for the formation of such ossifications. This is suggestive of the opinion expressed by Déjerine. There is, however, a confusing discrepancy. The earlier pathological studies did not prove that either hemorrhage or infection precede the bone formation in these cases. But one cannot completely discard this view as far as excess bone formation around fracture sites in paraplegics is concerned.

The loss of bone density in motor paralysis is well known. The urinary output of calcium is found to be steadily increasing for a period of 30 days after injury, and it maintains a high level, probably as long as the function cannot be resumed (Abramson). The association of osteoporosis with soft tissue ossifications leads to the assumption that excessive calcium mobilization is one of the essential factors predisposing to ossifications,

but other factors must exist, since the ossifications occur only in paralyzed parts of the body. They are never seen in disuse bone atrophy, senile osteoporosis, or other types of osteoporosis. The interruption of pathways in the spinal cord sets the stage for these abnormal calcifications. In normal persons as much or more calcium is being laid down in the bone as is being removed from the bone, in paraplegics more calcium is removed than is being laid down, owing to deficient matrix formation.

The level of the injury may have an influence on the formation of calcification as is suggested in these cases, though of course the series is too small to arrive at any conclusion. In cervical cord lesions, calcifications were found in six out of seven cases, in two cases of upper dorsal cord injury calcifications were present in both cases. Calcifications were found in two out of four lower dorsal cord lesions, in three cases of lumbar cord injury no calcifications were demonstrated. One can only speculate as to the possible mechanism on the basis of these findings, the fact that the sympathetic is not involved in the low dorsal and lumbar injuries may be of significance.

SUMMARY

Thirty cases of complete paraplegia were studied, and soft tissue calcifications were found in 53.3%. Urinary calculi were present in 63.3% of the cases. The lesions of the cervical cord were, in this series, more consistently accompanied by soft tissue calcifications, this being the case in six out of seven cases, in cases of lower dorsal cord lesions calcifications were found in two out of four, in three cases of lumbar cord injury no calcifications were present. Further investigation of soft tissue calcifications is suggested.

TREATMENT OF RHEUMATOID ARTHRITIS WITH AUROTHIOGLYCANIDE (LAURON)

Robert C. Batterman, M.D., New York

The discovery of cortisone and corticotropin (ACTH) raised considerable hope that the therapy for the rheumatoid state was at hand. An evaluation of the results, however, particularly after prolonged use, is indicative that there is much to be desired. Although the initial improvement is excellent in all but a few patients, the overall effectiveness is disappointing. When the results are analyzed in terms of the therapeutic criteria of the American Rheumatism Association,¹ functional improvement is very good but the degree of improvement in terms of rheumatoid activity is usually grade 2 (major) or 3 (minor) and rarely grade 1 (complete remission). In view of the high relapse rate, severe withdrawal syndrome, and toxicity with prolonged use, Freyberg and associates² have recently indicated that they are concerned with the question "Will treatment with cortisone be worth while for this patient?" Therefore, the therapeutic measures available for the treatment of rheumatoid arthritis must be reevaluated, and those that over the years have been recognized to be the most effective should continue to be used. Prior to hormonal therapy,

gold preparations were considered to be of greatest value by all but a few investigators.³ The major criticisms raised against the use of gold therapy included (1) the slowness of onset of improvement, (2) the high incidence of patients not responding to initial treatment, (3) the low incidence of arrest of the rheumatoid process, and (4) the occurrence of toxicity, which might be serious in approximately 10% of the patients or fatal in approximately 0.5%. These criticisms are justified on the basis of knowledge available to that time, however, the history of any therapeutic agent or regimen reflects a fundamental principle that has been neglected for gold com-

pounds This principle holds that any therapeutic measure indicative of merit, regardless of the likelihood of toxicity, stimulates further research to obtain medicaments with greater effectiveness and decreased toxicity If a gold compound were to be developed with either one or both of these possibilities, the greater therapeutic range would extend the usefulness of gold therapy In such a case, the only valid criticism to gold therapy would be the slowness of onset of improvement The decreased toxicity would allow more extensive and prolonged treatment, thus decreasing the incidence of patients who previously did not respond and possibly increasing the number of patients that may have an arrest of the rheumatoid process

This report presents my experiences over an eight year period with a gold compound, aurothioglycanide⁴ (Lauron), which appears to decrease the criticisms of gold therapy During this period, the formulation of the therapeutic criteria in rheumatoid arthritis played an important role in selection of patients for this investigation The effectiveness of aurothioglycanide was analyzed according to these criteria I was a member of the committee delegated to formulate these criteria, and, therefore, I know that this study was conducted with strict adherence to objective control from the moment that therapy was begun until the final analysis of the result The patients selected for this investigation were chosen with particular care It was felt that a well-controlled, small group of cooperative patients representative of each stage of the disease was of greater value than a large series of patients The selected patients were observed for many months, and in some cases years, before gold therapy was begun The possibility of spontaneous remission was thereby minimized Furthermore, patients observed for such a period of time indicated their reliability for continued long-time study and follow-up

SCOPE OF INVESTIGATION

Sixty-nine patients received aurothioglycanide Thirteen of these patients had previously received another gold preparation, but only four of these patients did so under my supervision Eight of the group previously treated were unable to continue using the gold compound because of toxicity Aurothioglycanide was used in three dosage forms, 50, 100, and 150 mg of the compound suspended in sesame oil In a few of the early cases therapy was begun with an aqueous suspension The initial dose varied between 25 and 100 mg, depending on the patient's status of arthritis or experience with previous gold therapy If the disease was early and not too active, the initial dose was likehest to be 25 mg Also, if the patient had experienced toxicity previously to another gold compound, the initial dose for aurothioglycanide was 25 mg The majority of patients began therapy with 50 mg of the compound given intramuscularly at weekly intervals The initial dose was given for at least three weekly injections At the end of this period, if no improvement or toxicity occurred, the dosage was

increased to the next level, 50 mg in the case of the 25 mg initial dose, or 100 mg for the 50 mg dose This dose was then administered at weekly intervals If at the end of 8 to 10 weeks no improvement or toxicity occurred, the dose was again increased The status of the patient was thus reviewed at 8 to 10 week intervals and the dosage adjusted The maximum dose administered to any patient never exceeded 150 mg at weekly intervals The majority of patients received 100 mg as the maximum weekly dose If at the end of approximately six months no improvement occurred, the gold injections were discontinued In those patients who showed improvement during this period, the maximum weekly dose was continued until the improvement was well established and optimum for the patient's stage of arthritis At the end of this period, the patients were divided into two groups The first group of 25 patients had complete cessation of therapy, and they were observed at periodic intervals to note relapse or continuation of improvement If relapse occurred, a second course of therapy was begun utilizing the same system as the initial course Seven patients received an additional course with aurothioglycanide, and two patients subsequently received aurothioglucose

The second group of patients received a maintenance dose of aurothioglycanide, from 50 to 150 mg at two to four week intervals Seventeen patients received this form of therapy This was begun immediately after the initial therapy, which was terminated on an individual basis dependent on degree of improvement In other words, none of the patients received a fixed amount of gold for the initial treatment As soon as it was evident that improvement was sustained, the patient was transferred to a maintenance status, regardless of the amount of gold previously administered Thus, some patients began maintenance therapy within a few weeks of initial therapy, while others required several months of weekly injections before maintenance therapy was begun The dose usually used for maintenance was the maximum dose administered for the weekly injection

The total duration of therapy varied between five weeks and three years Approximately 75% of the patients received the preparation for more than 10 weeks, while approximately 50% of the patients were treated for 20 weeks or longer Twelve patients were treated without interruption for over one year This duration of therapy included the initial therapy as well as the period of maintenance of those patients receiving such therapy The total amount of the gold compound administered, including the amount for initial therapy as well as the amount for maintenance, varied between 200 and 7,100 mg Approximately 70% of the patients received more than 1,000 mg Twenty-one per cent of the patients received more than 3,000 mg Six patients received more than 5,000 mg It is of interest to note that approximately 55% of the patients received 1,000 mg or more for the initial therapy Nine patients received more than 3,000 mg, and one of these was given 4,725 mg In addition to the initial therapy, 17 patients received maintenance doses totaling between 425 and 5,700 mg Seven of these patients received a total of more than 3,000 mg of the preparation for maintenance

⁴ Aurothioglycanide contains 54% gold with the gold linked by means of a sulfur bridge to the organic portion of the molecule The compound is available in sesame oil suspension in a multiple dose vial with a concentration of 50 mg and 150 mg per cubic centimeter Endo Products Inc New York supplied the material and other aid for this investigation

RESULTS

Initial Therapy—In regard to improvement in terms of rheumatoid activity, the patients were analyzed according to the therapeutic criteria¹ adopted by the American Rheumatism Association. The results should be considered as preliminary in nature, since insufficient time has elapsed to evaluate the question of recurrences or arrest of the rheumatoid process. At the termination of the weekly injections of the gold compound, 8 (11.6%) of the 69 patients manifested grade 1 (complete remission) improvement and 18 (26%) patients presented grade 2 (major) improvement. The other patients had either insignificant improvement or no effect on the rheumatoid activity. Thus, 37.7% of the patients had significant improvement. This analysis included all patients regardless of the stage of their disease or whether gold therapy was discontinued owing to toxicity. It is felt that in the latter cases patients should be included as a "no response," since therapy was not effectual. When one considers the response in terms of the stage of arthritis existing prior to therapy, it is apparent that a greater likelihood of improvement can be expected if the disease is treated early. Thus, of the eight patients with early, or stage 1, arthritis, four (50%) had complete remission and an additional two patients had major improvement, giving an over-all effectiveness of 75%. There were 17 patients with stage 2 arthritis, of these 4 (23.5%) had complete remission and 4 (23.5%) had major improvement, giving an effectiveness of 47%. With stage 3 and 4, none of the patients had complete remission. Nine (41%) of the 22 patients in stage 3 had major improvement, while only 3 (13.7%) of the 22 patients in stage 4 presented major improvement.

Maintenance Therapy—The 17 patients treated with maintenance doses are of particular interest. These patients had an initial response and therefore continued therapy. Fifteen (88%) of these patients had a satisfactory end-result, with nine (41%) patients having a complete remission and eight (47%) patients having major improvement at the termination of maintenance. The two patients who failed to respond manifested increasing rheumatoid activity in spite of initial improvement and maintenance doses. Although there are too few cases for accurate statistical analysis, it is the impression that if the patient has stage 1 or 2 arthritis, the likelihood of achieving a good therapeutic response to therapy is excellent if the patient is able to tolerate the preparation and if therapy is continued as a maintenance procedure.

Improvement of Functional Capacity—Improvement in terms of functional capacity is best considered in regard to the patient's original functional capacity. Thus, of the 17 patients in group 2, 8, or 47%, had complete restoration of function. Of the 27 patients in group 3, 5 (19%) had complete restoration and 12 (44%) improved into group 2. Of the 24 patients originally in group 4, functional improvement to group 2 occurred in 8 (33%) and to group 3 in 6 (25%). In general, improvement in functional capacity occurred in 41 (approximately 60%) of the 69 patients. All the patients on maintenance doses showed improvement in functional capacity. It is apparent that functional improvement is likelier to occur in patients treated with gold therapy than is reduction or abolition of rheumatoid activity.

Toxicity—In analyzing the type and incidence of toxicity to aurothioglycanide, it is best to consider first those patients who had no toxicity to gold compounds used previously. Thus, 61 patients of the original group of 69 patients met this criterion. Toxicity of any degree or type was noted during the initial therapy in 15 of these patients, or 24.6%. The toxicity took the form of pruritis alone in three patients, an erythematous rash and pruritis in nine patients, an associated metallic taste in one patient, nausea and vomiting in one patient, and dermatitis exfoliata in two patients. One patient, with a mild rash, also noted edema of the face, leukopenia was discovered on blood cell count examination. In retrospect, the two patients with dermatitis exfoliata should not have had this severe reaction, since in both cases pruritis was noted prior to the rash, however, both cases were studied in the early period of knowledge of the drug.

The time of occurrence of the toxic manifestations reflect the relative safety of the preparation. Only six patients presented toxic symptoms or signs within 10 weeks of therapy. The earliest was five weeks after administration of 300 mg of the drug. The longest period was for the patient in whom dermatitis exfoliata developed after 43 weeks of continuous therapy, or administration of 4,725 mg of the drug. The others ranged from 11 to 28 weeks, with a dosage range of 400 to 2,350 mg. In addition to these 15 patients, toxic manifestations developed in 2 while on maintenance therapy. In one patient, after a total of 38 weeks of therapy, 2,200 mg, pruritis and a metallic taste developed. In the other patient an erythematous rash and metallic taste developed after 137 weeks of therapy, equivalent to 4,000 mg. In two additional patients toxic manifestations developed when a second course of the gold compound was administered. This occurred after 14 and 20 weeks, of 1,100 and 2,075 mg, respectively, administered in the second course. Thus, 19 out of 61 patients, or 31%, not having any previous toxicity to gold compounds, manifested toxicity to aurothioglycanide. The incidence may have been higher if more patients continued their initial therapy or received maintenance doses, however, this problem arises in any group of patients so studied, and it may be concluded that for the usual group of clinic and hospital patients treated with aurothioglycanide the incidence of toxicity is approximately 30%.

The duration of toxicity for the minor signs such as pruritis alone or mild erythematous eruption and pruritis was, as a rule, brief and never exceeded eight weeks. The majority of patients had complete subsidence of their complaints within two weeks of stopping gold therapy. In many cases, the toxic manifestations were transitory, being noted at one clinic visit and not being present at the next visit one week later. The only severe manifestation of dermatitis exfoliata existed for one year in one case and is still present for a period of more than two years in another. There was no correlation of the occurrence of toxicity with the age of the patient, stage of the disease, duration of arthritis, sex, race, or weekly dose. There was some indication that the duration of therapy may be a factor. Excluding the two patients in whom toxicity developed with maintenance doses, it was unusual to see toxicity after 15 weeks of continuous treat-

ment Thus, in 73% of the patients in whom toxicity developed it did so before 15 weeks of therapy

In the group of 69 patients treated with aurothioglycanide, there were 13 patients who had previously received another gold preparation In eight of these patients toxicity had developed previously When subsequently treated with aurothioglycanide toxicity occurred in five of these eight patients, however, in only one case was this toxicity severe In this patient dermatitis exfoliata developed after 35 weekly injections of a total of 3,800 mg The other patients noted mild pruritis and an erythematous rash, which lasted from one to eight weeks In two patients this toxicity developed after four and five weeks of 150 and 300 mg of gold The other two required 12 and 34 weeks, or 1,000 and 2,550 mg, respectively It is of interest to note that three of these eight patients could tolerate large doses of the gold compound without toxicity An additional patient received an oily suspension of aurothioglucose (Solganal B oleosum) subsequent to aurothioglycanide, and toxicity developed to the former but not to aurothioglycanide Thus four out of nine patients receiving both preparations could tolerate aurothioglycanide but not aurothioglucose

Aurothioglucose—Through the cooperation of Dr Joseph Bunim, chief of the arthritis services, Third Medical Division (New York University), Bellevue Hospital, it was possible to obtain the records of a group of rheumatoid patients treated with aurothioglucose These patients, in addition to those patients treated with this gold compound under my supervision, comprised a total group of 44 patients Since the majority of these patients were observed by other physicians, a comparative control of the degree of improvement is not possible, and this aspect of treatment of this group will therefore not be presented The data are pertinent only for the toxic manifestations The 44 patients were treated according to a method similar to that in the aurothioglycanide group, except that maintenance doses were not given The initial dose, as a rule, was 10 mg given intramuscularly and at weekly intervals This was increased until the patient was receiving 50 mg as a maximum dose The duration of treatment varied between 2 weeks, for two patients in whom toxicity developed within this period, and 76 weeks The majority of patients were treated for 12 to 24 weeks The total amount of aurothioglucose administered varied between 20 mg (for the two patients in whom immediate toxicity developed) and 3,090 mg Approximately 50% of the patients received 900 mg or more

Toxic manifestations were noted in 24 of these 44 patients, or an incidence of 54.5% This occurred in from 2 weeks to 27 weeks of continuous therapy As in the case of aurothioglycanide, in the majority, or 66%, of the patients in whom toxicity developed it did so before the 15th week of therapy, however, unlike this preparation, it did so before the 5th week in four patients The amount of aurothioglucose administered at the time of toxicity varied from as little as 20 mg to as much as 1,365 mg In approximately 58% of the patients toxicity developed before 500 mg of the drug was given A comparative incidence for aurothioglycanide occurred at the 1,000 mg mark

The type of toxicity was also severer with 19 out of the 24 patients manifesting an erythematous eruption Three patients manifested ulcerative stomatitis or buccal lesions One patient had a severe anemia, and another purpuric manifestations Another patient presented albuminuria The duration of toxicity was also greater than that seen with aurothioglycanide Although several patients had transitory signs, many patients had continuation of the eruption for several weeks and months

COMMENT

The treatment of rheumatoid arthritis with gold compounds requires the application of fundamental principles universal for all forms of therapy The first consideration is the disease itself It is a progressive disorder that manifests itself by exudative phenomena of articular and extra-articular structures The resultant pain, functional disability, joint destruction, and deformities challenge the efficacy of any therapeutic measure The problem is twofold The most important factor is to utilize "specific" agents to decrease, abolish, and prevent recurrences of the rheumatoid process or activity Concomitant with specific medications, analgesics, sedatives, supportives, physical therapy, and orthopedic procedures as palliative and corrective measures could be utilized

In regard to specific therapy, the efficacy of gold preparations has been the subject of considerable controversy It would appear that the exudative process as a manifestation of rheumatoid activity may be decreased or abolished in many patients by the use of gold compounds, however, past experience with gold compounds has disclosed several facts pertaining to their use that require careful analysis First, improvement in the rheumatoid process is slow to occur Several weeks and occasionally months of continuous treatment are necessary before any significant improvement is manifested by the patient This latent period is specific for the individual patient The length of time required for its occurrence cannot be predicted in advance, nor can it be shortened by more frequent injections On the contrary, the latter practice usually increases the likelihood of toxicity From the patient's point of view, this latent period is most discouraging, since pain and disability are unchanged From the physician's or investigator's point of view, the slow improvement cannot be distinguished from the natural remission that may occur The results in any particular patient are therefore open to question, however, a statistical analysis of groups of rheumatoid patients is indicative that natural remission is not frequent and that with gold compounds this slow improvement is noted in the majority of patients

Second, the degree of improvement is dependent on the stage of the disease Gold therapy is most effective in the early phases before extensive joint destruction, deformities, and contractures are manifest This lack of response to therapy for the advanced patient should be given due consideration in the final analysis of any treatment for any chronic disease Lumping of results with inclusion of all stages of the disease is often misleading and the value of the therapy hidden by statistical implications In the present study, approximately 60% of the patients were in stage 3 or 4 of their arthritis The results, therefore, do not appear significant because the majority

of patients did not manifest grade 1 or 2 improvement, however, the results in the early stages of the disease leave no doubt that gold compounds are effective. It is claimed that the over-all effectiveness is no greater than what one would expect in a group of patients untreated for 10 years. What is not clarified is that these untreated patients may, at the end of 10 years, be free of the rheumatoid activity but at the expense of a crippling, deformed, usually bedridden state, whereas the treated group will have an arrest or major improvement of their disease relatively early in the treatment period so that further progression to the irreversible, crippled state is prevented.

One of the major criticisms raised against gold therapy is that with its cessation the majority of the patients will have a recurrence of the rheumatoid process. This observation was based on the results of the treatment of patients by courses of the drug. Recurrences have been eliminated by continuing therapy with maintenance doses. Not only the initial improvement will be sustained but also the likelihood of flare-ups of the rheumatoid activity occurring during and after therapy will be diminished.

The question of attaining a cure rather than an arrest of the rheumatoid process with gold compounds has still to be decided. The previous use of gold preparations by means of courses was unsatisfactory in this regard, but by continuous maintenance doses it may be possible to attain a cure in those patients in the early stages of their disease. This phase of treatment is still under investigation, but the results are more encouraging than heretofore. Once improvement is well established and maintained, it is exceedingly rare for such a patient to manifest progression of his disease.

The degree of improvement attained with maintenance therapy is dependent on the stage of the disease, degree of rheumatoid activity, response during initial phase of treatment, and posology in the use of the gold compound. Experience with aurothioglycanide is indicative that with rare exception if the patient responds during the initial period of treatment this response will be progressive and sustained. The likelihood of its occurrence is greatest if the patient has stage 1 or 2 arthritis. The maintenance dose may have to be adjusted on an individual basis dependent on the completeness of response. Adjustment may be necessary in the size of the dose as well as intervals between injections. With stage 3 or 4 arthritis, the over-all response may be incomplete in that the patient continues to present exudative swelling, pain, and disability. It must be recognized that this response may be maximum for that patient and that complete remission cannot be attained, however, with maintenance doses it is possible to sustain the degree of improvement that has been achieved and thus in many instances keep the patient in a more comfortable state.

The toxicity of gold compounds has been the major disadvantage to their use. There is no question that the toxicity may be serious and even fatal, but it must be kept in mind that the reluctance of the medical profession to use gold preparations is based on the early formative years in their investigation. Not only were the original gold preparations more toxic than those avail-

able today but also insufficient knowledge was available to guide the physician in prophylactic measures or recognition of the early signs of toxicity that were not serious unless therapy was continued in spite of their presence. These two factors resulted in a very high incidence of serious toxicity in the early investigations. The more recent use of gold preparations has been relatively free of severe toxic manifestations except in the rare patient with an idiosyncrasy. Recognition of early signs, such as pruritis, any rash, metallic taste, or albuminuria, and discontinuation of therapy immediately with their occurrence has proved most satisfactory in avoiding serious toxicity. As a rule, therapy can be continued in many patients on this subsidence, but with the use of smaller doses.

Aurothioglycanide, in my experience, possesses the lowest potentiality for producing toxicity of any available gold preparations. This does not mean that toxicity cannot occur with its use. On the contrary, the same precautions are necessary in its use as with other gold compounds, however, the likelihood of serious toxicity is much less, and patients who cannot tolerate other gold compounds may continue therapy with aurothioglycanide. The question arises whether the insolubility of this gold preparation contributes to the lessened toxicity. It is conceivable that the intramuscular deposition of an insoluble gold compound might be less toxic because of delayed or lessened absorption, however, although absorption may not be complete, it does occur. The clinical response occurs at a time experience has taught us to expect with the use of soluble gold compounds. Furthermore, the occurrence of toxicity to this gold compound is itself evidence of absorption.

Many of the toxic manifestations seen with gold therapy may be the result of an idiosyncrasy rather than an actual cumulative gold intoxication. This is proved by the following factors: 1. Patients who manifest toxicity do so relatively early during the initial treatment period. Toxicity is most frequent before the 15th week of treatment and is uncommon thereafter. 2. It is unusual for the patient to present toxicity during the maintenance phase of therapy. 3. Patients previously treated with gold compounds who require additional therapy must begin cautiously with smaller than usual doses because of an increased likelihood of toxicity.

It is my belief that aurothioglycanide is not as toxic as other gold compounds because sensitization to its entire chemical moiety is less likely to develop. The lower incidence of toxicity with this gold preparation has thus increased the therapeutic range of this particular compound. It is for this reason that therapy could be continued for longer periods of time and achieve, if possible, a therapeutic result with prolonged therapy. The results with maintenance doses have been very satisfactory. The likelihood of attaining complete remission or arrest of the stage 1 or 2 rheumatic arthritis is now excellent as long as treatment in courses is avoided and maintained therapy instituted as soon as improvement is manifest.

CONCLUSIONS AND SUMMARY

The effectiveness and toxicity of aurothioglycanide were studied in a selected group of 69 patients with rheumatoid arthritis. Twenty-six patients (37.7%),

regardless of their stage of the disease, had a significant improvement with the initial phase of therapy. This, however, is misleading, since patients with advanced disease are less capable of response. Fifty-six per cent of the patients with early (stage 1 or 2) arthritis showed complete remission or major improvement at the termination of initial therapy. The initial response was further enhanced by maintenance therapy with aurothioglycanide, since 15 out of 17 (88%) patients so treated had a satisfactory end-result. Maintenance after initial im-

provement is the recommended method for gold therapy, since the likelihood of attaining complete remission or major improvement is excellent. The incidence, type, severity, and duration of toxic manifestations are indicative that aurothioglycanide is less toxic than other available gold preparations. The greater therapeutic range of aurothioglycanide removes, to a great extent, the major criticism against gold therapy, leaving the slowness of improvement as the only valid objection.

PRELEUKEMIC ACUTE HUMAN LEUKEMIA

Matthew Block, M D, Ph D, Leon O Jacobson, M D

and

William F Bethard, M D, Chicago

During the past three years we have had the unusual opportunity to observe 12 patients for as long as 27 months prior to the development of acute myelogenous or stem cell leukemia. During the preleukemic phase, the transitional phase to acute leukemia, as well as thereafter until death, their clinical courses were recorded, frequent complete peripheral blood cell counts were made, and serial biopsies of the bone marrow and, in some cases, biopsies of liver and spleen were obtained.

Interest in the preleukemic phase of human acute leukemia has been heightened by recent studies in induced mouse leukemia. In both humans¹ and mice, the disease is usually rapidly fatal, with only short remissions sometimes produced by steroid or antifolate acid therapy. In the mouse, however, treatment with cortisone in the preleukemic phase of the disease has been shown to decrease the incidence of leukemia induced by x-ray² and possibly that induced by methylcholanthrene.³

This study is presented because it concerns the preleukemic phase of human acute leukemia, knowledge of which is at best fragmentary, and because studies on mouse leukemia have pointed to the possibility of a therapeutic approach to what is still a rapidly and uniformly fatal disease. This paper emphasizes the clinical course of various patients. In a companion publication, emphasis will be placed on the histogenesis of human acute leukemia.

It was sometimes difficult to determine the exact time at which a particular patient might be classified as being leukemic. One might object to a concept that differentiates a preleukemic from a leukemic phase in a patient who dies of leukemia on the grounds that the patient

should be considered as having leukemia from the onset of symptoms clearly related to his final illness. As already mentioned, the recent studies on mouse leukemia point to a possible difference between what we choose to call the preleukemic and the leukemic phase.⁴ Furthermore, there are clinical grounds on which this differentiation may be made. In the preleukemic phase, the characteristic enlargement of any of the hematopoietic tissues, except in two patients, was not demonstrable. In our experience, as well as in that of others, one may encounter middle-aged women with neutropenia,⁵ other patients with refractory anemia⁶ or thrombopenia,⁷ and even those with large numbers of immature cells (including stem cells) in the peripheral blood,⁸ in whom leukemia does not develop but who recover from or die of some other disease. Herz's patient^{8a} had a white blood cell count of 24,000, with 55% stem cells, but leukemia did not develop. In addition, the histopathology of the bone marrow, liver, and spleen seen in our patients in the preleukemic phase is similar to that described in other conditions, namely neutropenia, purpura, and refractory anemia.⁹

Consequently, the diagnosis of acute myelogenous, or stem cell, leukemia has been made only at the time that the patients presented most of the classic criteria of acute leukemia, special attention being paid to the peripheral blood and especially to the hematopoietic tissues.

The presence of lymphadenopathy of even a slight degree, especially if combined with splenomegaly and hepatomegaly, has been considered important in making a diagnosis but, as will be seen, occurred quite late in the course of the disease. The demonstration of immature cells is of utmost importance but, as has already been shown, is far from pathognomonic of leukemia. Replacement of normal bone marrow elements by sheets of stem cells and promyelocytes has been the most important criterion selected to make a diagnosis of acute leukemia, since, even in the most intense leukemoid reaction, fairly large amounts of erythroblasts, megakaryocytes, and fat may be demonstrated. Similarly, a diagnosis may be made if foci of stem cells and early granulocytes are demonstrable in specimens of the liver and spleen.

Delivered at a joint meeting of the American Association for Cancer Research and the American Association of Pathologists, April 13, 1952, New York.

The study reported in this paper was supported in part by the National Cancer Institute, United States Public Health Service, and the Armour Laboratories and by an institutional grant from the American Cancer Society.

Dr Arvid Johnston and Dr A. R. K. Matthew of Rockford, Ill., aided in the follow-up studies of the patient in case 1 and Dr Charles A. McClelland of Paris, Ill., in the follow-up studies of the patient in case 7. Dr Cecil A. Warren of St. Paul, Minn., supplied the clinical records in case 10.

MATERIAL

Table 1 shows certain characteristics common to the 12 patients that were the basis for this study. All 12 were in the older age group, and 9 were postmenopausal women, the 10th woman had begun to complain of hot flushes. Various allergies were noted by six women. Each patient had as a major complaint at onset some symptom referable to a deficiency of bone marrow function, such as weakness and fatigue, infection, and a hemorrhagic phenomenon, singly or in combination. In all of the cases, except four in which the date of diagnosis of leukemia could not be set accurately and one (case 10) in which the diagnosis is still in doubt, the preleukemic phase was at least three times longer than the leukemic phase. Except for two cases and case 5, in which the leukemic phase lasted nine months, the patients' courses were extremely acute, almost explosive, once the leukemic phase became manifest.

Numerous biochemical determinations were obtained during the preleukemic phase, but, for the most part, they were normal or reflected temporary disturbances in fluid balance. Many of the patients had subclinical

a few petechiae on the legs, and a liver palpable 2 cm below the costal margin. Hemoglobin level was 4.3 gm per 100 cc, platelets, 96,000 per cubic millimeter, reticulocytes, 1%, and white blood cells, 1,900 per cubic millimeter, with 78 neutrophils, 20 small lymphocytes, and 2 monocytes. Six erythroblasts per 100 white blood cells were present in the smear. Bleeding time was 4 minutes 30 seconds and clotting time 18 minutes. Sections of a bone marrow needle biopsy revealed a densely erythroblastic marrow with maturation arrest and marked decrease in the number of granulocyte precursors and neutrophils. A biopsy of the liver was normal except for a slight increase in iron in parenchyma cells. The patient was discharged with a diagnosis of primary refractory or acquired hemolytic anemia on Aug 17, 1949, 10 months prior to her death and 6 months prior to the time a diagnosis of leukemia was made.

The progressive anemia was treated by blood transfusions. Two months prior to development of a leukemic state, the white blood cell count was 2,500, and occasional stem cells (myeloblasts and monocytoblasts) began to appear in the peripheral blood. The diagnosis of acute leukemia was made in February, 1950, about four months prior to death. The liver and spleen were still not palpable, and the lymph nodes were not enlarged, but a marked hemorrhagic diathesis and pharyngitis had developed. X-ray therapy was given but did not change the course of the disease.

By May, 1950, the white blood cell count reached 35,000 and then 50,000 per cubic millimeter, with many myeloblasts

TABLE 1—Clinical Data on Twelve Patients

Patient	Age	Sex	Years Post menopause	Allergic History	Onset	Duration of Disease (Mo)		
						Total	Preleukemic	Leukemic
1	50	F	2		Anemia	21	17	4

jaundice, but the jaundice was not a typical hemolytic type, with elevation of the indirect bilirubin. The patients in whom fecal urobilinogen determinations were obtained usually had an elevated hemolytic index even during periods when they were not jaundiced. The protein and albumin-globulin ratio was either normal or showed only a borderline elevation of the globulin and depression of the albumin.

REPORT OF CASES

CASE 1—This 56-year-old widowed housewife was well until the development of diabetes in 1943. In July, 1948, she had a normal white blood cell count and hemoglobin level. In October, 1948, 17 months before a diagnosis of leukemia was made and 21 months before her death, an initial low hemoglobin level of 11.6 gm per 100 cc was found. By November 1948, the hemoglobin level had dropped to 10.4 gm, but the white blood cell and differential counts were still normal. In February, 1949, she first began to complain of fatigue and vague abdominal pains. After that, progressive neutropenia and anemia developed, and the woman lost 15 lb (6.8 kg). She was admitted to the hospital on Aug 2, 1949. There had been no known exposure to toxic agents. Physical examination on admission revealed nothing but mild diabetic retinopathy,

and myelocytes. This was one month before death. Hepatomegaly, splenomegaly, generalized purpura, and nodular skin infiltrations developed. Shortly prior to the patient's death on June 6, 1950, the hemoglobin level was 8 gm per 100 cc, platelets 27,000, and the leukocyte count, 208,000 per cubic millimeter, consisting only of stem cells and promyelocytes. At autopsy, the gross abnormalities were generalized purpura and subcutaneous nodules. The liver weighed 850 gm, the spleen weighed 750 gm, and numerous nodes 0.5 to 0.8 cm in diameter were found. On microscopic examination, infiltration of the bone marrow, spleen, heart, lymph nodes, skin nodules, kidney, and adrenals by large stem cells was found.

CASE 2—A 62-year-old housewife had had a vesicular skin rash for 20 years. In 1943 a duodenal ulcer developed. From 1948 until July, 1950, sporadic red and white blood cell counts, hemoglobin determinations, and differential counts were normal. At that time, 17½ months prior to the diagnosis of acute leukemia and 19 months prior to death, the hemoglobin level was 12.7 gm and the red blood cell count was 3,800,000. Physical examination revealed nothing abnormal. By April 1951, the hemoglobin level had dropped to 11.9 gm per 100 cc, the red blood cell count to 3,500,000, and the white blood cell count to 5,600 per cubic millimeter. From this time on there was progressive weakness. On Aug. 30, 1950, the hemoglobin level was 8.7 gm and the red blood

cell count was 2,800,000, in spite of repeated transfusions. The white blood cell count was 2,250 per cubic millimeter, with a normal differential count, and there were 159,000 platelets and 7.4% reticulocytes. A bone marrow biopsy showed a marrow at the upper limit of normal cellularity (40% fat). The marrow was primarily erythroblastic, with many erythroblasts in mitosis, and there was maturation arrest of the granulocytes so that only rarely were any adult neutrophils seen. Stem cells were slightly but significantly more numerous than normal. Iron granulation was excessive. In view of the patient's claim that she had been jaundiced, a diagnosis of acquired hemolytic anemia was considered. Because of neutropenia and bone marrow findings, toxic agranulocytosis was also considered.

Anemia continued intractable, malaise and anorexia developed, and, in November, 1951, marked purpura was first noted. On physical examination there was no lymphadenopathy, hepatomegaly, or splenomegaly, but a single ecchymosis was found. Smears of a bone marrow aspiration on Nov. 5, 1951, were extremely cellular and were composed of over 50% stem cells. The hemoglobin level was 9.9 gm (after transfusions), platelets, 57,000, reticulocytes, 0.3%, and there was leukopenia, 2,500 white blood cells, with a differential count of 2 neutrophils, 66 small lymphocytes, 1 monocyte, 26 myeloblasts, 1 myelocyte, 4 metamyelocytes, and 1 erythroblast. Since the diagnosis of acute leukemia was unequivocal, administration of corticotropin (ACTH) was begun on Nov. 20, 1951, but had to be stopped because of a psychosis. Thereafter, in spite of intermittent cortisone therapy, the hemorrhagic tendency became worse, fever continued at 40°C, and anemia was not alleviated by transfusions. Jaundice, extreme purpura, and shotty lymphadenopathy developed, but there was no splenomegaly or hepatomegaly. The patient died on Dec. 10, 1951, one and one half months after the diagnosis had been made and 19 months after the start of the preleukemic phase. Permission for autopsy was refused.

CASE 3—The patient was in good health until generalized pains and nervousness developed in December, 1948. In April, 1949, the woman was treated for amebiasis and all through 1949 received a wide variety of medicaments for mild joint and abdominal pains. In September, 1949, an erythematous rash developed on her shoulders and legs. She had lost 50 lb (22.7 kg) by the time she was first seen on Jan. 16, 1950, seven and one half months prior to the diagnosis of acute leukemia and eight months prior to death.

Physical examination at that time revealed nothing except a few petechiae and ecchymoses and positive evidence of the Rumpel-Leede phenomenon. Hemoglobin level was 13.5 gm per 100 cc, red blood cell count, 4,100,000, platelets, 195,800, reticulocytes, 1.4%, and white blood cell count, 900 per cubic millimeter, with a differential count of 21 neutrophils, 2 eosinophils, 71 small lymphocytes, and 6 monocytes. At the end of January, 1950, acute thyroiditis developed with a rise in the white blood cell count to 2,400, with only 14 neutrophils, 81 small lymphocytes, 2 eosinophils, 3 monocytes, and 5 erythroblasts. The hemoglobin level was 13 gm, platelets, 201,000, and reticulocytes 2.2%. Bone marrow on Feb. 8, 1950, showed hyperplasia of granulocyte precursors but a normal number of erythroblasts and megakaryocytes. An epinephrine test was performed, and the leukocyte count rose from 1,800 to 5,000 per cubic millimeter, the platelets were unchanged after 30 minutes. Diagnosis of bromidism, acute thyroiditis, and hypersplenism was made. Toxic neutropenia and early acute leukemia were considered improbable.

Between February and the beginning of August, 1950, three blood cell counts showed no significant change. The patient continued to feel well. During the first week of August, gingivitis stomatitis, and pharyngitis developed. Physical examination revealed only ulcerative pharyngitis and petechiae and ecchymoses on the woman's legs. Hemoglobin level was 9 gm, red blood cell count, 3,200,000, platelets, 77,000, reticulocytes, 1.1%, and white blood cell count, 1,250, with a differential count of 1 neutrophil, 1 eosinophil, 80 small lymphocytes, and 18 myelocytes. On Aug. 23, 1950, the bone marrow had a normal number of erythroblasts, stem cells were increased, and there was maturation arrest and hyperplasia of granulo-

cyte precursors. The patient was treated with aureomycin, but right lower lobe pneumonitis developed. Hypersplenism was still thought to be the most logical diagnosis.

On Sept. 1, 1950, surgical biopsy of the sternum was obtained. The marrow was almost solidly cellular. There were solid sheets of stem cells, with occasional promyelocytes, neutrophils were extremely rare, erythroblasts were moderately decreased, and megakaryocytes were numerous. The spleen was first palpated on that day.

Because of increasing toxicity, purpura, and pneumonitis the patient underwent an emergency splenectomy on Sept. 3, 1950, 13 days before death, with a diagnosis of hypersplenism, although early acute leukemia was considered. Sections of the spleen showed hyperplasia of lymphatic nodules composed of medium to large lymphocytes. Occasional stem cells were seen in the red pulp. A biopsy of the liver revealed an increase in the number of large and small lymphocytes in the portal areas.

On Sept. 5, 1950, the hemoglobin level was 14.4 gm (after massive transfusions), red blood cell count, 5,000,000, platelets, 86,900, and white blood cell count, 1,640 per cubic millimeter, with a differential count of 1 neutrophil, 1 eosinophil, 10 small lymphocytes, 83 myeloblasts, 5 promyelocytes, and 89 erythroblasts. Giant platelets were seen. The leukocyte count rose to 6,500 per cubic millimeter but consisted almost solely of stem cells and promyelocytes and only occasional erythroblasts. Marked purpura and increasing jaundice developed, and the patient died on Sept. 16, 1950, in spite of treatment with corticotropin and cortisone.

The gross findings at autopsy were marked jaundice, generalized hemorrhages, and decubitus ulcers. The liver weighed 2,200 gm, but there was no significant lymphadenopathy. The marrow was extremely cellular and contained sheets of myeloblasts and promyelocytes, with occasional erythroblasts and adequate megakaryocytes. Microscopically, the liver was similar to the specimen obtained at operation. No other evidence of leukemia was noted.

CASE 4—This 46-year-old woman first noted menorrhagia and metrorrhagia in January, 1949, 30 months before she died and 10 to 26 months before we made the diagnosis of acute leukemia. Generalized purpura developed in September, 1949, and a diagnosis of thrombocytopenic purpura was considered. Findings on physical examination in October, 1949, were normal except for pallor, ecchymoses, and purpura, but the Rumpel-Leede phenomenon was absent. Blood cell studies indicated 8.3 gm of hemoglobin, 3,300,000 red blood cells, and 11,300 white blood cells, with a differential count of 41 neutrophils, 34 small lymphocytes, 16 myeloblasts, 4 myelocytes, and 5 metamyelocytes. Sections of bone marrow aspirated on Oct. 20, 1949, revealed a solidly cellular marrow, with extreme hyperplasia of the granulocytic and erythroblastic lineages but only slight maturation arrest in the former. Stem cells and mitotic cells were not numerous. No diagnosis was made. Although subacute myelogenous leukemia and hypersplenism were considered, it was felt that the erythroblastic hyperplasia was too intense to warrant the former diagnosis. Splenectomy was seriously considered.

X-ray sterilization was completed in November, 1949, because of uncontrollable vaginal hemorrhage. At that time, the platelet count was 133,000 per cubic millimeter. The presence of 8.7% reticulocytes and 5 erythroblasts was thought to contradict the diagnosis of acute or subacute leukemia. The only new finding was swollen submaxillary glands probably related to hemorrhagic gingivitis. Because of the latter, the patient received x-ray therapy to the gums in January and February, 1950, with only negligible benefit.

She continued to experience frequent hemorrhages, and, on Jan. 6, 1950, another marrow specimen was similar to the first, but 10 days later a specimen contained fewer erythroblasts. Findings on physical examination were normal except for an extreme generalized hemorrhagic tendency. Bleeding and an intermittent fever continued in spite of antibiotics, toluidine blue and local absorbable gelatin sponge (Gelfoam). The hemoglobin level was 7.9 gm per 100 cc, and red blood cell count was 2,700,000 in spite of repeated transfusions. There were 81,120 platelets, and the white blood cell count had risen to 14,000 per cubic millimeter, with 50 neutrophils,

6 medium lymphocytes, 30 small lymphocytes, 1 eosinophil, 5 myeloblasts, 4 myelocytes, 4 metamyelocytes, and 5 erythroblasts

The marrow on Feb 14, 1950, was still solidly cellular but contained more adult neutrophils and showed at least adequate erythropoiesis and megakaryocytopoiesis. The white blood cell count was 25,300, with 37 neutrophils, 9 lymphocytes, and 16 stem cells, 4 promyelocytes, 18 myelocytes, 14 metamyelocytes, 2 stab cells, and 5 erythroblasts. There were 55,000 platelets per cubic millimeter. The diagnosis of subacute myelogenous leukemia was considered seriously but not accepted because of the marked erythropoietic activity of the marrow as well as the complete lack of lymphadenopathy, splenomegaly, or hepatomegaly.

In March, 1950, extraction of all of the patient's teeth resulted in extreme hemorrhage and gingival hyperplasia. Repeated blood cell counts were unchanged. In April, 1950, 17 months prior to death, the gingival hyperplasia was so extreme that it was felt that subacute myelogenous leukemia was the most likely diagnosis. The gingival hyperplasia responded dramatically to administration of corticotropin, and there was some improvement in the hemorrhagic tendency.

The patient's course was marked by exacerbation and remission of the hemorrhagic diathesis, with partial control by steroidal therapy and a white blood cell count that varied from 3,000 to 50,000 per cubic millimeter, with as many as 16 erythroblasts in the peripheral blood. Minimal and questionably significant lymphadenopathy was first detected in November, 1950, 10 months before death. Definite abnormalities, such as lymphadenopathy, hepatomegaly, and splenomegaly, were first noted in May, 1951, only four months before the woman died. A bone marrow biopsy specimen obtained at that time was inadvertently lost.

The patient died on Sept 9, 1951. Postmortem examination was limited to needle biopsy of the liver, spleen, and bone marrow and to excision of a supraclavicular node. All specimens showed marked infiltration with many stem cells and some promyelocytes. Rarely, a few erythroblasts and megakaryocytes were found in the marrow. The marrow was completely unlike that obtained at the previous biopsy on Feb 14, 1950, when the diagnosis of subacute myelogenous leukemia was rejected primarily because of the marrow histopathology.

Because of the lack of tissue studies, it is hard to fix the date of development of an unequivocal leukemic state, but this probably occurred between February, 1950, 20 months prior to death when there was a white blood cell count of 25,000 per cubic millimeter, with 52% immature cells and 55,000 platelets, and May, 1951, 4 months before death, when lymphadenopathy, splenomegaly, and hepatomegaly were noted.

CASE 5—This emotionally unstable 50-year-old woman noted that she began to bruise easily in 1941, 9 years before death. Marked exacerbation of this symptom occurred in 1947, three years before her death and two years before diagnosis of subacute leukemia was made. By March, 1947, menorrhagia required 20 pads for each period. Physical examination on July 1, 1947, revealed only marked purpura. The Rumpel-Leede phenomenon was not present. Hemoglobin level was 13.8 gm per 100 cc, erythrocyte count, 3,800,000, reticulocytes, 0.1%, and white blood cell count, 5,800 per cubic millimeter with a normal differential count. Bleeding and clotting times and a bone marrow specimen were normal. A diagnosis of vascular (nonthrombocytopenic) purpura was made. In March, 1948, the patient was given a blood transfusion at another hospital because of hemorrhage that followed dental extraction.

She was seen three times in May, 1948, complaining of pain in her knees after a course of shock therapy. Results of a physical examination were unchanged except for evidence of fluid in the right knee joint. The Rumpel-Leede phenomenon was still absent. Peripheral blood cell counts showed 9 gm of hemoglobin, 3,100,000 red blood cells, 203,000 platelets, and 4,700 white blood cells, with 30 neutrophils, 64 small lymphocytes and 6 monocytes. Bleeding and clotting times were normal. The marrow was still normal with a possible

hyperplasia of immature granulocytes that was not intense enough to even warrant a diagnosis of a leukemoid reaction. No new diagnosis was made.

In October, 1949, the woman returned because of severe menorrhagia, metrorrhagia, epistaxis, and melena. Physical examination again revealed nothing abnormal. There were 26,000 white blood cells, 7.9 gm of hemoglobin, 1,700,000 red blood cells, 7.6% reticulocytes, 48,000 platelets, and a differential count of 7 neutrophils, 61 small lymphocytes, 21 stem cells, 4 promyelocytes, 4 metamyelocytes, and 3 erythroblasts. The bone marrow was indicative of subacute myelogenous leukemia. The diagnosis was, therefore, made 9 months before the patient died and 27 months after a flare up of a hemorrhagic process that had already existed for nine years. Splenomegaly and hepatomegaly were first detected in March, 1950, only four months prior to death and five months after the diagnosis of subacute leukemia was made. Her course was steadily downhill in spite of radiophosphorus therapy and supportive measures. She died in July, 1950.

At autopsy multiple ecchymoses and petechiae, generalized lymphadenopathy, and splenomegaly were seen. There was leukemic infiltration of the bone marrow, liver, spleen, lymph nodes, heart, stomach, urinary bladder, thyroid gland, uterus, and, to a lesser extent, the kidney. These tissues were indicative of acute to subacute myelogenous leukemia on microscopic study.

CASE 6—A 54-year-old woman had had asthma for 27 years. In 1935, she underwent hysterectomy. In July, 1947, she had pneumonia that was treated without complication with penicillin and sulfadiazine. The hemoglobin level and red blood cell count were normal, and there was a leukocytosis, 15,720 white blood cells per cubic milliliter, with 91% neutrophils. She was hospitalized in March, 1948, for an acute asthmatic attack and possible bromide intoxication. Physical examination showed nothing abnormal except for evidence of asthma. Hemoglobin level, red and white blood cell counts, and differential count were normal.

By April, 1950, 11 months before death and 10 months prior to the time a definite diagnosis was made, a white blood cell count of 3,600 per cubic millimeter, hemoglobin level of 13.1 gm per 100 cc, and a red blood cell count of 4,200,000 were recorded. The patient continued to feel well until she noted epistaxis early in December, 1950. By the end of that month, she experienced weight loss, generalized bleeding tendency, continuous fever, and weakness. The findings of physical examination on Feb 3, 1951, were normal except for ecchymoses. There were 9 gm of hemoglobin, 2,600,000 red blood cells, 23,100 platelets, and 450 white blood cells. The differential count showed 7 neutrophils, 59 small lymphocytes, 1 monocyte, 4 myelocytes, 29 stem cells, and 9 erythroblasts. The marrow obtained on Feb 5, 1951, one month before death, was fatty with only occasional stem cells and promyelocytes. A diagnosis of toxic aplasia or aplastic anemia was considered, with early acute leukemia a possibility.

The patient continued a downhill course with repeated chills and fever, progressive hemorrhagic tendency, and, in spite of frequent transfusions, progressive anemia. The white blood cell count varied between 2,000 and 400 per cubic millimeter, with between 37 and 52 stem cells. The platelet count gradually dropped to 13,200. On Feb 12, 1951, a surgical biopsy of sternal marrow revealed a solidly cellular marrow composed almost exclusively of sheets of stem cells. The diagnosis of acute leukemia was made 21 days before the patient died of an intracranial hemorrhage on March 2, 1951. Autopsy was not performed.

CASE 7—This 44-year-old woman was a bookkeeper. She had been sensitive to procaine hydrochloride and had allergic rhinitis. In 1946, she had a hysterectomy. In September, 1950, she had a febrile illness of unknown nature and was told that she was anemic at that time. In December, 1950, 12 months before she died and 11 months before a diagnosis was made, she quit work because of weakness and, in January, 1951, was hospitalized because of ear pain. She was treated with transfusions, liver, and iron.

On Feb 28, 1951, she was admitted to another institution because of weakness, fever, generalized pains, weight loss of

12 lb (5.4 kg), and the development of purpura. Physical examination revealed nothing abnormal except purpura and petechiae. Red blood cell count was 2,600,000 per cubic millimeter, hemoglobin, 8.7 gm per 100 cc, and white blood cell count, 5,800, with 55 neutrophils, 2 eosinophils, 40 lymphocytes, and 3 monocytes. On March 6, 1951, the white blood cell count was 17,400 per cubic millimeter, with 1 stem cell, 1 myelocyte, 86 neutrophils, 8 lymphocytes, and 4 monocytes. On March 16, the white blood cell count had dropped to 2,900, with 47 neutrophils, 8 stem cells, 45 lymphocytes, and 2 monocytes. By March 24, after treatment including transfusions, penicillin, and chloramphenicol (Chloromycetin), the hemoglobin level reached 13.3 gm per 100 cc, and the white blood cell count was 4,050, with a normal differential count. The patient was discharged on March 24, 1951, and readmitted three days later with abdominal and joint pains, chills, and fever. A left pleural effusion was demonstrated roentgenographically. The woman was treated with transfusions intermittently until July, 1951, four months prior to death. At that time the liver and spleen were questionably palpable.

She was admitted here on July 9, 1951, after an attack of purulent acute sinusitis. Physical examination revealed an acutely ill, obese woman with marked generalized purpura. The liver and spleen were not palpable. The hemoglobin level was 7.8 gm, red blood cell count, 2,710,000, white blood cell count, 3,850, platelets, 18,700, and reticulocytes, 14%. The differential count included 67 neutrophils, 24 small lymphocytes, 6 monocytes, 1 stem cell, 1 myelocyte, and 1 metamyelocyte, with 13 erythroblasts. Surgical biopsy showed extreme erythroblastic hyperplasia in a solidly cellular marrow. Splenectomy was performed because of a diagnosis of acute hypersplenism (hemolytic anemia and thrombopenia). The spleen showed red pulp hyperplasia and was twice the normal size.

After splenectomy and transfusions, the hemoglobin level dropped to 9.5 gm, the white blood cell count from 13,000 to 6,000 per cubic millimeter, and platelets rose from 42,900 to 112,000 within 12 days. Reticulocytes averaged 1.5%, and there were no immature cells in the peripheral blood during this period. The patient was discharged on Aug. 2, 1951, and rehospitalized in her hometown on Sept. 4, 1951, with fever, pain, and weakness. There was an intermittent pericardial friction rub but no lymphadenopathy, and the liver was never palpable more than one cubic centimeter below the costal margin. She received transfusions, but her course was steadily downhill. On Sept. 9, the white blood cell count was 9,600, hemoglobin, 9 gm, red blood cell count, 3,300,000, reticulocytes, 6.9%, and platelets, 108,000. The differential count included 68 neutrophils, 29 small lymphocytes, and 3 monocytes. By Sept. 24, the white blood cell count had risen to 37,050, with a differential count of 87 neutrophils, 11 lymphocytes, 2 monocytes, and 24 erythroblasts. On Oct. 2, the differential count showed four stem cells. A diagnosis of acute myelogenous leukemia was made on Nov. 5 when the leukocyte count reached 148,000 per cubic millimeter, with 8 myeloblasts, 7 myelocytes, 21 lymphocytes, 7 monocytes, and 54 neutrophils. During the last month of the patient's life, there continued to be immature granulocytes in the blood. The patient died at the end of November, 1951. An autopsy was not done.

CASE 8—A 75-year-old woman noted a vesicular pruritic rash and urticaria in August, 1949, one year prior to death. She noted some resolution after administration of diphenhydramine (Benadryl) hydrochloride and menthol phenol paste. In April, 1950, she was hospitalized for treatment of the skin rash with diethylstilbestrol (Stilbestrol), calcium, ichthammol (Ichthol), and penicillin. She received soft skin x-ray therapy in May and July, 1950. The hemoglobin level and erythrocyte leukocyte, and differential counts were normal until July 10, 1950, three months before she died. At that time, 2,700 leukocytes and a normal hemoglobin level and differential count were noted. The white blood cell count and percentage of neutrophils dropped thereafter. By Aug. 23, 1950, the hemoglobin level was 10 gm per 100 cc, platelets, 66,000, and white blood cell count, 1,000 per cubic millimeter, with 36 neutrophils, 56 small lymphocytes, and 6 monocytes. Physical

examination showed nothing abnormal except a few petechiae and a blotchy red rash. A bone marrow specimen on Aug. 23, 1950, 16 days before death, was almost completely aplastic, only an occasional stem cell and promyelocyte were found. There was no histological evidence of leukemia.

On Aug. 28, the leukocyte count had reached 600, with a differential count of 17 neutrophils, 68 small lymphocytes, 9 monocytes, 4 basophils, 2 myelocytes, and 2 erythroblasts. The marrow contained an adequate number of erythroblasts and a few islands of granulocyte precursors, it contained 80% fat. On Aug. 31, the leukocyte count had risen to 1,150 with 21% stem cells, the only immature cells in the smear. In spite of the absence of lymphadenopathy or splenomegaly, the diagnosis of acute leukemia was considered six days before the patient's death.

She continued to feel well and physical examination revealed only dermal evidence of a hemorrhagic tendency. The hemoglobin level was maintained at 12 gm per 100 cc by repeated transfusions. The patient was discharged on Sept. 5, 1950, although the white blood cell count had risen to 14,150, the platelets had dropped to 27,300, and the differential count showed 93 myeloblasts, 6 small lymphocytes, 1 myelocyte, and 2 erythroblasts. The patient returned to the hospital three days later and, on physical examination, was found to be acutely ill with a temperature of 104.5 F (40.3 C). Her body was covered with petechiae and purpura. Some small, shotty cervical nodes were found. The peripheral blood counts were 12.7 gm of hemoglobin (after a transfusion), 74,500 white blood cells, 29,700 platelets, 0.5% reticulocytes, and a differential count of 88 stem cells, 8 promyelocytes, 2 myelocytes, and 2 metamyelocytes. The bone marrow was composed almost exclusively of sheets of stem cells, and the diagnosis of acute leukemia was considered unequivocal.

The patient died on the day of admission. At autopsy, a diffuse hemorrhagic process was seen. The liver was enlarged to several centimeters below the costal margin and weighed 1,000 gm. The spleen weighed 420 gm. The marrow was pale yellow to yellow brown in color. There was no unusual lymphadenopathy. Microscopic examination showed leukemic replacement in the bone marrow, spleen, liver, and one lymph node.

CASE 9—A 33-year-old streetcar motorman had noticed weakness since March, 1950, five months before a definitive diagnosis was made and six months before he died. In April, he received three transfusions. His history included an attack of anemia and splenomegaly, with spontaneous remission at the age of 14. He had lost 10 lb (4.5 kg) in two years and was a moderately heavy drinker. Physical examination on April 26, 1950, revealed a pale man with a firm, nontender spleen that could be palpated 3 cm below the costal margin. There was no clinical evidence of a hemorrhagic tendency. The hemoglobin level was 5.7 gm per 100 cc, white blood cell count, 850, platelets, 62,700 per cubic millimeter, reticulocytes, 0.1%, and a differential count of 13 neutrophils, 85 small lymphocytes, 1 monocyte, and 1 metamyelocyte. On microscopic section, the bone marrow was solidly cellular because of extreme erythroblastic hyperplasia, hyperplasia of immature granulocytes, and slight increase in stem cells, it contained a large amount of iron. A diagnosis of hypersplenism was made in spite of the low reticulocyte count. Leukemia was considered. The patient was given a transfusion and discharged on May 11, 1950.

On May 26, he was readmitted because of progressive anemia. Essentially the same physical findings were present except for a few small right axillary nodes. Blood chemistry studies showed 7.5 gm of hemoglobin, 1,750 white blood cells, 135,500 platelets, no reticulocytes, and a differential count of 22 neutrophils and 78 small lymphocytes. Reticulocytes remained absent or greatly reduced until later initiation of experimental phenylhydrazine therapy. A splenic biopsy on May 27 showed normal splenic tissue except for foci of degenerating neutrophils and spectacular amounts of iron. The patient was treated with corticotropin from June 1 to June 12. From June 22 to July 2, 1950, a reticulocyte response of 5 and then 15% was obtained during phenylhydrazine administration. There

was a gradual disappearance of reticulocytes after phenylhydrazine therapy was discontinued. The red blood cell count was maintained at 6 to 10 gm of hemoglobin by means of transfusions. Another bone marrow specimen was obtained four days before the end of phenylhydrazine therapy. This specimen showed 20% fat, an increase in neutrophils, extreme erythroblastic hyperplasia, and iron deposition. The hemoglobin level was 11.3 mg, reticulocytes, 4.8%, leukocytes, 6,100, with 62 neutrophils, 34 small lymphocytes, 2 monocytes, 2 metamyelocytes and 1 erythroblast. The liver was biopsied on July 18 and showed a spectacular amount of iron storage and slight scarring, but no evidence of leukemia was detectable. The patient was discharged on July 20, 1950, two months before he died and one month before a diagnosis of leukemia was made. The diagnosis at that time was leukemia, primary refractory anemia, and secondary hemochromatosis.

The man was readmitted on Aug 20, 1950, because of severe sore throat, fever, and weakness. On physical examination, acute tonsillitis and pararectal abscess were found. Hemoglobin level was 5.7 gm per 100 cc, red blood cell count, 2,100,000, leukocyte count 650, platelets, 64,000 per cubic millimeter, and 6 neutrophils, 92 small lymphocytes, and 2 monocytes. There were no reticulocytes. The abscess was drained, and the patient was treated with penicillin and sulfadiazine. A bone marrow biopsy on Aug 20 five months after onset of symptoms and one month prior to death, showed marked replacement of the marrow by stem cells and very immature granulocytes. The megakaryocytes and the formerly numerous erythroblasts were almost completely gone. A diagnosis of acute myelogenous leukemia was made.

By September, 1950, severe bone pain developed. Physical examination on Sept 14 revealed only shotty cervical nodes, a spleen palpable at the umbilicus, and pain on palpation over both tibias. Seven days later, severe purpura, jaundice, nausea, and vomiting developed, and the patient died on Sept 23, 1950. During the month that he lived after the diagnosis had been made, the leukocyte count remained between 800 and 1,200, and the platelets dropped from 88,000 to 21,000 per cubic millimeter. There was complete absence of reticulocytes on three separate occasions. Stem cells composed from 4 to 33% of the leukocytes in the peripheral blood.

The gross findings at autopsy included a yellowish pallor of the skin, generalized hemorrhages, a spleen weighing 825 gm, and a liver weighing 3,100 gm. In the bone marrow, there was extreme hyperplasia of stem cells and immature granulocyte precursors, but megakaryocytes were fairly numerous. The liver, spleen, and abdominal nodes were infiltrated with stem cells, promyelocytes, and myelocytes. The liver, in addition, displayed spectacular hemosiderosis.

CASE 10—A 58 year old woman had complained of a mild bleeding tendency for 20 years and of ecchymoses since the fall of 1946. In April, 1947, she had two epistaxes. In June and July, 1947, epistaxis became much worse. Physical examination on Aug 4, 1947, revealed an obese woman with numerous ecchymoses over her body, bloody discharge from a ruptured tympanic membrane in the right ear, and clotted blood in both nostrils. The hemoglobin level was 11.2 gm per 100 cc, red blood cells, 3,400,000, leukocytes, 4,200, platelets, 126,000 per cubic millimeter and a differential count of 67 neutrophils, 27 small lymphocytes, and 6 monocytes. Bleeding time was 8 minutes 40 seconds. The marrow was solidly cellular because of hyperplasia of all cell lineages, particularly the immature cells. There were no platelets on the marrow smear. The diagnosis of idiopathic thrombocytopenic purpura was considered, although it was felt improbable because of the intense generalized hyperplasia of the marrow, the platelet count at the lower limit of normal, and the late onset of severe hemorrhagic symptoms.

The patient's course continued unchanged, with platelet counts varying from 147,000 to 34,000 per cubic millimeter but with a drop in the leukocyte count to 3,600. In June, 1950, a fever caused by pneumonitis developed, and, beginning on June 14, the woman was treated with sulfadiazine, acetylsalicylic acid (Empirin) and codeine. After this she became much worse and, on June 17, the hemoglobin level was 8.4 gm red blood cell count, 4,200,000, white blood cell count,

1,350, platelets, 34,000, with 81% neutrophils, 15% small lymphocytes, and 4% monocytes. The leukocyte count fell to 150 by June 21, and, on that day, administration of cortisone was begun, 100 mg every 3 hours and then 100 mg every 8 hours. Two days later, administration of aureomycin and rutin was begun and resulted in excellent subjective relief. The white blood cell count gradually rose to 4,750 by Aug 2, 1950, but the number of platelets remained at about 50,000. No abnormal cells were seen in the peripheral blood except for an occasional erythroblast.

During most of 1951, the patient was continually troubled by purpura and mild chronic anemia, and she was again hospitalized on Sept 19, 1951, because of fever, dyspnea, and weakness. Physical examination revealed a critically ill, feversh woman, with extensive ecchymoses and purpura. The spleen was palpable. There were several light purple, indurated nodules on both arms. The hemoglobin level was 6.5 gm per 100 cc, red blood cells, 2,500,000, white blood cells, 1,100, platelets, 9,900 per cubic millimeter, bleeding time, 6 minutes 30 seconds, clotting time (Lee White), 1 hour and 20 minutes, and reticulocytes, 2.9%. The differential count showed 50 neutrophils, 42 small lymphocytes, and 8 monocytes, with 8 erythroblasts. The Rumpel Leede phenomenon was present. Cortisone was administered on Sept 21. Two attempts to obtain sternal marrow specimens were unsuccessful. On Sept 25, a skin nodule was biopsied. There was a diffuse and nodular inflammatory response, consisting almost entirely of vacuolated mononuclear cells. Several observers agreed the response was not leukemic in nature but probably due to an old lipogranuloma with some recent inflammation. On Oct 8, an ischiorectal abscess developed, it was drained on Oct 12. During the remainder of the patient's hospitalization, the white blood cell count, which had dropped to 300 on Sept 25, gradually rose to 6,100 on Nov 20, 1951. The differential count remained normal, but erythroblasts were continually found.

Since November, 1951, the patient has been seen approximately monthly in the outpatient department. She had taken 50 to 75 mg of cortisone daily until the middle of January, 1952, at which time the use of cortisone was stopped until the middle of June, 1952. She has since been treated with cortisone during a period of hospitalization in February, 1953. During this period of hospitalization, she felt badly, and the severe hemorrhagic process continued without any change related to cessation and resumption of cortisone therapy. On May 20, 1952, the spleen was palpated two fingerbreadths below the costal margin. The leukocyte count varied from 2,500 to 6,100 per cubic millimeter, hemoglobin level from 6.5 to 10.8 gm per 100 cc, and the differential counts normal except for occasional erythroblasts. Platelets varied from 40,000 to 75,000.

The patient was hospitalized on Feb 20, 1953, because of extreme fatigue associated with a hemoglobin level of 5 gm. Physical examination showed nothing abnormal except petechiae, purpura, ecchymoses, and a barely palpable spleen. The peripheral blood counts revealed 12,100 platelets, 4.3% reticulocytes, and a differential count of 55 neutrophils, 29 small lymphocytes, 3 monocytes, 1 metamyelocyte, 12 stab cells, and 5 erythroblasts. A final diagnosis had not been established when this paper was written.

CASE 11—This 61 year old man was a solderer. He had an attack of gallbladder colic in both 1931 and 1942. He noted indolent, purple, scaling, indurated small masses on both legs on July, 1950. Physical examination on Nov 8, 1950, showed nothing abnormal except these masses. The leukocyte count was 8,400, hemoglobin level, 12.5 gm, and red blood cell count, 4 million. The lesions gradually became more indurated and erythematous. Results of physical examination and peripheral blood counts on March 8, 1951, were unchanged except for a drop in the leukocyte count to 5,100. The differential count showed 39 neutrophils, 1 large lymphocyte, 51 small lymphocytes, 6 monocytes, 2 eosinophils, and 1 basophil.

The patient was admitted to the hospital on March 28, 1951, five months before a diagnosis of acute leukemia was made and six months prior to his death. The only pertinent physical finding was the presence of numerous indurated, erythematous, fixed plaques on both legs. Blood chemistry studies on March 12, 1951, revealed 11.5 gm of hemoglobin, 3,800,000 red blood cells, 4,700 leukocytes, 26,700 platelets, and 44 neutro-

phils, 1 eosinophil, 44 small lymphocytes, and 11 monocytes. The bone marrow was slightly hyperplastic because of an increased number of erythroblasts, but there was a decrease in the number of granulocytes because of maturation arrest at the metamyelocyte stage, only occasional adult granulocytes were seen. Toxic depression of the marrow was suspected. The patient's skin lesions cleared slowly with penicillin therapy. He had one attack of typical gallbladder colic on April 1, 1951.

Early in May, 1951, right upper quadrant pain developed and radiated into the patient's back. Cholecystectomy was performed on May 15, 1951. Sections of a surgical biopsy of the liver showed a nonspecific, poorly defined, granulomatous portal infiltrate. Postoperatively the patient's course was stormy and a pleural effusion developed. The temperature rose to 38°C, and continued malaise and anorexia were present. Acid fast bacilli were reported on May 21 from specimens of sputum collected in the middle of April. The liver and spleen were palpated by one observer. Treatment with streptomycin was begun. Because of the possibility of a subphrenic abscess, a transthoracic exploration of the right upper quadrant was performed on June 16, 1951. No lesion was found. Marrow from the resected rib showed a definite increase in granulocyte precursors and a decrease in erythroblasts and megakaryocytes but was clearly not leukemic. The blood cell count on June 25 showed 5,050 white blood cells, 95 gm of hemoglobin, and 3,300,000 red blood cells. A differential count was not done. The patient was discharged on June 27, 1951.

Because of continued fever, weakness, and weight loss, the man was readmitted on July 26, 1951, two months before he died. He appeared chronically ill, a lymph node was palpated in the right axilla, the liver was felt 2 cm below the costal margin, and the spleen was questionably palpable. There was no evidence of unusual bleeding or bruising. The hemoglobin level was 6 gm per 100 cc, red blood cell count, 2,100,000, white blood cell count, 12,350, platelets, 146,300 per cubic millimeter, reticulocytes, 7.7%, and a differential count of 17 neutrophils, 15 small lymphocytes, 3 monocytes, 50 myeloblasts, 6 promyelocytes, 7 myelocytes, and 2 metamyelocytes. The bone marrow on July 27, 1951, showed further increase in cellularity due to hyperplasia of extremely immature granulocytes, decrease in erythroblasts and megakaryocytes, and increase in iron. Acute myelogenous leukemia or a leukemoid reaction caused by tuberculosis were strongly suspected two months prior to death. The patient continued a downhill course in spite of treatment with streptomycin.

On Aug 20, 1951, the hemoglobin level was 9.2 gm and the red blood cell count 2,700,000 in spite of repeated transfusions. The leukocyte count was 7,100, platelets, 93,500, reticulocytes, 0.9%, and a differential count included 12 neutrophils, 1 eosinophil, 26 small lymphocytes, 8 monocytes, 52 stem cells, and 1 metamyelocyte. The bone marrow on the same day showed diffuse sheets of stem cells, with some promyelocytes. A diagnosis of acute myelogenous leukemia was made one month before death. Purpura and edema developed, and the patient died on Sept 28, 1951. At death, the number of platelets had dropped to 22,000, hemoglobin remained unchanged because of constant transfusion, and the leukocyte and differential counts were unchanged.

At autopsy, the gross findings were generalized, moderate lymphadenopathy, generalized petechiae and ecchymoses, hepatomegaly, and splenomegaly. Microscopically there were infiltrations of hematopoietic tissues with stem cells and immature granulocyte precursors in the liver, adrenal glands, and testes. Active disseminated tuberculosis, and hemosiderosis.

CASE 12—A 57-year-old woman was first seen in the surgical clinic on March 31, 1950, 11 months prior to death and 10½ months before a diagnosis was made. She complained of generalized aching and pains in her bones of four weeks' duration. At that time, physical examination, hemoglobin level, and red and white blood cell counts were normal. Between March 31 and April 4, 1950, there was marked weight loss, and the patient was admitted to the hospital for study. Except for moderate joint tenderness, physical examination showed nothing abnormal, the hemoglobin level and red and white blood cell and differential counts were normal. Roentgenograms showed extensive, diffuse demineralization of bone. A diagnosis

of postmenopausal osteoporosis was made. The woman was bothered by recurrent attacks of sinusitis until July, 1950, when stomatitis developed. In October, 1950, a bruising tendency developed.

On Nov 2, 1950, she was again hospitalized because of purpura, painful cervical lymphadenopathy, sinus pain, nasal discharge, and sores in her mouth. The results of physical examination verified these complaints. The hemoglobin level was 8.2 gm per 100 cc, red blood cell count, 2,800,000, leukocyte count 1,850, platelets, 39,600 per cubic millimeter, reticulocytes, 1.6%, and differential count, 7 neutrophils, 86 small lymphocytes, and 7 monocytes. Bleeding and clotting times were normal. A bone marrow specimen was normal except for maturation arrest in the granulocytes and questionable increase in the number of stem cells. A diagnosis of toxic depression of the bone marrow was made, and all medication was stopped except for the administration of penicillin.

The patient's condition remained unchanged, although the leukocyte count gradually rose to 7,000, and 46 erythroblasts appeared in the blood by the end of November, 1950. The painful cervical nodes resolved, and the oral lesions healed. By Dec 4, 1950, the differential count included two myeloblasts, six myelocytes, two metamyelocytes, and nine erythroblasts, and the leukocyte count was 7,000. During December, there was continued fever, anorexia, and recurrent buccal ulcers, but physical examination was otherwise normal. Repeated differential counts continued to show immature cells in the peripheral blood. Aplastic anemia, either idiopathic or the result of a toxic substance or leukemia was considered to be the most probable diagnosis. By Jan 20, 1951, there was bleeding from the rectum, and the spleen was palpated for the first time. The leukocyte count had risen to 8,000 per cubic millimeter, with 9 neutrophils, 10 small lymphocytes, 69 medium lymphocytes (lymphoblasts), 1 monocyte, 5 myeloblasts, 5 promyelocytes, 1 myelocyte, and 17 erythroblasts. A bone marrow specimen at that time was solidly cellular primarily because of an increase in the number of stem cells and immature granulocytes, although the number of erythroblasts and megakaryocytes was adequate. A diagnosis of acute myelogenous leukemia was made 11 months after onset of the disease and three weeks before the patient died.

By Feb 14, 1951, she was much worse. Purpura was grossly manifest, but the liver and spleen were not felt. There was no lymphadenopathy. The leukocyte count was 16,300, platelets, 14,300, reticulocytes, 6.5%, and differential count, 37 neutrophils, 20 small lymphocytes, 1 monocyte, 1 eosinophil, 6 medium lymphocytes, 25 stem cells, 7 myelocytes, 3 metamyelocytes, and 12 erythroblasts. The patient was given 20 mg of corticotropin intramuscularly for two days and, then, 50 mg daily until she died on Feb 19, 1951. The hemorrhagic tendency was not benefited by toluidine blue, and the woman died of a cerebral hemorrhage.

The major abnormality in the gross findings at autopsy was evidence of a widespread hemorrhagic process. The hematopoietic organs were not enlarged. Large areas of stem cells were found in lymph nodes, and most of the bone marrow was replaced by the same cells, while erythroblasts, neutrophils, and megakaryocytes were greatly reduced in number. The sinusoids of the liver and the red pulp of the spleen were filled with stem cells, but the architecture was still preserved.

COMMENT

A major consideration is whether or not the conditions described in these 12 cases, because of the long duration of symptoms, actually should be classified as acute leukemia. The final diagnosis, however, logically rests on the terminal clinical, hematological, and anatomic findings. On this basis, final opinion must be reserved in the patient in case 10 because she is still alive. That case is reported because the course resembles that of the preleukemic phase manifested by the other 11. The patient in case 7 had a very characteristic terminal clinical course that was manifested by an overwhelming increase in the number of immature cells in the peripheral blood,

anemia, thrombopenia, fever, and generalized hemorrhagic process, but, as has already been stated, leukemoid reactions may mimic this pattern. The presence of splenomegaly, however, without myeloid metaplasia, as well as severe thrombopenia make leukemia a probable diagnosis. Unfortunately, no tissue studies were available from the last four months of the patient's life and permission for autopsy was refused, therefore, the diagnosis is not as clearcut in this case (case 7) as in the others. The patients in cases 1, 4, 8, 9, 11, and 12 had terminal clinical, hematological, and autopsy findings characteristic of acute leukemia. Those in cases 2 and 6 had terminal clinical courses and peripheral blood and bone marrow findings of acute leukemia, but other tissues were not available because permission for autopsy examination was refused. The patient in case 3 had a clinical course and peripheral blood values characteristic of acute leukemia, but the bone marrow was not pathognomonic of this disease, and no evidence of leukemia was found in other tissues. The short duration of the leukemic state from a few days to one and one-half months, except in case 4 (4 to 20 months) and case 5 (9 months), indicates an acute or, at most, subacute course.

The possibility still remains that these 12 patients manifest a divergent type or variant of acute leukemia that, in past years prior to the use of transfusions and antibiotics, was fatal because anemia or intercurrent infection developed before the leukemic phase was reached. At a recent meeting at which this paper was presented, we were told of four similar cases by physicians in the audience. In our 12 patients, the cause of death, hemorrhage, is still the major cause of death in acute leukemia.

Ten of the 12 patients (table 1) were women, all of whom were menopausal or postmenopausal, although there was a very wide variation in age and in duration of menopausal state, as well as in whether menopause was spontaneous or induced. The age of the patients is not too unusual, since acute leukemia is, except in childhood, commonest in the older age group. In the few similar cases reported in which the preleukemic state was studied, the majority¹⁰ of patients were not menopausal women. It is probable that the patients in Mallarmé's case^{10f} and Scholtz's case 4¹¹ were menopausal women. In the mouse, the incidence of leukemia is enhanced by estrogens and decreased by androgens, and spontaneous mouse leukemia is commoner in older than in younger mice.¹²

Six of our patients had allergies of various types, and all six experienced a period of neutropenia, with atrophy and maturation arrest of the bone marrow characteristic of a toxic neutropenia. During the two to three years of this study, at least seven other patients with toxic neutropenia have been seen. They had characteristic atrophy and maturation arrest of granulocytes in the bone marrow, and, during the recovery phase, granulocytic hyperplasia developed, with maturation arrest of the bone marrow severe enough to be classified as leukemoid but without progression into leukemia. Furthermore, two of these seven patients were menopausal women. A similar hyperplastic marrow stage, sometimes coinciding with the presence of immature cells in the peripheral blood, has been described in agranulocytoses, which is also

predominantly a disease of middle aged women.⁹ Consequently, we did not believe that the diagnosis of acute leukemia was warranted at that stage in the preleukemic phase of the disease.

One of the most striking points was the long duration of the preleukemic as compared to the leukemic phase. The classic histological criteria of acute leukemia, overwhelming of the bone marrow by stem cells, with or without extremely immature granulocyte precursors, and marked decrease in the number of megakaryocytes and erythroblasts, did not develop in some patients until shortly before death. For example, the criteria for the diagnosis of acute leukemia were not fulfilled in cases 1, 2, 3, 6, 7, 8, 9, 11, and 12 until less than two months prior to death and after a preleukemic phase of 3 to 17 months.

An extreme situation was met in case 8 in which peripheral blood studies were not indicative of leukemia and aplastic marrow with a few areas of regeneration were found only 16 days before death. Eight days before death, there were 21 myeloblasts in a leukocyte count of 800 per cubic millimeter. A hiatus leukemicus was noted three days before death. On the day of death, a bone marrow specimen indicative of acute leukemia was found for the first time. Unfortunately, marrow studies were not available during the last 16 days of life, but it would seem extremely unlikely that this patient reached a leukemic state more than 3 to 8 days prior to her death.

The longest duration of the leukemic phase (case 4) was probably 20 months, this patient's disease would, therefore, be in a subacute category. Because of the lack of tissue studies, exact determination of the end of the preleukemic phase could not be made, although it was almost certainly after 10 months.

The onset of acute stem cell or acute myelogenous leukemia is rapid and there is rarely opportunity to study the prodromal phases.¹³ In the available literature, we have been able to locate only 12 reports¹⁴ in which a preleukemic phase was studied. The patients reported by Folley^{14b} were Japanese persons exposed to an atomic bomb blast approximately two to five years prior to their death. Some of those patients were still living in 1951, but apparently no studies were available during the preleukemic phase. The majority of these persons had an acute leukemic phase of the stem cell or myelogenous variety. The other patients described in the literature had a preleukemic phase varying from two and a half years^{10a} to a few weeks,^{10c} and all had an extremely acute leukemic phase of the stem cell or myelogenous variety.

The experience almost uniformly reported is that physical evidence in the preleukemic phase in both men and women is characterized by only purpura and necrotic, poorly healing mucous membrane lesions but not by palpable enlargement of the hematopoietic organs.¹⁵ Folley's patients^{14b} almost certainly passed through a phase in which the hematopoietic organs were smaller than normal as judged by clinical¹⁶ and experimental animal studies¹⁷ on total body irradiation. In Scholtz's patient,^{11a} a woman, the spleen was barely palpable, and there were oral petechiae at the onset of the disease, 18 months before the development of the leukemic phase when hepatomegaly and a sudden spectacular increase in splenomegaly were noted. It is probable

that Beyers' patients, reported to have aplastic marrows, already had leukemia when first seen.¹⁸ These phenomena are in agreement with our experience, since palpable abnormal enlargement of nodes, liver, or spleen was usually delayed until a true leukemic state was reached.

Purpura, usually mild, was the first abnormal physical sign in nine patients. It preceded the date of diagnosis by months or days, except in the two men (cases 9 and 11). In these two men, the spleen was palpable two to four months before the diagnosis was made. In one woman, the spleen was questionably palpable for a short time. Lymphadenopathy was never found until the diagnosis had been verified microscopically. In case 12, no enlarged organs were found even at autopsy. Except in the men, abnormal enlargement of hematopoietic organs was, therefore, a late development restricted to the leukemic phase alone.

Each patient, regardless of the length of the preleukemic phase, had clinical manifestations of a deficiency of at least one facet of marrow hematopoiesis, such as anemia, leukopenia, thrombopenia, or various combinations thereof. The woman in case 5 had an abnormal bruising tendency at least three and possibly eight years prior to the time that diagnosis was made, and a hemorrhagic process was apparent early in two patients (cases 4 and 5). In cases 1, 2, and 9, anemia was the earliest major problem and, in cases 3, 6, and 12, infection, presumably secondary to or aggravated by neutropenia, presented the first major problem. Very early in the preleukemic phase, the patient in case 7 showed evidence of infection, hemorrhagic phenomena, and anemia. It is noteworthy that in almost each patient clinical evidence of bleeding or bruising preceded objective laboratory abnormalities.

In the patients in the preleukemic stage reported on in the literature, there also was evidence of more than one type of marrow insufficiency. In several reports, one aspect was sufficiently prominent so that the cases might be classified as those in which protracted anemia was the major problem,¹⁹ neutropenia, with bouts of infection and degenerating lesions of the mucous membranes, were most prominent,^{13b} and those in which the classic concept of aplastic anemia, with anemia, thrombopenia, and neutropenia, was simulated.²⁰ It is probable that, in the persons exposed to an atomic bomb blast,^{14b} there was also a phase in which the symptoms were due to aplastic anemia. It must be emphasized, however, that in both our patients and those reported on in the literature, regardless of the most prominent type of onset, there was some evidence of an abnormal hemorrhagic tendency early in the course of the disease. These, of course, are entirely different from the cases of chronic leukemia described by Minot²¹ and Wintrobe,²² in which, while the disease was asymptomatic, unequivocal chronic leukemia was present. It must be emphasized that, in the preleukemic phase, there was no unequivocal evidence of leukemia in either the peripheral blood or biopsy specimens of the marrow or, in the few instances in which such material was available, in the liver or spleen.

The lack of indications of leukemia in the peripheral blood characterized the preleukemic period in all patients, although other abnormalities were noted. One of the earliest changes in two or three of our patients, as

well as in the three described by Mallarmé,^{10c} was severe neutropenia, with fairly normal absolute count of small lymphocytes. Even in the rest of our patients, depression of the number of neutrophils in the blood tended to precede and be severer than lymphopenia, this is similar to the experience of Ehrlich and Forer.^{10b} Even in cases in which anemia was the early prominent problem,¹ lymphopenia occurred later than did neutropenia.

In our patients, immature leukocytes began to appear in the peripheral blood within a week or two after the diagnosis of acute leukemia was made on other grounds. In case 9, peripheral blood findings were not diagnostic of leukemia until two weeks before the patient died and two weeks after the diagnosis had been made by bone marrow aspiration. Case 4 is the only one that represents the other extreme, immature cells in the peripheral blood were sufficiently numerous 26 months before death to suggest the diagnosis. Similar prolonged preleukemic phases, without immature leukocytes, have been reported, some as long as 3 years^{10a} but most on the average of 6²⁴ to 18²⁵ months from the time the patient was first seen. Naturally, if one were to include the months during which there were noticeable symptoms, the preleukemic phase, without immature white blood cells in the peripheral blood, would be much longer.

Another point that must be emphasized in this connection is that the diagnosis of acute leukemia cannot be based on the presence of immature cells in the peripheral blood. Large numbers of white blood cells, including myeloblasts, may accompany nonleukemic diseases particularly myeloid metaplasia,² agranulocytosis,²⁶ aplastic anemia,⁶ carcinomatosis,²⁷ skin rashes,²⁸ and numerous other hematological diseases.²⁸ Spectacular examples have been described by Herz²⁹ (55 stem cells and 24,000 leukocytes) and by Sotilo-Ortiz³⁰ in a case of carcinoma of the ovary (12 stem cells, 12 myelocytes, and 7 meta myelocytes and a white blood cell count of 940,000).

A major problem has been the evaluation of the large numbers of monocytes seen frequently in our patients at about the time that immature cells first began to appear, a phenomenon not appreciated by most observers except Collins^{10a} and Leya.^{10b} As long as even such a capable hematologist as Naegeli^{13a} comments on the difficulty of distinguishing, in dry smears, between monocytes and myelocytes and metamyelocytes, it will be impossible to determine whether the monocytosis seen is actually because of confusion of this cell type with the myelocyte.

The finding of large numbers of erythroblasts in the peripheral blood in the past has seemed to contradict the diagnosis of leukemia.³⁰ It is of interest that each patient except those in cases 9 and 11, the two men, had significant numbers of erythroblasts at varying times. In cases 3 and 4, there were periods in which 50 erythroblasts were counted. In case 9, even though the response to cortisone and corticotropin was reticulocytosis, there were never any erythroblasts noted in the peripheral blood, megaloblasts were never found. In case 1, the only case in which there was extreme erythroblastic hyperplasia of the marrow, and cases 4 and 9, in which there was marked marrow erythroblastic hyperplasia, peripheral blood erythroblastosis was not most marked. In all cases, erythroblastosis was not correlated with erythroblastotic marrow.

Several other authors²⁹ have described a preleukemic phase characterized by erythroblastic crises, but only Heilmeyer and Schoner have presented clearcut evidence of megaloblastosis in the marrow in the modern sense of a cell lineage characteristic of pernicious anemia.³⁰ In some instances,³¹ erythroblastosis reached a spectacular degree.

Reticulocytes are commonly accepted as indicative of new production of red blood cells in the circulating blood. All of the patients except the one in case 9 had significant periods of reticulocytosis, with counts running usually from 1 to 7%. Even in case 9, the reticulocyte response to phenylhydrazine was 15%. Unfortunately, there is very little material in the literature on reticulocyte response of patients in the preleukemic phase. In Foy's patient, there was a reticulocyte response of 14% after therapy with liver,^{10c} but it is possible that this reticulocytosis had nothing to do with treatment and was purely incidental, since there was no response evident in the red blood cell count or hemoglobin. In Heilmeyer's^{10d} cases, there was a reticulocyte response of 5 to 11% (case 1) and of 15 to 35% in another (case 2), neither of these was apparently affected by treatment with a variety of hematinics or blood transfusions.

The relationship of the onset of purpura to that of thrombopenia is difficult to interpret because, in the majority of our cases and probably in those reported in the literature, the platelet count was usually not checked until after some evidence of a hemorrhagic tendency was noted. In cases 1, 2, 8, 11, and 12, platelet counts were available at about the time that abnormal bruising was first noted, and, in each case, the platelet count was depressed. In case 2, a normal platelet count was obtained one month prior to the onset of clinically evident purpura. In cases 3, 4, and 5, there was an abnormal bleeding tendency but a normal number of platelets for periods ranging from six months to two years prior to the demonstration of a thrombopenia. In case 9, the platelet count was 62,000 in April, 1950, and there were numerous other low and low normal counts, but unusual bleeding or bruising did not develop until a few weeks prior to the patient's death. In the other cases, adequate information on early platelet counts is lacking. Unfortunately, it is difficult to correlate our results with those in the literature, since, in most cases, platelet counts were not made in the preleukemic state. In the few available, it would appear that abnormal bleeding and thrombopenia developed simultaneously.

Although a detailed consideration of the histogenesis of the disease will be made in a future publication, there are some points of practical diagnostic interest derived from the tissue studies. Examination of the spleen when the diagnosis was made (case 3), three months before diagnosis (case 7), and three and one-half months before diagnosis (case 9) failed to yield any conclusive evidence of leukemia, although there were some minor abnormalities, barely suggestive of leukemia. Similarly, examination of the liver six months before the diagnosis was made (case 1), when the diagnosis was strongly suspected (case 3), and three weeks before the diagnosis was made (case 9) failed to yield any conclusive evidence of acute leukemia. The numerous bone marrow specimens, except in case 4, seemed to follow one general pattern that in-

cluded the presence of aplasia and maturation arrest in the granulocyte series, sudden or gradual shift to hyperplasia with maturation arrest of the granulocytic lineage, and then, as the change to leukemia ensued, an overwhelming of the marrow by stem cells and immature granulocyte precursors. Up to this final malignant change, the bone marrow specimens presented a sequence of histological patterns seen in acute toxic neutropenias of the type caused by drugs. Erythropoiesis varied in these early biopsies from extreme activity to extreme aplasia.

The differential diagnoses considered during the preleukemic phase (table 2) were primary refractory anemia, with hyperplastic marrow, aplastic anemia, primary or secondary thrombocytopenic purpura, hypersplenism of a pure or mixed type, toxic neutropenia, and miliary tuberculosis, with a leukemoid reaction. The major problem of differential diagnosis was toxic neutropenia that was considered a strong possibility in cases 3, 6, 8, 9, 10, and 12. Even in retrospect, in reviewing the information available and knowing the final diagnosis, it is still impossible to separate these cases from those of toxic neutropenia any earlier than had been done by the

TABLE 2—Possible Diagnoses Considered in Preleukemic Phase

Case	Diagnosis
1	Primary refractory anemia with hyperplastic marrow and acquired hemolytic anemia
2	Toxic aplasia of marrow and acquired hemolytic anemia
3	Hypersplenic neutropenia and toxic neutropenia
4	Primary or secondary thrombocytopenic purpura
5	Nonthrombocytopenic purpura
6	Primary or secondary aplastic anemia
7	Hypersplenism
8	Toxic neutropenia and primary or secondary aplastic anemia
9	Hypersplenism, primary refractory anemia with hyperplastic marrow and secondary hemochromatosis
10	Primary or secondary thrombocytopenic purpura and toxic neutropenia
11	Toxic neutropenia and tuberculosis with leukemoid reaction
12	Postmenopausal osteoporosis, toxic neutropenia, and aplastic anemia

criteria employed. In cases 1 and 9, the diagnosis was confused with that of primary refractory anemia with hyperplastic marrow of the type described by Bomford and Rhoads³² because of extreme anemia, erythroblastic bone marrow, and low reticulocyte counts. A diagnosis of hypersplenism was made in case 7 because of reticulocytosis, increased fecal urobilinogen, neutropenia, and thrombopenia. That patient's bone marrow was so cellular at the time that the validity of the diagnosis should have been suspected even though leukemia was not suggested. In cases 4 to 5, the onset was manifested by hemorrhagic diathesis, and splenectomy was considered because of the possibility of idiopathic thrombocytopenic purpura. The patient in case 11 was known to have tuberculosis, and, when splenomegaly and hepatomegaly developed, miliary tuberculosis was thought to be a possibility. It was only later that the bone marrow and peripheral blood gave evidence of leukemia. True aplastic anemia was considered in cases 6, 8, and 12, because of the clinical picture, decrease in all elements in the peripheral blood, and aplastic bone marrow tissue.

A similar variety of clinical findings has been described in the literature. Cases are reported in which the preleukemic state resembled aplastic anemia²⁴ and others in which there was extreme erythroblastic or megaloblastic

blastic proliferation or primary refractory anemia with hyperplastic marrows,^{10c} pernicious anemia,^{8a} toxic neutropenia,^{7a} and thrombocytopenic purpura. The difficulties that may arise in separating these conditions from even the full-blown case of acute leukemia have already been mentioned.

SUMMARY

A preleukemic phase, preceding the development of true acute leukemia, is described as found in studies of 10 and possibly 11 cases of acute leukemia and of one case of subacute leukemia. Ten of the 12 patients were women, and 6 had an allergic diathesis. Physical examination in the preleukemic state, except in the two men, revealed nothing abnormal except fever, evidence of abnormal bleeding, and, occasionally, mucous membrane ulcers. Palpable enlargement of hematopoietic organs usually was first encountered after the leukemic phase had begun. The preleukemic period, which was much longer than the leukemic period in all but one patient, was marked by deficiency of at least one type of marrow function. A hemorrhagic tendency, usually accompanied by thrombopenia, was the commonest early expression of this marrow malfunction. Neutropenia was found comparatively early and preceded the disappearance of small lymphocytes. Monocytosis was fairly common but was hard to evaluate because of the difficulty in differentiating these cells from myelocytes. Erythroblastosis and reticulocytosis, sometimes of spectacular degree, were common.

Immature cells tended to appear in the peripheral blood toward the end of the preleukemic phase, but peripheral blood characteristic of acute leukemia was first seen in the leukemic phase. Biochemical determinations yielded nonspecific results except for the fairly common finding of hyperbilirubinemia and increased fecal urobilinogen indicative of hyperhemolysis.

In the preleukemic phase, the most characteristic early change in the marrow was the development of maturation arrest and aplasia of granulocytes, which was accompanied by an erythroblastic tissue that varied from extreme aplasia to extreme hyperplasia. Thereafter, progressive hyperplasia and maturation arrest of granulocyte precursors developed until the marrow was largely replaced by stem cells and promyelocytes, this marked the beginning of the leukemic phase. Examination of the few available liver and spleen biopsies in the preleukemic phase failed to reveal any marked abnormality. Occasional stem cells were seen in the splenic red pulp immediately prior to the development of the leukemic state.

The major problem in differential diagnosis was the resemblance of the preleukemic state to various blood dyscrasias, especially toxic neutropenia, aplastic anemia, or hypersplenism. This problem in differential diagnosis was not clarified until the leukemic state developed. The leukemic state was almost invariably acute and, in some cases, explosive with regard to its course and resistance to the usual palliative measures.

CONCLUSIONS

On the basis of clinical observations, peripheral blood cell counts, and tissue studies, the preleukemic phase of acute leukemia is described and differentiated from the leukemic phase of acute leukemia.

ADDENDUM

Since this paper was written, we have seen acute myelogenous leukemia develop in five patients, four men and one woman. One patient had secondary polycythemia due to congenital heart disease and was treated with radiophosphorus. Another had polycythemia vera that was treated with radiophosphorus, during the period of treatment, myeloid metaplasia and then terminal acute myelogenous leukemia developed. One patient had lymphosarcoma treated with x-ray therapy, and in the fourth case, the disease was idiopathic. The woman had carcinoma of the breast treated by resection and irradiation, specially of the long bones. The disease pattern of these five patients resembled that described here with regard to the preleukemic and leukemic phases.

CLINICAL NOTES

ACUTE LEUKEMIA IN TWINS

Jean V. Cooke, M.D., St. Louis

The rare observation of more than one person with leukemia in the same family has suggested this report. Acute leukemia affected each of fraternal twins during their second year of life. One twin died at the age of 18 months and the other at the age of 24 months.

REPORT OF CASES

Members of the family included the father, 29 years of age, mother, 32, a son, 9, three daughters, 8, 5, and 4, and the twin boys. The family lived in a small Illinois town. The twin boys, Terry and Jerry, were born Aug. 4, 1943. These twins did not resemble each other closely and were said, by the attending physician, to be fraternal and not identical twins. During pregnancy, the mother was said to have had toxemia with edema, albuminuria, and pyuria.

Jerry weighed 5 lb. 8 oz. (2,494.8 gm.) at birth and gained weight regularly and satisfactorily. He had had no disease and only infrequent, mild respiratory infection. He had received no immunizations. His development was normal. When he was 22 months of age, he was admitted to the hospital on June 5, 1945, with the report that three weeks previously sore throat, fever, and swollen cervical nodes had developed. The fever and sore throat had subsided after therapy with sulfadiazine, but the glandular swelling had persisted. During the week previous to admission, he had been noted to be pale. Several 'bruised' areas had appeared on his skin, and he had seemed moderately irritable.

On examination, the positive findings were pallor, very slight fever, moderate irritability, several moderate sized ecchymoses on the legs and back, slightly enlarged, firm spleen, and moderately enlarged liver that extended 5 cm. below the costal margin. All superficial lymph nodes were slightly enlarged and firm, those in the right posterior cervical region were large enough to be visible. Blood examination showed a moderate anemia with a hemoglobin level of 7.8 gm. per 100 cc. and leukocytes 13,800 per cubic millimeter. The clotting time was 4.5 minutes and the bleeding time more than 15 minutes. A blood smear showed marked decrease in platelets, and 95% of the cells were mononuclear leukocytes, most of which were a young blast type. Jerry was given two transfusions of 250 cc. each and discharged on June 8, 1945, with the diagnosis

From the Department of Pediatrics, Washington University School of Medicine, and the St. Louis Children's Hospital.

of acute leukemia His mother wrote that for two weeks thereafter he was feverish and irritable but then appeared much better for several weeks Later the abdomen, possibly the spleen, became swollen and the neck glands larger, and there was considerable hemorrhage from the gums The hemorrhage continued, although the swelling of the neck and abdomen subsided Jerry died on Aug 3, 1945, the day before his second birthday

Since it was stated by the parents that the other twin, Terry, had died from leukemia a few months previously, the record of his illness was obtained from the physician who had treated him in the Alton Memorial Hospital and who supplied the following data

Terry weighed 4 lb (1,814.37 gm) at birth and did not gain weight quite so well as his twin, but he had no serious illness and developed normally At the age of 17 months, he was noted to have fever and hemorrhagic areas on the skin For the next month, his appetite was poor, and he lost weight and refused to walk On admission to the hospital on Jan 25, 1945, he had a severe anemia, scattered purpuric spots on the skin, and a moderately enlarged spleen Laboratory examination showed erythrocytes 1,900,000 per cubic millimeter and hemoglobin (3.5 gm per 100 cc) The leukocyte count was 97,000 per cubic millimeter, with 96% lymphocytes and very scanty platelets A transfusion was given, and, within three days, the leukocyte count fell to 2,000, with no granular form seen and only slight increase in hemoglobin (5.1 gm per 100 cc) Terry rapidly became weaker and died on Jan 29, 1945 Necropsy was not permitted

COMMENT

Familial leukemia or those instances in which two and occasionally more relatives have suffered from the disease have been noted very infrequently Most hematologists have shared the view expressed by Naegeli¹ who saw only one case of familial leukemia in 25 years, a woman had myelosis, and her brother had chronic lymphadenosis Naegeli stated "with the large number of leukemic patients one must expect the probability of such a chance occurrence" Recently, Videbaek² has critically reviewed the published familial reports and has found only 26 that he considers authentic examples He has also made a thorough and laborious investigation of the relatives of 209 patients with leukemia and found that 17, or 8.1%, of such patients had one or more relatives with the disease Since, in a few reports, the families were related, he was able to add 13 families to the 26 previously reported as having more than one member affected Most of the affected persons were adults, and all types of the disease were represented, although more than two-thirds of these persons had chronic forms Half of all patients were over 50 years of age Videbaek believes it likely that hereditary factors may be of etiological significance in the development of the disease Such an assumption must also assume that all types of leukemia are very closely related to one another, in spite of the striking clinical and hematological differences

Acute leukemia, which comprises at least 95% of leukemia in children, occurs with moderate frequency, since between 1940 and 1949 it was reported that an average of 1,100 children under 15 years of age died of leukemia each year in the United States In the literature, Jelke³ in 1940 reported the disease in monozygous twins who died at the ages of 4 and 5 months, and Riel⁴ in 1948, reported on monozygous twins both of whom died at 3 years of age The only other record of the disease in siblings is its remarkable and unique occurrence in five of eight siblings in one family reported by Anderson⁵ All of the af-

ected children died between the ages of 5 and 8 years In this family, there was no other case of leukemia in 135 near or distant relatives While it is possible that other unreported instances have occurred, familial leukemia is of such interest and rarity that it appears likely that most instances would be reported At the St. Louis Children's Hospital, over a period of years, no known near relative of 316 children with acute leukemia was known to have suffered from the disease except the twins described The only other twin in our series was a girl who died from acute monocytic leukemia at 2 years of age Her identical twin sister is healthy eight years later Certainly, so far as acute leukemia in children is concerned, the clinical incidence indicates the absence of any hereditary or familial factors in its etiology except in twins

The only other reported occurrences of leukemia in twins were by Dameshek, Savitz, and Arbor⁶ who observed identical twin brothers both of whom died from atypical chronic lymphatic leukemia at 56 years of age and within 10 weeks of each other and by Stobbe and Taeschner⁷ who reported identical twins who died from chronic lymphatic leukemia at the ages of 59 and 71 years

SUMMARY

Fraternal twins who died from acute leukemia at the ages of 18 and 24 months are reported with brief comment on the familial aspects of the disease

The Influenza Virus.—The influenza A virus is a parasite whose only natural host is man To survive, it must pass continually from one human being to another, but from the very effectiveness of its means of transfer—it is inhaled and lodges in the respiratory tract—it soon finds itself in the position epidemiologists call "exhaustion of susceptible hosts" In other words, almost the entire population becomes immune In such circumstances there are two ways by which a highly transmissible virus can survive It may, like mumps or measles, live at the expense of the newborn and become a children's disease Or it may meet the situation, as the influenza virus does, by a transformation of character—a mutation that enables it to overcome its host's immunity The importance of such mutations is emphasized by their swift race over the world In 1946 a new type of A virus was isolated in Melbourne Australia is a long way from the great centers of population in the Northern Hemisphere But within a year the new virus was causing widespread influenza in those distant places Influenza vaccines from previous types of virus were powerless against that sudden epidemic of February, 1947 Their failure, incidentally, was largely responsible for our first serious recognition of the importance of the influenza viruses' continual change in type—F M Burnet, M.D., The Influenza Virus, *Scientific American*, April, 1953

MYOCARDIAL INFARCTION IN PREGNANCY

REPORT OF A CASE WITH NORMAL SPONTANEOUS DELIVERY SEVEN MONTHS LATER

Henry J Brock, M D

Nelson G Russell, M D

and

Clyde L Randall, M D, Buffalo, N Y

This case is being reported because of the paucity of information on myocardial infarction in pregnancy. No reference to acute myocardial infarction during pregnancy can be found in such standard textbooks as Eastman,¹ Greenhill,² Beck,³ and others.⁴ Moreover, only one cardiology reference book was noted to mention the subject. Levine⁵ states that he had treated one woman, aged 22, for myocardial infarction and that subsequently she had gone through a pregnancy. A search of current literature revealed no account of the conduct of pregnancy during or immediately following myocardial infarction. Therefore, it seems likely that the analysis of this case may help others in managing similar cases and serve to stimulate additional reports on the same subject.

REPORT OF CASE

A 34-year-old white woman was first seen on Jan 18, 1952, at 1 a m. For two days she had noted severe substernal pain radiating to both elbows. That evening the pain had become constant and prostrating in character. She was slightly relieved standing up or sitting up and extremely dyspneic lying down. Moreover, she reported her last menstrual period had begun on Nov 17, 1951. In three previous pregnancies terminating in normal spontaneous delivery she had given birth to three normal children, aged 14, 12, and 3 years at this time. Her third labor had totaled six hours. During her second pregnancy there was a history of toxemia, with edema of the legs, albuminuria, and elevation of the blood pressure. Since that time she had continued to have moderate hypertension. Nocturia was denied. No family history of hypertension and cardiovascular renal disease was elicited. One great aunt was diabetic.

When she was first examined at home, physical examination revealed a well-developed, well-nourished woman who appeared acutely ill. Her oral temperature was 99.8 F, pulse 96, respiration rate 20, and blood pressure 158/98 mm Hg. Her face was flushed. Ophthalmoscopic examination of the fundi revealed no abnormality. Palpation, percussion, and auscultation of the chest also revealed no abnormalities. Examination of the heart revealed the sounds of fair quality with no murmurs and no enlargement. The abdomen appeared normal, with no tenderness nor organ enlargement. No abnormalities of the extremities were noted. She was hospitalized at 6 a m Jan 18, 1952, following the reading of an electrocardiogram indicating an acute anterior wall myocardial infarct.

Laboratory Findings—On Jan 19 the red blood cell count was 5,200,000, the hemoglobin level 14.5 gm per 100 cc, and the white blood cell count 18,000, with 8% band forms, 82% filaments, and 10% lymphocytes. On March 6 the red blood cell count was 4 million, the hemoglobin level 11.3 gm, and the white blood cell count 8,800, with 11% band forms, 71% filaments, 1% eosinophils, 16% lymphocytes, and 1% mono-

cytes. The sedimentation rate on Jan 19 was 15 mm per hour, on Jan 21 15 mm, on Jan 22 25 mm, and on March 6 23 mm. On Jan 18 the blood glucose level (fasting) was 193 mg per 100 cc and the blood urea 8 mg. On Jan 22 the serum cholesterol level was 186 mg, cholesterol esters 37 mg, and blood lipids 522 mg. On Feb 22 the alkaline phosphatase level was 3.1 Bodansky units, calcium 10.2 mg, phosphorus 3.1 mg, albumin 4.1 gm, and globulin 2.0 gm. On Jan 18 the prothrombin time was 13 seconds. On Feb 2 results of a glucose tolerance test were reported as follows: The fasting level was 104 mg per 100 cc, at 30 minutes 226 mg, at 1 hour 364 mg, at 2 hours 386 mg, and at 3 hours 286 mg. The urinary glucose levels were as follows: the fasting level, 0, at 1 hour 1+, at 2 hours 3+, at 3 hours 3+, and at 4 hours 3+. Wassermann and Kahn tests were negative. Six routine urine samples revealed a specific gravity ranging from 1.022 to 1.012, a trace of albumin on two occasions, and a trace of glucose on two occasions. No sediment was found except on Jan 30, when from 50 to 75 white blood cells per high power field were found, and the urine smear revealed many gram-negative bacilli. *Escherichia coli* were found on culture. Results of renal function tests were as follows: On Feb 18 the result of a phenolsulfonphthalein test in the first 15 minutes was 95 cc with 10% dye, in the next 45 minutes 35 cc with 30% dye, and in the second hour 55 cc with 10% dye. On Feb 18 the urea clearance in the first samples was 50 cc or 93% of the standard clearance with average normal function and in the second sample 56 cc or 103% of the standard

Comparison of serial electrocardiographic tracings of the patient. The first two electrocardiograms reveal the acute changes of anterior myocardial infarction. The last two electrocardiograms reveal residual changes with marked regression.

clearance with average normal function. Serial electrocardiograms revealed the classical picture of acute anterior myocardial infarction (figure). On Feb 16th an x-ray film of the chest revealed the lung fields to be clear, with slight enlargement of the left ventricle, the transverse cardiac diameter measured 12.5 cm and the transverse thoracic diameter measured 25 cm. A second chest film taken on Sept 16 showed no change from the previous film.

Hospital Course—During hospitalization, treatment consisted of administration of bishydroxycoumarin (Dicumarol), papaverine, sedative agents, including morphine, and an 800-calorie diet. During the first week the patient had a low-grade fever and substernal pain persisted, but after the first week these symptoms disappeared completely. Bishydroxycoumarin therapy was maintained for 28 days, and the prothrombin time was kept between 30 and 35 seconds. The blood pressure was 190/130 mm Hg on admission and gradually dropped to 106/68 on the 27th day of hospitalization. On Jan 28 the blood pressure in both arms was 150/110 and in both legs 240/210. Tests for pheochromocytoma were not done. Examination of the urine four times daily revealed an occasional trace of glucose during the day or night. The patient's weight dropped from 140 lb (63.6 kg) at the time of admission to 126 lb (57.3 kg) at the time of discharge from the hospital. At the time of the initial examination of the chest, a few fine crepitant rales were heard.

From the Department of Obstetrics and Gynecology, Buffalo General Hospital and University of Buffalo.

at the right base, after the first week the chest remained clear. Auscultation of the heart revealed a 2+ soft systolic murmur at the apex and a 1+ faint systolic murmur at the pulmonic area. The patient was kept on bed rest for six weeks, after which she gradually resumed normal activities and was discharged from the hospital on March 13, 1952.

After considerable discussion it was finally decided to allow the patient to carry the pregnancy to term. Although the patient had considerable anorexia, epigastric distress, and very slight edema of the ankles, after hospitalization she had no dyspnea nor orthopnea. On physical examination no abnormality of the lungs was revealed. The heart sounds continued to be of good quality, usually with murmurs. The regimen of restricted activity continued, including 12 hours of bed rest per day plus the usual dietary restrictions.

On Aug 24 the patient reentered the hospital, complaining of severe epigastric pain and uterine contractions every 12 minutes. At the time of hospitalization she weighed 138 lb (62.7 kg), her pulse was 92, and her blood pressure was 180/103. On Aug 26 with the patient under low saddleblock spinal anesthesia a full term normal baby boy, weighing 6 lb 10 oz. (3,005 gm), was delivered by low forceps.

On Aug 27 both tubes were ligated with the patient under intravenous thiopental (Pentothal) sodium anesthesia. The postpartum course was uneventful. The fasting blood glucose level was 81 mg. and 98 mg. on two successive days, and the digestion glucose level was 222 mg. Because of the latter finding it was concluded that this patient had mild diabetes mellitus. The infant's bleeding time was three minutes and the clotting time one minute, but unfortunately his prothrombin time was not obtained. On Sept 3, one week after delivery, the mother and infant left the hospital in good condition.

COMMENT

This case illustrates the value of a conservative approach to the problem of pregnancy associated with myocardial infarction. Therapeutic abortion was seriously considered because of the acknowledged strain of advancing pregnancy on an already severely damaged heart. It was recognized that the cardiac output is increased 50% in the last trimester of pregnancy,⁸ accounting for the consequent danger of congestive heart failure that might be expected to occur in 25% of cases of myocardial infarction some time after the acute episode.⁹ During this acute episode, however, it seemed unwise to consider interference because shock, the soft necrotic cardiac tissue, and the possibility of systemic or pulmonary emboli contraindicated anything other than supportive therapy.

During pregnancy, we believe that anticoagulant therapy should be given¹⁰ as in any similar case, for it seems to have no deleterious effect on placental circulation, uterine behavior, nor the condition of fetal blood. In this instance, the bleeding and clotting time of the infant immediately after delivery were normal. We believe that there were distinct advantages in waiting seven months for the occurrence of normal labor rather than adding stress of induced abortion during the second or third month of pregnancy. Certainly, we could assume that the scar in the heart would be firmer at term. We also felt we could anticipate less cardiac strain during a normal delivery in a multipara whose previous labor had been easy than would occur with delivery by cesarean section. This patient had a diabetic blood glucose tolerance curve at the time of the acute infarction and an elevated digestion blood glucose seven months later. Consequently, it was concluded that this patient had diabetes mellitus de-

spite the fact that it is known that many patients with acute myocardial infarction have diabetic glucose tolerance curves.⁷

SUMMARY AND CONCLUSIONS

A 34-year-old white woman with mild diabetes mellitus and moderate essential hypertension sustained an acute anterior wall myocardial infarct when two months' pregnant. She made a good recovery and carried to term without incident and delivered a normal full-term living child. Although no definite conclusions can be based on this experience, it would seem plausible to suggest that coincident pregnancy should not interfere with nor alter the management of myocardial infarction and that all usual measures, including anticoagulant therapy, are indicated. When the patient survives an initial episode in the first trimester, there is ample time for the heart to regain considerable reserve and the pregnancy may be carried to term with a normal delivery—the latter course probably involving less cardiac strain than interruption of the pregnancy earlier in the course of myocardial recovery.

VALUE OF ROUTINE BLOOD SUGAR TESTS IN THE DETECTION OF DIABETES MELLITUS

E P McCullagh, M D

and

R E Zwickel, M D, Cleveland

For the past 30 years, it has been the practice of our group to perform routine blood sugar tests on all new patients. Because we believe that this is an important method of detecting diabetes, this paper is presented in order to illustrate some of the results we obtained. Our method is advocated for general use in office practice. If all physicians who demand that a complement fixation test for syphilis be performed on all patients would obtain a blood sugar test as well, many cases of early diabetes would be detected.

MATERIALS AND METHODS

This study presents data on the number of new patients in our practice who, solely because the initial blood sugar level was elevated, were later proved to have diabetes. A total of 2,357 consecutive patients entering all services of the diagnostic division of the Cleveland Clinic constitutes the basis of this survey. The majority of these patients were adults, many of them were past middle age. They applied for care during the four week period between Jan 10 and Feb 7, 1951. The total includes 57 patients who had either symptoms of diabetes or previously recognized diabetes or who exhibited glycosuria that would have led to a diagnosis of diabetes on the original examination.

From the Cleveland Clinic and the Frank E Bunts Educational Institute

Blood sugar determinations were made by the modified Meyer's picric acid method. A comparison of this method with Benedict's and the Somogyi-Nelson procedures for blood glucose determination showed no significant differences. Hyperglycemia was considered to be present if the blood glucose levels were above a line drawn connecting the successive points on the following time curve: fasting blood glucose, 110 mg per 100 cc, one-half hour after a meal, 200 mg, one hour after, 180 mg, two hours after, 140 mg, and three or more hours after a meal, 110 mg. In all patients with hyperglycemia in whom it was practical, a glucose tolerance test was performed. If this was not possible, a blood sugar determination was repeated two and one-half to three hours after a meal, and an attempt was made to have the meal contain 100 gm of carbohydrate.

RESULTS

There were 113 patients with no history of diabetes in whom tests demonstrated some degree of hyperglycemia without glycosuria on the first urinalysis. The diagnosis of diabetes would, therefore, not have been made in any

Summary of Results of Follow-Up Studies of 113 Patients Suspected to Have Diabetes on the Basis of Hyperglycemia Alone

Range of Blood Sugar Level	No of Patients Suspected to Have Diabetes	No of Patients in Whom Diagnosis Confirmed *	No of Patients in Whom Diagnosis Refuted *	No of Patients Not Followed Up
111-120	49	6	15	29
121-130	18	3	4	11
131-140	15	7	5	3
141-150	6	1	2	3
151-160	3	1	1	1
161-170	2	1	0	1

190 or above	10	2	7	1
	113	22	38	53

* Diagnoses were confirmed or refuted by results of second blood sugar determination and/or glucose tolerance test.

of these patients if a blood sugar test had not been performed. In only 60 of these patients with hyperglycemia did we conduct further studies to corroborate or refute the tentative diagnosis. There were many reasons for which further investigations were not carried out in the other 53. Many patients lived some distance from the clinic and wished to have recommendations for repeated blood sugar or glucose tolerance tests sent to their attending physicians at home. Some were seriously ill of

other diseases that shortened life expectancy and that rendered any evaluation of borderline blood sugar levels of little importance. In some cases, the physician in charge was not convinced of the need for further tests, since hyperglycemia was slight or questionable, such as blood sugar levels obtained while the patient was in a fasting state or three hours after he had eaten that were only slightly above the 110 mg per 100 cc range. Attention is directed, however, to the fact that, of 20 patients with blood sugar levels between 110 and 120 mg per 100 cc while in a fasting state or three hours after eating, investigation showed 5 to have undiagnosed diabetes. A few patients could not be followed-up other than by repeating the fasting blood sugar test. In some of these patients, we were obliged to use a normal fasting blood sugar level to refute a tentative diagnosis of diabetes that had been made on the basis of hyperglycemia one to three hours after eating. In doing this, some patients almost certainly have been excluded from the diabetic group who would have been included had they undergone a glucose tolerance test.

In the table, the number of patients with hyperglycemia without glycosuria is shown and the distribution indicated. As might be expected the largest number lies in the groups having blood sugar levels closest to normal. Little difference is shown in the frequency of diabetes found at the various original blood sugar levels. This is because the time that elapsed between eating and the time of the test is considered in the interpretation of each value. In most instances, the actual elevation of blood sugar above the normal was slight. As mentioned before, 53 patients were not studied by us after the first tests. Of the 60 investigated, 22 new diabetic patients were found. If the remainder had been similarly studied and had the same incidence occurred, 16 more cases of diabetes would have been recognized.

COMMENT

The insidious onset of diabetes is a considerable hindrance to its recognition, since clinical symptoms are usually absent.¹ As is generally recognized, a single urinalysis in a diabetic patient is often sugar-free, especially in patients in whom the disease is mild.

The importance of detection of diabetes while the condition is mild depends eventually on two chief factors, first, the number of people who have diabetes and, second, whether or not early treatment and control as complete as is now possible can lessen or prevent serious complications, such as renal failure, blindness, or arteriosclerosis. The incidence of diabetes in our population has been variously estimated in the past few years at 1%² and 1.7%,³ and it has been calculated that it will eventually involve 2.1% of men and 3.8% of women.⁴

There are good reasons for believing that complete control leads to fewer complications. The benefit of complete control is recognized by Frederick M. Allen and Elliot Joslin, two great students of diabetes. Important statistical studies also support this view. For example, Wilson⁵ and Root⁶ showed that patients in whom careful control was maintained for more than 20 years had fewer complications than those who were managed less carefully. White⁷ showed that children with severe diabetes

were more susceptible to early and serious complications than those with a mild form of the disease, and Boyd⁸ presents data that indicate that children for whom a rigid discipline was prescribed had fewer complications than those for whom other regimens were prescribed. In Boyd's studies, only 2 of 42 patients who had childhood diabetes for 10 years or longer showed evidence of retinal hemorrhage. In the first of these two, diabetes had been present for 18 of her 20 years of life, and, in the second, there had been several years of noncontrol. Others⁹ disagree with this attitude toward control and believe that there is no convincing data to show that the severity of the disease and/or the degree of control parallel the frequency or severity of the complications. We believe that, unless more dependable and more conclusive data to the contrary can be produced, the safest course available includes early detection and early, careful treatment.

SUMMARY

In order to assess the value of routine blood sugar tests, the results in 2,357 consecutive new patients are reviewed. The group includes 57 patients (2.4%) who were known to have diabetes or in whom the disease was diagnosed because of glycosuria. Diabetes was suspected in 113 patients who exhibited hyperglycemia but not glycosuria. Further blood sugar determinations or glucose tolerance tests done on 60 of these persons resulted in the discovery of 22 new diabetic patients (0.93%).

Assuming that a proportionate number of diabetic persons could be found among the patients with hyperglycemia but not glycosuria whom we did not follow up, there would have been 16 additional new diabetic patients or 0.68% of the whole group. If this additional group is added to the two groups previously considered, the incidence of diabetes in the entire group of patients is estimated to be 4%.

It is suggested that routine blood sugar determinations performed at random may increase the number of known diabetic patients from 2.4 to approximately 4%.

Injury to Spine During Lumbar Puncture—Symptoms of spinal injury characterized chiefly by severe back pain, muscle spasm over the lumbar area, tenderness over the lumbar spine, and difficulty in bending, stooping, or lifting, may occur immediately or as long as six months after lumbar puncture. In most of the cases [reported] intervertebral disc or vertebral injury occurred following difficult spinal puncture. Radiographic changes are characterized chiefly by thinning of the intervertebral disc and sclerosis, rarefaction and destruction of the vertebral body. These changes may occur from as early as eighteen days following the puncture to as long as six months after the puncture. The type and extent of the injury caused by the puncture needle is more important in regard to the rapidity of the onset of the symptoms than is the age of the patient or the purpose of the puncture. Treatment of the condition consists essentially in proper immobilization of the spine supplemented by antibiotic therapy if osteomyelitis develops. Emphasis is made of the necessity for sterile technique and careful introduction of the needle in performing lumbar punctures. Utilization of a different level should be practiced if spinal fluid is not obtained easily at the original puncture site.—S. F. Redo, M.D., Spinal Complications Following Lumbar Puncture. *Surgery*, May, 1953

SURVIVAL FOR TWENTY-NINE YEARS IN CHRONIC LYMPHOCYTIC LEUKEMIA

Arthur A. Marlow, M.D.

and

Grant R. Bartlett, Ph.D., La Jolla, Calif.

The diagnosis of leukemia is considered a death sentence, and, in older age groups, it produces an unwarranted degree of fear on the part of patients with chronic leukemia as well as in their relatives. The average length of life in 129 patients with chronic lymphocytic and 236 patients with chronic myelocytic leukemia collected from various sources was reported as 3.52 and 3.34 years, respectively, by Wintrobe and Hasenbush.¹ Moffitt and Lawrence² selected 16 patients with chronic lymphocytic leukemia and 15 patients with chronic myelocytic leukemia of long duration and calculated the average rates

TABLE 1—First Available Laboratory Report of Patient in Case Report

	Findings *	Normal
Color Index	0.75	1.0
Erythrocytes	5,000,000	4,500,000 to 5,000,000

of survival after diagnosis as 8.16 and 6.33 years. Many individual patients, however, exceed this average survival rate by many years. These patients can often be kept in happy, productive states for long periods of time by careful management. McGavran's³ report of lymphocytic leukemia of 25 years' duration is of unusual interest.

We report a case in which the well-documented diagnosis of lymphocytic leukemia was made in 1923. The patient died 29 years later, in 1952. We have been unable

to find a report of a patient with leukemia who survived as long as 29 years

REPORT OF A CASE

A white, married, retired businessman, aged 73, was referred to us for treatment with radioactive phosphorus on June 12, 1951. His chief complaint was fatigue, which he had noted for approximately one year.

The present illness began in April, 1923, at which time the patient was admitted to the Broad Street Hospital in New

York City for treatment of an infected mosquito bite on the left side of his head. The leukocyte count at that time was said to be 65,000 per cubic millimeter, and a diagnosis of lymphocytic leukemia was made. X-ray therapy was started, and potassium arsenite (Fowler's) solution was given by mouth. The patient retained many of the copies of his blood counts, and the earliest available count was made on Dec 28, 1923 (table 1).

Several courses of x-ray treatment were given between 1923 and 1928. The patient retired from business in 1925 because of the diagnosis and established residence in the Los Angeles area of California. No x-ray treatment was given from 1928 to 1931, and then an unknown number of x-ray treatments were given until 1945. No further specific treatment had been given after 1945. The patient stated that he had felt fairly well but that he tired rather easily until about one year before he was referred to us when he noticed increasing fatigue.

The patient had had pneumonia and pleurisy two or three times at the age of 6 or 7. Peritonsillar abscess occurred several times in early adult life until the tonsils were removed.

TABLE 2—Summary of Blood Studies and Treatment in Patient with Leukemia, 1923 to 1952

† X-ray therapy and administration of potassium arsenite (Fowler's) solution continued through 1928

York City for treatment of an infected mosquito bite on the left side of his head. The leukocyte count at that time was said to be 65,000 per cubic millimeter, and a diagnosis of lymphocytic leukemia was made. X-ray therapy was started, and potassium arsenite (Fowler's) solution was given by mouth. The patient retained many of the copies of his blood counts, and the earliest available count was made on Dec 28, 1923 (table 1).

Several courses of x-ray treatment were given between 1923 and 1928. The patient retired from business in 1925 because

in 1913. An operation for "a ruptured appendix" was performed in 1935. The family history disclosed no instance of leukemia or other blood dyscrasia.

Physical examination revealed a well-developed man of average spare nutrition who did not appear ill. He was 69.5 in (176.5 cm) tall and weighed 140 lb (63.5 kg). Temperature, pulse, and respirations were normal. The blood pressure was 180/100 mm Hg. The skin and mucous membranes were normal. Mild hypertrophic changes of the finger joints were the only abnormalities of the skeleton and extremities. There

was no enlargement of the peripheral lymph nodes. The retinal arteries showed moderate narrowing and tortuosity and increased light reflexes, but further examination of the head and neck revealed no important abnormalities. On examination, the lungs were normal. The heart was not enlarged and the sounds were clear and regular. A soft systolic murmur was present over the precordium, with a maximum at the apex that was not transmitted. The tip of the spleen was palpable at the left costal margin, but no other abdominal masses were present. The external genitalia were normal. The prostate was slightly enlarged but of normal consistency. Deep tendon reflexes were normal, and no abnormal reflexes were present.

Laboratory examination revealed a hemoglobin level of 9.8 gm per 100 cc. (65%), red blood cell count 3,440,000 per cubic millimeter, and white blood cell count 240,000 per cubic millimeter, with a differential count of 200 cells that yielded 96% lymphocytes and 4% neutrophils. The lymphocytes were predominantly mature, a moderate number of smudges were present, there was slight anisocytosis of erythrocytes, and the platelets were decreased to 110,000 per cubic millimeter. The bone marrow was hyperplastic, the megakaryocytes were normal in appearance and distribution, and the lymphocytes were mature. The differential count revealed 95.1% lymphocytes, 0.6% myeloblasts, 2% neutrophils, and 2.3% normoblasts. The blood type was group O, Rh positive. The bleeding time was 3 minutes, and the clotting time was 16 minutes by the Lee and White's method (normal for this laboratory, up to 20 minutes). Clot retraction was complete in 24 hours. Reaction to the Kahn test was negative. On urinalysis, the fluid was clear and straw colored. The specific gravity was 1.016, and there was no albumin or sugar. The sediment contained occasional red and white blood cells and hyaline casts. The blood sugar was 98 mg per 100 cc and the urea 56 mg per 100 cc. The stool contained no blood, ova, or parasites. A roentgenogram of the chest showed that the right costophrenic angle was obliterated by adhesions. There was no evidence of enlarged mediastinal lymph nodes. Another roentgenogram showed that the lower edge of spleen was just below costal margin. An electrocardiogram showed nothing abnormal.

There was some question as to the desirability of further specific treatment of the leukemia but it was undertaken because of the patient's complaint of increasing fatigue. As he did not desire another course of irradiation, 16 mc of radioactive phosphorus were given in small, divided doses by mouth between Aug 9, 1951, and Dec 4, 1951. There was no important change in the patient's condition, and transfusions were given in December, 1951, because of increasing anemia. A generalized exfoliative dermatitis occurred in January, 1952, and the patient's condition deteriorated steadily with an increase in nitrogen retention until sudden death occurred on April 19, 1952. The blood urea had risen to 120 mg per 100 cc on April 18, 1952, the day before death, although urinary output had averaged 1,000 cc every 24 hours. Phenobarbital could not be ruled out as a cause of the exfoliative dermatitis, although skin biopsy revealed specific infiltration with lymphocytes. In two other patients with chronic lymphocytic leukemia, we have had similar experiences with exfoliative dermatitis that followed irradiation and that presented no indications of drug sensitization. It was felt that little was accomplished by our attempts at treatment (table 2).

Autopsy was performed on April 21, 1952, and indicated (1) chronic lymphocytic leukemia, (2) arteriosclerosis, (3) coronary arteriosclerosis, grade 2 and 3, (4) nephrosclerosis, grade 3 to 4, (5) occlusion of the left circumflex coronary artery, and (6) small, left posterior myocardial infarction.

SUMMARY AND CONCLUSIONS

Survival for 29 years is reported following well-documented diagnosis in a case of chronic lymphocytic leukemia. It is felt that an optimistic viewpoint is desirable in chronic leukemia, as the life expectancy of certain patients far exceeds that reported to be the average in large series of patients.

CHEMICAL LABORATORY

This is the second of several reports on cigarettes, cigarette smoke, and filters by the Chemical Laboratory of the American Medical Association. The first report appeared in THE JOURNAL, July 4, 1953, page 917.

WALTER WOLMAN, PH D, Director

A STUDY OF CIGARETTES, CIGARETTE SMOKE, AND FILTERS

2 Special Low Nicotine Cigarettes

There is considerable difference in the nicotine content of the various types of tobacco used in cigarettes. Bailey and Petre¹ and Bogen² reported the following approximate values for nicotine content of several types of cigarettes:

Type of Cigarette	Approximate Content % Nicotine
Blended	1.0-2.7
Virginia (flue-cured)	2.5-3.4
Levantine	1.0-1.5
Denicotinized	0.8-1.4
Puerto Rican	0.8-1.2

A typical modern blended cigarette contains approximately the following proportions of tobacco¹:

Flue-cured	60%
Burley	15%
Maryland	10%
Levantine types	15%

Some of the more inexpensive brands omit the Levantine types.

The nicotine content of flue-cured tobaccos was found to range from an average of 2.36% for the low nicotine South Carolina tobacco (U S type 13) to 3.36% for the higher nicotine Danville tobacco (U S type 11)³ for the five years 1928 through 1932. Burley tobaccos, on the other hand, contain more nicotine than flue-cured tobaccos. A nicotine content of about 3.5% is probably representative for this type. Maryland tobacco and Levantine types have a relatively low nicotine content. Bailey and Petre¹ found 2.12 and 2.26% nicotine in the leaf web of a sample of Maryland tobacco from the 1930 season.

These nicotine values are subject to considerable variation, depending on the position of the leaf on the plant, weather conditions during the growing season, type of tobacco, region of growth, and cultural practices. The values reported by Bailey and Petre¹ for the Maryland tobacco grown in 1930 were high because hot, dry weather had prevailed during the growing season. A sample of the same grade and type from the 1932 crop gave values of 0.86 and 0.83% nicotine.

Many investigators have reported that the nicotine content of the leaf increases from the bottom to the top of the plant. Darkis and his collaborators⁴ reported that the nicotine in flue-cured tobacco from a good growing season ranged from 1.94% in the lower leaves (secured by the first priming—a method of harvest in which leaves are pulled from the plant as they mature) to 3.76% in the upper leaves (the sixth priming), with a composite sample containing 3.04% nicotine. This

4 Darkis F R, Dixon L F, Wolf F A and Gross P M. Flue Cured Tobacco: Correlation between Chemical Composition and Stalk Position of Tobaccos Produced under Varying Weather Conditions. J Indust Engin Chem 28:1214-1223, 1936.

entire range will not appear in tobacco destined for cigarettes, however, since generally the leaves from near the middle of the plant are employed for this purpose. Most of the remainder goes into other smoking mixtures and chewing tobacco.

Tobaccos for the so-called denicotinized cigarettes are prepared from regular tobaccos. According to Bailey,⁵ they are usually prepared by a resweating process. This is accomplished by treatment of the tobacco with superheated steam or by heating in vacuum chambers. Numerous other processes are based on the extraction of the nicotine by organic solvents or on the treatment of the tobacco with the vapors of an aqueous ammonia solution. These vapors decompose the naturally occurring salts of nicotine (oxalate, acetate, citrate, and malate), and the free nicotine is entrained in the vapors.

Certainly the term "denicotinized" is a misnomer, as it would connote "nicotine free" to the uninitiated, and the presently available brands contain about one half the nicotine found in 'regular' cigarettes. Pyrik⁶ has proposed the terms 'nicotine poor' for tobacco containing 0.5 to 0.6% nicotine and 'nicotine free' for tobacco containing 0.1 to 0.15% nicotine. None of the tobaccos examined are nicotine-free in this sense.

The tobacco used in the cigarette designated as brand G in this report was developed by the Kentucky Agricultural Experiment

The methods of analysis used and the conditions employed have been described in the first report.⁸ Briefly, 47 mm of each cigarette was smoked (two-thirds of a 'standard' 70 mm cigarette) using 35 ml puffs of two seconds duration taken once a minute.

Brand G is the only cigarette examined thus far that has contained significant quantities of normicotine. Normicotine differs chemically from nicotine in that the nitrogen atom of the pyrrolidin ring is not methylated. The figures in column 6 of the table were obtained by the method of the Association of Official Agricultural Chemists⁹ with the exception of the figure for brand G. These figures for brand G were obtained by the method of Bowen and Barthel,¹⁰ which quantitatively measures the amounts of both normicotine (0.45%) and nicotine (0.31%). The value found by the Association of Official Agricultural Chemists method for the total steam volatile alkaloids including normicotine was 0.79%.

As in the first report, the figures in column 8 of the average volume of mainstream smoke (smoke emerging from the puffed end of the cigarette) per cigarette were obtained by multiplying the average number of puffs required to smoke 47 mm of a cigarette by the volume of each puff (35 ml). The figures in column 10 showing the proportion of nicotine transferred from the smoked portion of the cigarette to the mainstream

ment Station⁷ from three strains of low nicotine Cuba cigar tobacco obtained in 1933 from the Kaiser Wilhelm Institute. This tobacco was crossed with burley in order that the new variety should carry the recessive color factors of burley because burley is a light-colored tobacco when cured and light color is commonly associated in the mind of the public with mildness.¹¹ The varieties resulting from the crosses and back crosses of the low-nicotine cigar tobacco with burley are like burley but have a low nicotine content. They have been designated a subtype of burley and have been established as class 3, type 31-V, air-cured tobacco by the United States Department of Agriculture.

This report gives the results of smoking experiments on two brands of so-called denicotinized cigarettes, brands E and F, and one brand of cigarette containing the tobacco especially bred for its low nicotine content, brand G. Brand D, the "regular" cigarette from the first report,⁸ is again included for comparison.

smoke are again relatively constant as in the first report, with the exception of brand G.

The weight of nicotine found in the mainstream smoke as shown in column 9 shows that the smoke of the "denicotinized" brands E and F contains about one half the nicotine found in the smoke of a "regular" cigarette, brand D. The amount of tars in the smoke of these cigarettes does not differ materially from the tars found in the smoke of brand D as shown in column 11. The smoke of brand G contains significantly less nicotine than that of other brands but it contains a greater amount of tars.

The Cervix.—The abnormal cervix should be treated. All anatomic defects should be repaired, cauterized or coned away. There should be no erosion and no visible infection present. The anatomic and histologic external os should correspond. The bacterial flora of the vagina should also be examined. The acidity of the vagina should be aided by lactic acid douches and not by acetic acid in the form of bacterial laden vinegar that is so often prescribed, and the normal Döderlein bacillus should be restored and maintained if possible. Every woman should have her cervix examined at least once a year, between the ages of 38 and 55, twice a year is looked upon with approval by all well trained and experienced gynecologists. Every cervix must be examined with suspicion, and those patients with any irregular bleeding, hypermenorrhea, postcoital or postmenopausal bleeding should be repeatedly examined and treated by intelligent radicalism.—C. E. Galloway, M.D., The Abnormal Cervix, *The Surgical Clinics of North America*, February, 1953.

COUNCIL ON PHARMACY AND CHEMISTRY

REPORT TO THE COUNCIL

The Council has authorized publication of the following reports

R T STORMONT, M.D., Secretary

AN IMPROVED TEST OF SPERMICIDAL ACTIVITY WITHOUT DILUTION OR MIXING

Clarence J Gamble, M.D
Milton, Mass

Comparisons of the clinical effectiveness of contraceptive materials are difficult and subject to large errors because of the unavoidable variations in the correctness and regularity of their use. Attempts to limit observations to those who are regular users are disappointing, many who claim regularity as long as the method is successful may report irregularity of some duration after a pregnancy leads to detailed interrogation. These uncertainties in clinical testing have led to a search for laboratory procedures that may give an indication of clinical efficiency.

SPERMICIDAL TESTS INVOLVING MIXING AND DILUTION

Baker made a careful study of spermicidal powers by mixing equal quantities (0.3 cc) of semen with physiological salt solutions (0.9% sodium chloride) in which various concentrations of pure substances were dissolved. He determined the lowest concentration of the substance in the final mixture that would immobilize the sperms in human semen in 30 minutes.¹ In testing jellies and suppositories, he and his collaborators mixed 2 gm of one suppository with 6 cc of saline and found the greatest dilution of the filtrate that would stop the motion in 30 minutes.² He applied these tests to many pure substances and commercial contraceptives.

Voge recommended the study of motion of the sperms after shorter exposures. He measured immobilization times after mixing jellies with equal or double volumes of semen.³

To permit the study of many mixtures with the same ejaculate, Brown and Gamble⁴ used about 0.04 cc of semen. They based their comparisons on the period of time required for complete immobilization after thorough mixing. When equal quantities of semen and contraceptive material were mixed (approximating the ratio found in clinical use), the duration

of motility was so brief that distinctions could not be made between the more and the less active mixtures. Therefore, the contraceptive jelly was diluted with 0.9% sodium chloride solution. Final proportions of jelly, 0.9% sodium chloride, and semen of 1:4:5, respectively, gave conveniently distinguishable immobilization times. The recorded time was that of the immobilization of the last discoverable sperm. This method is used as one of the criteria for acceptance of contraceptive materials by the Council on Pharmacy and Chemistry of the American Medical Association.⁵

The 'saturation test' of Millman⁶ measures the quantity of human semen required in successive additions to 0.05 cc of jelly to immobilize the sperms within one minute after thorough mixing. For some mixtures, as much as 18 times the volume of the jelly is required. Under the usual clinical conditions this proportion would correspond to an ejaculate of about 90 cc. This is so far beyond the usual quantity that it seems doubtful that differences at such dilutions have clinical significance.

SPERMICIDAL TESTS WITH UNDILUTED CONTRACEPTIVE MATERIALS

Baker, Ranson, and Tynen² recognized that the ability to release immobilizing material without stirring and dilution was an important characteristic of a contraceptive mixture. In an experiment termed a diffusion test, the jelly or suppository was smeared over the bottom of a glass capsule and overlaid with 1.25 cc of human semen. At varying times portions of the latter were removed and examined for motility.

This modification seems a closer approach to postcoital conditions than mixing and dilution. However, the repeated sampling introduces a stirring not present in the vagina, and the procedure gives no indication whether the sample of semen examined comes from the portions in immediate contact with the spermicide or from the higher portions of the fluid.

AN IMPROVED DIFFUSION METHOD

To approximate vaginal conditions, a procedure has been developed in which sperms are observed in semen that is in direct contact with the spermicidal material. For convenience in presentation this will be described in the form considered most desirable. The experiments and reasoning that led to the steps and arbitrary dimensions recommended will be given subsequently.^{6a}

Semen, which is secured from young donors by ejaculation into a vial, is stored in an ice bath. It is customarily used for the test one to three hours after production.

Glass tubes of 2 mm internal diameter and approximately 2 cm long are prepared. Semen, held in a pipette of the eye dropper variety, is run into the end slightly more than 5 mm.

To secure a part of the contraceptive mixture that has not been affected by evaporation, the first portion (about 2 cc) of the contents of the flexible metal tube in which it is usually supplied is discarded. The jelly-filled mouth of the tube is placed against the end of the semen column. The latter has been slanted downward at about 45°, making it bulge slightly from the end of the tube to avoid trapping an air bubble between it and the jelly. The jelly is forced into the glass tube for a distance of 10 mm or more, displacing the semen, which is not allowed to reach the other end of the tube.

To prevent evaporation, paraffin (which melts at about 56°C) is heated to just above the melting point and is swabbed onto each end of the tube. Possible contamination of the semen with jelly from tubes that have been sealed previously is avoided by using one dish of paraffin for the semen ends of the tubes and another for those containing the jelly.

This tube, with another of the same diameter, is placed on a microscope slide and covered with a coverglass, the adjacent surfaces of the latter two have been smeared with microscope immersion oil. The length of the semen column is now measured, using the mechanical stage of the microscope, from the tip of the cone⁸ formed by the jelly to the nearest part of the meniscus where air and semen meet. If this is longer than 5.3 mm or shorter than 4.7 mm, the specimen is discarded.

The tube, in a horizontal position, is obliquely illuminated by a 60 candlepower automobile headlight bulb with a small filament, this light is placed close beyond the tube, and about

6a. In November 1952 Dr H Mizuno of Nagoya University, Japan, told the author that he had independently measured and compared spermicidal times under similar conditions. A description in Japanese of his procedure has subsequently been included in the Second Report of the Committee on the Study of Health and Welfare of the Department of Health and Welfare of the Japanese Government, Kyoto, December 1952.

7 For brevity the word jelly will be used to include jellies, creams, suppositories, and other semisolid contraceptive materials.

8 Friction of the walls of the tube as the jelly is forced in usually results in a cone at the end. The angle at the tip varies but is usually about 120°. Variations in this angle may result in variations in the surface of the jelly to which the semen is exposed but these do not appear extreme.

45° from the axis of the microscope. The position of the bulb is varied until the best possible view of the sperms is found. To avoid undue heating, the light is turned on (with a foot-pedal) only during moments of observation. A large opening in the microscope stage is convenient.

Motion of the sperms is observed through a 10x objective and 10x eyepiece. While the specimen is not being examined, it is kept in an incubator at 37 C, approximating vaginal temperature.

Fig. 1—Length of semen column in which motility has been abolished compared with time. The semen columns are 20 mm in length and 2.5, 2, 1.5, 1, and 0.5 mm in diameter. The curves of the larger diameters are averages of four tubes each; that of the smallest of two tubes. All tubes were filled nearly simultaneously with portions of the same ejaculate and contraceptive material.

The period of time is recorded from the addition of the jelly to the immobilization of the last discoverable sperm that is closer to the jelly than the nearest portion of the meniscus, thus, motion within the angular portion of the semen next to the meniscus is disregarded. The contraceptive material that has the shortest immobilization time as thus determined (using portions of the same ejaculate) is presumed to be the most active.

AGE OF THE EJACULATE

As found in the Brown and Gamble test, the spermicidal time decreases as the ejaculate becomes older. For accurate comparisons, therefore, tubes should be filled at approximately the same time as well as with portions of the same ejaculate.

DIAMETER OF THE SEMEN COLUMN

When the jelly was in contact with the semen in the tube, it was found that the zone in which the sperms were immobilized gradually increased in length. When this rate of increase was compared, using the same brand of jelly and identical semen, but different diameters of tubes, it was found that within the limits tested (0.5 mm to 2.5 mm) it was higher in the larger tubes. Results of a typical experiment are given in figure 1. Repeated comparisons of a series of commercial contraceptives showed that their ranking was not significantly altered by changes in the diameter of the tube used.

To reduce the hours needed for observation, a larger tube is desirable, but it makes observation more difficult. To balance these two factors, a tube with a diameter of 2 mm was chosen.

LENGTH OF THE SEMEN COLUMN

The effect of the length of the column of semen on the rate of immobilization was also explored. It was found that the shorter the column the more rapid the immobilization. Results of a typical experiment are given in figure 2. The ranking of contraceptive mixtures was not significantly dependent upon the length of semen column, provided the same length was used for each material.

Although a decrease in the column length has the advantage of shortening the observation period, it results in greater proportioned errors from variations in length. As a balance between these two factors, a length of 5 mm was selected.

LENGTH OF THE JELLY COLUMN

If the column of jelly is too short, the toxic materials might be exhausted too early, leading to a longer immobilization time. However, since diffusion in the noncirculating fluid of the jelly is slow, this would not appear to be an important factor. Tests showed no significant difference in immobilization time between columns of the same jelly that were 3 mm and 10 mm long. However, lengths of approximately 10 mm are customarily employed.

END POINT

The time required for the zone of immobilization to reach any chosen distance from the jelly might be considered to be related to the contraceptive effectiveness of the jelly. Experiments using various distances up to and including the entire length of the column were performed. Results of these tests ranked commercial contraceptive mixtures in approximately the same order as did the other experiments. It was found somewhat easier to determine the time when there were no motile sperms nearer the jelly than the meniscus, consequently this time was chosen for the end point.

Fig. 2—Length of semen column in which motility has been abolished compared with time. The semen columns are 1.6 mm in diameter and 10, 20, 40, 60, and 80 mm long. Each curve is drawn from a single experimental tube filled nearly simultaneously with the others with portions of the same ejaculate and contraceptive material.

POSITION OF THE SEMEN COLUMN

The position of the tube greatly affects the rate of extension of the zone where the sperms are immobilized. No important differences were found between the rates when the tubes were in the customary horizontal position and when they were 45° or 90° from the horizontal with the semen below the jelly. However, when the tubes were placed vertically with the

semen above, immobilization extended less than 1 mm with even the most active jellies after six or seven hours of observation

CONVECTION IN THE SEMEN

A flow of sperms and other seminal particles is observed in most of the tubes placed horizontally. This flow is usually toward the jelly in the higher levels of the semen (nearest the objective with the microscope in the customary position) and away from it when the focus is shifted to the lower levels (A flow in the opposite direction is occasionally observed, at times there is no flow.) The flow appears to be laminar, moving slowly close to the surface, it first increases as the focus is shifted downward, then decreases as the center of the tube is approached. The flow moves more rapidly near the jelly, decreasing toward the other end of the semen column. It often decreases after hours of exposure to the jelly. Difficulties in measuring the depth of the focal plane below the inner surface of the glass have made it impossible to secure accurate comparisons of flows under varying conditions, however, flows as rapid as 1 mm per minute have been observed.

The findings suggest that the flow is caused by convection. Diffusion of solutes out of the jelly usually makes the semen denser, causing it to sink and to be replaced by less contaminated semen. The spread of the spermicidal ingredients by convection is compatible with the greater rate of extension of the immobilized zone within the larger tubes (fig 1), because the lesser surface friction of these tubes would allow more rapid circulation.

The theory of convection in the semen also makes understandable the slower rate of decrease of the zone of motility in the longer semen columns (fig 2). This finding would not be expected if the dissemination resulted from diffusion alone. The entire semen column dilutes the immobilizing materials via circulation, thus delaying their reaching effective concentrations.

This conception also explains the slow spread of immobilization in vertical tubes in which the semen is above the jelly. In this position the lower portions of the semen, made denser by diffusion from the jelly, tend to remain in contact with it, and the toxic materials rise only by the relatively slow process of molecular diffusion. The fact that the immobilization rate is decreased when the semen in the tube is above the jelly would not seem to invalidate the test as an indicator of clinical accomplishment. Cases in which postcoital units of semen are exposed to jelly only on their underside would appear to be extremely rare. All other forms of contact will produce convection.

VARIATIONS IN SEMEN SPECIMENS

When portions of the same ejaculate were utilized in the method described, repeated determinations of spermicidal time showed standard deviations of a single observation of about 12%. In a series of 26 observations using one tube of jelly, with different donors and different ejaculates, the standard deviation of a single measurement was 38% of the average. For the 43 mixtures of 1951 reported in the table, of which all immobilizations were complete before seven hours, the average standard deviation of a single observation was 35% of the corresponding mean. Ejaculates from different donors produced greater variations in test results than the ejaculates from the same donor. The ejaculates from certain donors were consistently above average, whereas those given by others were consistently below average.

While this indicates that several tests with a given material are required to secure an accurate diffusion spermicidal time, single comparisons of two or more preparations tested with the same ejaculate will divide the range of contraceptive mixtures commercially available into a number of groups that are significantly different from each other in spermicidal activity.

SPERMICIDAL RANKING OF SEVENTY COMMERCIAL CONTRACEPTIVES

Semen specimens, secured from eight medical students 21 to 26 years of age, were used to determine the immobilization times of 68 commercial contraceptive preparations secured in 1951 and 2 in 1952. Twenty to 40 materials were compared in each experiment with portions of the same ejaculate, by one or two observers.

The experiments were customarily discontinued after seven hours of exposure of semen to jelly. If motility was still present at this time the distance of the farthest motile sperm from the meniscus at the end of the semen column was recorded. A distance of 5 mm indicates what motion was seen in the space surrounding the cone that forms at the jelly's tip.

Each commercial preparation was tested six or more times (at least twice by each observer) with semen from five or more different donors. In addition, by preparing the capillary tubes in the order of decreasing spermicidal times, materials of approximately equal activity were tested with portions of the same ejaculate which were of about the same age.

The average of all tests made of a given material is recorded in table 1, except for those preparations that showed motility in one or more tests at the end of seven hours. For these the median value is used. If this exceeded seven hours, the length of the semen column still showing motility is also given.

It seems unwise to commend secret mixtures, since there is no assurance that when these materials are secured in the future they will have the same composition as the samples tested. Materials whose complete formulas are not available, and whose immobilization times were less than 253 minutes (the median of the group) are listed in table 1 as materials A, B, C, and D.

The average standard deviation of 35% indicates that differences between two averages of the six or more observations given in table 1 are significant (less than 1 chance in 20 of being accidental) if they differ by more than 40% of their mean.⁹ Since the longest observed times (more than 420 minutes) were more than nine times the shortest (46 minutes), the commercial preparations may be divided into several groups having significantly different spermicidal activities.

For an indication of the reproducibility of the test with different donors, spermicidal times similarly measured in 1950 and 1951, using the 1949 samples of the same materials with known formulas, are given in the third column of the table. Differences in the two average times for the 22 materials of which the formulas were known to be the same are, on the average, 18% of their means.

EXTRAPOLATION TO CLINICAL CONDITIONS

The spermicidal times from one half hour to more than seven hours for complete immobilization in the columns of semen 2 mm in diameter and 5 mm long are obviously not those anticipated in clinical contraception. Experiments showed that these periods of time decreased to a few minutes as shorter semen columns were tested in tubes whose diameters were 2 mm. In the vagina the entire surface of the droplets is presumably exposed to jelly, which should decrease the time still further. The effective surface of the droplets may be increased by distortion from a spherical shape.

Although the immobilization times under clinical conditions will undoubtedly be much shorter than those given in table 1, the uncertainties regarding the size and shape of the droplets of semen in the vagina after coitus make it impossible to estimate these times with any exactness.

COMPARISONS WITH THE BROWN AND GAMBLE SPERMICIDAL TEST

Spermicidal times of the same samples of commercial contraceptive materials which were determined by the Brown and Gamble method are given in table 2. When ranking by this method is compared with that by the diffusion test (table 1), the correlation is not high. In many instances, mixtures that are more effective after dilution and mixing are less active when access to the sperms is by diffusion out of the jelly or cream and by convection throughout the adjacent semen.

Since the direct and undisturbed contact of semen and contraceptive material in the diffusion test more closely imitates clinical conditions than does the Brown and Gamble procedure, it is probable that the diffusion test gives a better

⁹ The relative accuracy of the ranking may be somewhat greater since most of the experiments were arranged to test with the same ejaculate in tubes filled at nearly the same time materials previously found to be adjacent on the scale.

¹⁰ Gelatin and agar each showed moderate immobilizing activity.

indication of the relative clinical effectiveness. A high ranking by both tests will give a "factor of safety," which seems desirable when contraceptive protection is important.

CHEMICAL FORMULAS OF THE MATERIALS TESTED

Each manufacturer was asked for permission to publish the formulas from which the contraceptive mixture was made. The information made available is indicated in table 1. To conserve space the formula is given in the addendum only when it is not available in previous publications. It is to be regretted that 26% are secret mixtures.

A SIMPLE CONTRACEPTIVE JELLY

The apparent convection resulting from increased density of the semen adjacent to the jelly suggested that the circulation of the spermicidal ingredients within the semen might be accelerated by adding a density producing solute to a jelly. Therefore, sodium chloride was incorporated (with mortar and pestle) in one of the less rapidly immobilizing materials and was found to greatly increase its apparent activity.

* Each time is the median of 5 or more determinations with semen from five different donors.

Because Vogt³ found that 3.4% sodium chloride in a semen mixture immobilized in 10 minutes, it seemed that the action might be caused by this salt's activity. Therefore, various concentrations were added to a 5% tragacanth jelly, a mixture which by itself was found to have little or no immobilizing power.¹⁰ A concentration of 10% sodium chloride in 5% tragacanth was found to immobilize the spermatozoa as well as did nine-tenths of the commercial contraceptives.

The possibility of preparing a homemade spermicidal jelly from a readily obtainable material was investigated. It was found that rice flour and water heated nearly to boiling for 30 minutes in a double boiler, with stirring, produced a jelly with a consistency approximating that of commercial contraceptives when the initial concentration was between 12 and 17% of the water by weight. Wheat and other flours, gelatin, and other jelly producing substances may also be used, rice flour was chosen for the test with the thought that it would be widely available in countries in which population control is intensely needed.

The immobilizing activities of jellies containing sodium chloride in a concentration of 0.1, 0.2, and 0.3 of the water by weight were tested and found to be among the more active commercial products (table 1)

Such rice flour and salt jellies in which the sodium chloride was 10 and 20% of the water were tested at the Margaret Sanger Research Bureau by three women. Daily vaginal doses of 5 cc each for 21 days did not cause subjective discomfort or evidence of irritation upon speculum examination

When the rice flour jelly was kept at room temperature in the laboratory, it usually turned sour in a few days. A jelly made with three times the recommended concentration of rice flour and salt has been found to last weeks at room temperature and to give a satisfactory consistency when diluted with twice its volume of cold water. Stirring for 3 or 4 minutes, followed by a lapse of 15 or more minutes and a slight amount of further stirring, was found to be desirable

It seems probable that a solution of sodium chloride, of 10% or stronger, will act as an effective spermicide. A rubber or marine sponge, a wad of cotton, or a pad of cloth can hold it in the vagina. It should be inserted before intercourse and retained for a sufficient period thereafter to allow immobilization of the sperm

SUMMARY

Clinical tests of contraceptive materials are unsatisfactory because of variations in the regularity of their use. Most laboratory tests which have been used to give indications of clinical effectiveness have been based on dilution and complete mixing, neither of which is present to the same extent in clinical use. A method is described for observing the immobilization of sperm in semen in direct contact with undiluted contraceptive jelly, cream, or suppository. Using the test with semen columns 2 mm in diameter and 5 mm long commercial contraceptive preparations have been compared and their rankings are given. It is concluded that density convection within the semen caused by diffusion into it of ingredients of the contraceptive jelly, is an important process in contraceptive action. A jelly having high spermicidal activity by this test was prepared by heating and stirring together sodium chloride, rice flour, and water

ADDENDUM

1 Complete quantitative formulas were supplied by the manufacturers for the following products

	%		%
Bilco Jelly 1951		Propyl p-hydroxybenzoate	0.05

THE POSTCOITAL TEST AS A METHOD OF EVALUATING A CONTRACEPTIVE JELLY

Melvin R. Cohen, M.D.

and

Bernard M. Kaye, M.D., Chicago

In the past 20 years, several birth control studies have been made at Mandel Clinic of Michael Reese Hospital, utilizing jelly alone as a contraceptive measure. In 1932 Stein¹ conducted such a study lasting three years, and during the course of the active clinic no pregnancies occurred among the 146 patients in that particular series. Ten years later, Stein, Nielsen, and one of us (M. R. C.)² reported on another three year study using the jelly alone. This survey included 231 patients who were interviewed in the clinic over a period lasting from 3 to 36 months. A total of 20 pregnancies could be charged solely to the method utilized in this second series. This study showed that the effectiveness of the method using jelly alone to be an 87.1% reduction in fertility. Since 1942 several reports have been made on the efficiency of the nonmechanical means of contraception, including jelly, cream, and suppositories. The authors of these articles reported that the use of these methods resulted in 85 to 100% reduction in fertility.³ From a review of the literature of the past 20 years and from our own experience, it is apparent that nonmechanical means can be effective as contraceptive methods.

In the present survey, we utilized what we consider a more scientific and reliable method for testing the efficacy of a specific contraceptive jelly than has been used in former studies. This method is the postcoital examination made after the use of the contraceptive. We feel that this is an effective means of evaluation since spermicidal action was tested at that period of the menstrual cycle when cervical mucus demonstrated greatest receptivity to spermatozoa. The pregnancies that can be charged against a contraceptive per se, eliminating all other factors, can be better estimated by the positive postcoital tests.

The purpose of this study was threefold: (1) to utilize a heretofore untried objective method of evaluating the effect of an experimental jelly on the longevity of spermatozoa, (2) to determine the effect of this jelly upon cervical mucus, and (3) to evaluate this experimental jelly as a contraceptive.*

In our special birth control clinic, 200 patients were instructed in the method using jelly alone. Of these, 158 patients returned to the clinic for at least one visit over a period of 3

to 18 months. The clientele consisted chiefly of postnatal patients and certain women referred because of medical indications. The group consisted of 95% Negro and 5% white women. Thirty-seven patients had used various birth control measures previously. The chief methods employed were diaphragm and jelly (18 patients) and condom (14 patients). Of these patients 9 and 12 respectively stated that the methods had been successful but had been discontinued for personal reasons.

CLINICAL DATA

The patients were interviewed and examined gynecologically before birth control instruction was given. In addition to past medical, surgical, and obstetric history, an inquiry was made regarding previous contraceptive methods and sex habits. A calendar card was issued to each patient with instructions to mark the dates of menses and of coitus. A symbol was to be placed over the date of intercourse, indicating the date on which the clinic contraceptive was used. If no contraceptive was used, the date was to be circled. Each patient was individually instructed in the proper technique as follows: A 5 cc. applicator was to be filled completely with the jelly, inserted into the vagina as high as possible, withdrawn about 1 inch., and the plunger pushed in all the way so as to place the jelly in the upper vagina, close to the cervix. Each patient was cautioned to insert the jelly while lying in a horizontal position, 5 to 10 minutes prior to each coitus. An optional douche was permitted after a minimum of six hours following coitus. Patients were seen within a week after instruction. Whenever possible, the examination was made a few hours after coitus. Examination at this time and at subsequent one to three month intervals included pelvic examination, with particular attention to the study of vaginal and cervical contents. A vaginal speculum was inserted without lubrication, exposing the cervix and the posterior fornix. A small quantity of the vaginal secretion from the posterior fornix was diluted with saline and the smear of this material examined for spermatozoa, leukocytes, trichomonads, and monilia. The cervical mucus at the external os was removed with tissue forceps. After the cervical mucus was removed, a curved glass cannula was inserted into the cervix for aspiration of the endocervical contents. Occasionally, intra uterine samples were aspirated. The cervical mucus was studied macroscopically as to the amount (1 to 4+), viscosity (thin, moderate, or thick), fibrosity (*Spinnbarkeit*), and flow elasticity. The same specimens were examined microscopically for spermatozoa and leukocytes.

Spinnbarkeit,⁴ which is the capacity of the cervical mucus to be drawn into a thread, shows cyclic variations during the menstrual cycle. At the estimated ovulation time, the cervical mucus becomes thin, profuse, glairy, and will show the greatest degree of *Spinnbarkeit* (usually 10 to 20 cm in length). At this phase of maximum *Spinnbarkeit*, the longevity of spermatozoa is optimal. It is at this time that a contraceptive must be most effective. Therefore, we attempted to test the efficacy of Experimental Jelly 'P' at the estimated ovulation time, utilizing *Spinnbarkeit* and the menstrual calendar as the criteria of ovulation.

RESULTS

A total of 289 postcoital tests was performed on the 158 patients. These tests were done 2 to 72 hours postcoitus. Of the 289 postcoital tests, 173 (59.8%) revealed no sperm, 110 (38.1%) examinations showed nonmotile sperm, and motile sperm were found in only 6 (2.1%) examinations (table 1). These positive findings occurred in 5 women, twice in the same patient. Three women stated that they had not followed the exact instructions regarding the technique.

The mucus obtained at the external os after the use of Experimental Jelly 'P' was almost invariably thick and plastic and showed a *Spinnbarkeit* of 1 cm or less. These physical characteristics of cervical mucus are inimical to sperm motility. However, when this thickened mucus was removed with tissue forceps and the endocervix aspirated, the endocervical mucus was found to be consistently characteristic of the phase of the cycle at which it was obtained. In other words, if the jelly itself produced mucus coagulation, this effect was in the zone of contact and did not penetrate to the endocervix.

A total of 200 patients, chiefly postnatal, were instructed in the method using jelly alone. Of the total, 158 patients returned for 1 to 12 follow up visits. In this group, 30 pregnancies occurred. However, 23 of this group of 30 women admitted to omission of the method, incorrect or inconstant use, or the use of some other contraceptive technique. Eighty three women were followed for a period extending from 3 to 18 months. Eighteen of these 83 women became pregnant. Of the 18, 3 omitted contraception, 3 admitted to inconstant use of the jelly, 3 failed to follow instructions properly, and 2 switched to another method. Thus, there were 7 pregnancies which might be attributed to failure of the method (table 2).

In computing the pregnancy rate, only those patients who had been followed for at least three months were included. Some patients were seen for the first time shortly before termination of the clinic and others only on their check up visit one week after instruction. Therefore, the pregnancy rate was computed on the basis of 7 pregnancies out of the group of 83 women who were followed at least three months. The gross pregnancy rate of this group before admission to the clinic was high: 103.15 pregnancies per 100 woman years of exposure. The corrected rate of jelly failure was 17.46 pregnancies for 100 woman years of exposure. Therefore, for the method using jelly alone, the reduction in fertility was 83.17%.

Many patients objected to the messiness of the method. Only rarely did they complain of diminished erotic reactions.

COMMENT

The effectiveness of any contraceptive measure depends upon its spermicidal qualities and regularity of use. Through ignorance and the caprice of human nature, any group of patients, private or clinical, will present a certain percentage of failures. Previous clinical studies have shown fairly high percentages of pregnancies with relatively few actually resulting from failure of the method itself. The corrected figures for our clinic compare favorably to those published by Stein,^{2b} and Finkelstein.^{3b} However, the results of our study are not as favorable as those reported by two other groups of investigators who used Preceptin[†] in their clinics.^{31,1}

The effectiveness of accepted spermicides in general use has been tested repeatedly *in vitro*. In this study, the use of an experimental jelly tested *in vivo* has been reported. The effectiveness *in vivo* of the jelly can be evaluated by examining vaginal and cervical secretions for living spermatozoa following coitus. In utilizing the postcoital test, we hoped to determine whether the failures resulted from the actual failure of the method as a spermicide or to the human element of possible omission or misapplication of the method.

TABLE 1—Positive Postcoital Tests Following Use of Experimental Jelly 'P'

* External os of cervix † Endocervical canal

Side-Effects—The chief complaint against the contraceptive jelly was that of burning during and after its use. A total of 49 persons complained of local burning with the use of the jelly, this included both male and female. Some of these complaints were made by only one partner, in some instances, both partners complained. Twelve women who reported this symptom were found to have monilial vaginitis, when this was

Since the postcoital method is a sampling technique, it is liable to error. There was an incidence of 2.1% positive postcoital tests (motile sperm) in a total of 289 examinations. It is possible that living sperm were present in other cases but were not found by the sampling technique.

SUMMARY

The effectiveness of the method using jelly alone compares favorably with the results published by other investigators who studied similar methods. Experimental Jelly 'P' was employed in a group of 158 clinic patients. An 83.17% reduction in fertility resulted. However, acceptance of the method by the patients was poor, less than one half of the women were reporting to the clinic at the time the study terminated.

Experimental Jelly 'P' showed only a superficial coagulating effect upon cervical mucus, and there was no evidence of penetration into the cervical canal.

What was considered a more scientific and reliable method for testing the efficacy of a spermicidal jelly was tried: the *in vivo* examination of cervical contents following the use of a specific contraceptive. At the conclusion of this study, we were satisfied that the postcoital test is accurate and should be utilized more widely in the evaluation of spermicidal preparations used as contraceptives.

TABLE 2—Causes and Number of Pregnancies

Causes	Number of Pregnancies
Jelly failures	7
Failure to use jelly as directed	3
Inconstant use of jelly	8
Condom failure	2
Omission of all birth control	10
Total	30

treated, the complaint of burning ceased. In 5 patients, monilia-like organisms were found in the absence of any complaints. Some patients reported burning when the jelly was first used, but stated that with continued use the burning sensation disappeared. Because of these side-effects, the formula of Experimental Jelly 'P' has been changed to incorporate a new buffer system.

† Preceptin has a different buffer system than Experimental Jelly 'P'.

MEDICAL EDUCATION FOUNDATION REPORTS PROGRESS

The recently published second annual report of the American Medical Education Foundation indicates that 16% of the medical profession in the United States contributed more than 3 million dollars to medical education during 1952. The report clearly shows the medical profession's growing acceptance of the Foundation's fledgling program and the determination of the profession to assist the nation's medical schools in their fight to attain financial solvency. Notable interest in the Foundation's program during 1952 was evidenced by a 287% increase in the number of contributors, from 1,876 in 1951 to 7,259 in 1952. Contributions by individuals to the Foundation during 1952 amounted to \$291,000, a 210% increase over 1951, and total contributions amounted to \$906,553.

With the cooperation of the medical schools, the Foundation's report lists, for the first time, the names of 30,808 individual physicians who made unrestricted gifts directly to the medical schools last year. Names are listed alphabetically by state of residence, and the school receiving the contribution can be identified easily by a code number following each physician's name. Direct gifts to medical schools by physicians in support of teaching programs during 1952 totaled approximately \$2,250,000.

According to the report, strong support of the Foundation was found particularly in eight states in which 15% or more of the physicians made contributions. Nebraska led all states, with a total of 27.93% of her physician population contributing to the Foundation. Indiana, South Dakota, Vermont, Wyoming, New Hampshire, Connecticut, and Delaware, in that order, were the other leaders in the group of eight. While these percentages seem impressive at first glance, the over-all picture is still far short of the optimum support needed from members of the medical profession to relieve the financial strain under which our medical schools operate today.

The medical schools are among the nation's greatest bulwarks for freedom, but they are heavily dependent upon physicians for support. Without the individual support of every member of the medical profession, the

schools will be forced to lower the quality of teaching programs, which ultimately will result in poorly trained physicians. Inadequately trained physicians will mean inadequate medical service for the American public.

Every physician in the United States should read the second annual report of the American Medical Education Foundation and make a careful survey of his or her charitable contributions and include the Foundation. A more worth-while cause than that of keeping the nation's medical schools operating at current high standards cannot be found. Recently President Eisenhower said, "Only if our medical schools remain financially solvent can we hope to place medical education on a sound basis, free from the threat of government-sponsored plans or schemes to control it."

The American Medical Education Foundation is a "physician's foundation," organized for the benefit of the medical schools that will supply future members to the profession. It deserves the wholehearted support of every physician in the United States. Individual members of the profession who have worked on committees at personal sacrifice for the Foundation's program during the last two years are to be commended for their successful efforts to help alleviate the financial strain in medical education today. If this group of busy, practicing physicians can take time from their leisure hours to do the arduous committee work connected with the development of the Foundation, all members of the medical profession can and should help by making a gift to the Foundation. Physicians may make a contribution earmarked for the school of their choice or to the general fund. No matter which method is chosen, it will help the Foundation attain its annual goal of 2 million dollars and help insure the continued freedom and solvency of the medical schools.

MISTREATED CHILDREN

From time to time pictures appear in newspapers showing children who have been treated inhumanely by their parents. In a newspaper with a large circulation through much of the United States there recently was published a photograph of a 12-year-old boy with a chain around his neck. He had been chained to a chair by his father because he displeased this parent.

Such public display of children is not uncommon. Obviously it is newsworthy and may, of course, arouse local indignation so that punishment befitting the crime is effected. It does not, however, help the unfortunate victims. If a child is guilty of an offense against society he must expect to receive some punishment. If, on the other hand, he is subjected to mistreatment, especially if it is not his fault, he should not be exposed deliberately to the ridicule, taunts, and even well meant but cutting sympathy that follows his being placed before the spotlight of publicity. A report of the story is one thing, but an accompanying picture by which the child can be

identified even by strangers is another. If he is a normal child his life may well be profoundly affected by such bids for the attention of a news-hungry public.

Anyone who has worked with children in camps, clubs, or schools will know of the sensitive responses often observed in boys and girls. There are few children who do not feel deeply hurt when they believe they have been betrayed by their parents or, for that matter, by their teachers and group leaders. They are especially troubled when this betrayal means they are held up to ridicule. Sometimes the hurt is controlled without harm to anyone, but too often it results in spiritual and even physical rebellion that leads to serious trouble.

The social and psychiatric aspects of this type of commercial exploitation of children can best be discussed by those who are experts in such fields. Physicians in general, however, work closely with children, not just in their practices but in other activities sponsored by clubs, churches, youth organizations, and schools. From time to time they have encountered situations in which they have longed for the opportunity to prevent some children from being ridiculed publicly. They know that it is much easier to prevent deep resentment than to attempt to correct the results of it. They also know, perhaps better than others, the need for careful counseling as boys and girls are passing through their formative and most impressionable years. Perhaps a few words from doctors addressed quietly to responsible persons may prevent at least occasionally the unnecessary public display and exploitation of some boy or girl whose only crime is to have the wrong parents.

MEDICAL HELP FOR INDIA

During the recent convention of the American Medical Association the Board of Trustees endorsed a joint project of CARE and the World Health Organization to provide needed equipment and supplies to India and neighboring countries. The Trustees' action was followed by one by the Woman's Auxiliary, which adopted a resolution that also pointed up the need for such improved medical services. The project offered by CARE and the World Health Organization is based on a recent WHO survey that established that in India alone there are some 80 hospitals, medical schools, nursing schools, and similar institutions, and 210 more in neighboring countries, with a total of some 42,000 beds, which are in urgent need of the most basic supplies, including bed linen, surgical instruments, simple laboratory equipment, and textbooks on materia medica, pathology, latest surgical and treatment techniques, and similar subjects. A hospital for patients with tuberculosis in Ceylon, for instance, was found to be lacking sterilization equipment for instruments and utensils and for the notoriously bad drinking water of the community. Two natives were kept busy boiling water all day to meet the need. A nursing school in India was providing all of its instruction with the aid of a single anatomic atlas, dog-eared with age, its

request was for books, "just one textbook each on public health, nursing techniques, therapeutical methods, etc." The Ramakrishna Hospital in East Rangoon, which treated more than 76,000 patients last year, not counting patients readmitted, has 16 physicians on its staff, only 4 of whom, the residents and interns, are paid. The other 12 serve gratuitously at the hospital and help make up the constant deficit of the institution with the income from their private practice.

The individual physician of India, Burma, and Thailand often is lacking in health tools which the abject poverty of his country prevents him from obtaining. Where large portions of any population are subjected to constant hunger and want, the health standards of a nation are bound to suffer, not merely as the result of general malnutrition, but because of the lowered resistance to all forms of disease, whether epidemic or endemic in nature. Help in such instances is especially appreciated and of almost incalculable value.

USE OF THE METRIC SYSTEM

The scientific publications of the American Medical Association for some years have favored the use of the metric system. The Council on Pharmacy and Chemistry uses only this system for its books, and for *THE JOURNAL*, the metric system is preferred. The advantages of using the metric system are many and have been mentioned in earlier issues of *THE JOURNAL*. These advantages accrue to the medical profession, pharmacy, the drug industry, and to the patient.

The United States Pharmacopeia and the National Formulary, which are official compendiums for the United States, give preference to the metric system. Only in the United States, Canada, and Great Britain is the apothecary system used extensively. And even in the United States it is being used less each year because of the teaching in medical schools and because the drug industry is labeling its newer products with metric weights and measurements. Thus it seems to be only a matter of time before the apothecary system is largely discarded in this country.

This progress should be encouraged for practical reasons, which include those associated with economics and with safety in prescribing. According to a survey made by *Drug Topics*, a journal primarily of interest to pharmacists and the drug industry, more than 68% of physicians and pharmacists desire increased use of the metric system. Unfortunately, some of the pharmacists believed this system was not growing in favor. Others, however, asserted it was being used more extensively and referred particularly to increased use by general practitioners. The survey revealed at least some reason for hoping that the day when the metric system will be exclusively used is closer, but it also indicated a real need for those in favor of this more scientific and exact system to use every means to encourage its general adoption. It may take time, but it will be worth the effort.

ORGANIZATION SECTION

COMMITTEE ON LEGISLATION

At its meeting April 3-4, 1953, the Committee on Legislation took action on 75 legislative measures introduced in the 83rd Congress, recommending either approval or disapproval. All of the recommendations were approved by the Executive Committee of the Board of Trustees on April 26, 1953. Following is a brief résumé of these bills grouped according to subjects, together with the position adopted by the Association in each instance.

MEMBERS OF THE ARMED SERVICES OR THEIR DEPENDENTS

S 33

Introduced by Mr. McCarran of Nevada and referred to the Senate Committee on Armed Services.

Digest of Bill—The bill would authorize hospitalization and medical and dental care for members of the Coast Guard and their dependents in United States Naval hospitals and dispensaries when such care is not available from the United States Public Health Service.

Association Position—The Association actively opposes the bill, because, in its opinion, medical care and hospitalization is now being furnished to dependents of service personnel without clear-cut congressional authority. The Army, Navy, and Air Force are currently furnishing medical care for dependents of service personnel on the basis of an act passed on July 5, 1884, providing, in part, that "medical officers of the Army and contract surgeons shall, wherever practicable, attend the families of the officers and soldiers free of charge."

The wholesale extension of such care as a matter of convenience and without regard to the availability of adequate civilian personnel and facilities is necessitating the induction of increased numbers of physicians into the armed services. In addition, the expansion and new construction of military medical installations to care for such dependents is an unauthorized and unnecessary expenditure of funds.

S 932 (similar bills H R 2724 and H R 3160)

Introduced by Mr. Hunt of Wyoming and Mr. Hendrickson of New Jersey and referred to the Senate Committee on Armed Services.

Digest of Bills—These bills would amend the Officer Personnel Act of 1947 (Public Law 381, 80th Congress) so as to permit the commissioning of veterinarians as first lieutenants rather than as second lieutenants.

Association Position—The Association actively approves these bills. The position of the Association was motivated by a change in the educational standards adopted by schools of veterinary medicine since 1949. From 1935 to 1947 veterinarians were commissioned as first lieutenants right out of school. Because the schools of veterinary medicine required a minimum of only one year of preveterinary college training for admission in 1947, instead of the two required by dental and medical schools, the entrance grade for veterinarians entering the armed services immediately after graduation was set at second lieutenant, by the Officer Personnel Act of 1947.

Since 1949, all schools of veterinary medicine have required two years of preveterinary college training as a minimum. A recent survey reveals that in actuality over half of the students admitted have three and four years of college when admitted.

S 1531

Introduced by Mr. Saltonstall of Massachusetts and referred to the Senate Committee on Armed Services.

Digest of Bill—This bill would reenact the language of Public Law 779, 81st Congress, as amended, with some changes and extend the effective date of that Act until July 1, 1955. The bill would retain the four priority classifications contained in existing law, and would, in addition, make the following provisions:

1 Credit would be given for service between Sept. 16, 1940, and Sept. 2, 1945, in the armed services of any country allied with the United States during World War II.

2 Physicians with 12 or more months of service since June 25, 1950, would be excluded from liability for registration and for further service.

3 Authorization would be granted for the appointment or commissioning of medical officers in grades "commensurate with professional education, experience or ability."

4 The reserve commissions of all physicians taken into the service by operation of the law would be terminated on completion of 24 months of service.

Association Position—The Association concurs in a one year extension of the "Doctor-Draft Law" but recommends a variety of amendments to the bill. For a complete statement in this regard see the testimony presented by the Association to the Armed Services Committee of the House of Representatives on April 24, 1953, relative to an identical bill, H R 4495, 83rd Congress (THE JOURNAL, May 9, 1953, page 166).

H R 2452

Introduced by Mr. Boggs of Louisiana and referred to the House of Representatives Committee on Armed Services.

Digest of Bill—The bill would entitle retired enlisted personnel of the Army, Navy, Marine Corps, and Coast Guard, including members of the Fleet Reserve and Fleet Marine Reserve, to receive dispensary treatment in any Army or Navy hospital. The same personnel would be permitted to have hospital care and subsistence when accommodations are available.

Association Position—The Association actively opposes this bill. This bill would merely enlarge the ever-growing number of persons eligible for federal medical care.

H R 2756

Introduced by Mr. Seely-Brown of Connecticut and referred to the House of Representatives Committee on Armed Services.

Digest of Bill—The bill would authorize hospitalization and medical, surgical, and dental care for members of the Coast Guard and their dependents in hospitals and dispensaries operated by the armed forces at places outside the Continental United States and at other places where hospitals operated by the United States Public Health Service are not available. This care would be available when the Coast Guard is operating in the Treasury Department.

Association Position—The Association actively opposes the bill for the same reasons as indicated under S 33 above. The Association would qualify its opposition to this bill insofar as care for dependents outside of the United States is concerned. It is recognized that care should be provided by the armed forces to dependents overseas and where civilian medical personnel and facilities are unavailable or inadequate.

H R 2955

Introduced by Mr. Judd of Minnesota and referred to the House of Representatives Committee on Armed Services.

Digest of Bill—The bill would amend the "Doctor Draft Law" to allow credit for time spent in the armed services during World War II before as well as subsequent to Navy V-12 training or Army Specialized Training.

Association Position—The Association actively approves the bill in the belief that it would remove many of the inequities created by the definitions of priority 1 and 2 classifications now contained in Public Law 779, 81st Congress, as amended. At the present time physicians with service as enlisted men prior to participation in a Navy V-12 or Army Specialized Training program are not given credit for such service. The bill would change the priority classification of physicians in priorities 1 and 2 with more than 21 months of total service to priority 4.

MEDICAL RESEARCH AND ESTABLISHMENT OF MEDICAL FOUNDATIONS

S 156

Introduced by Mr Langer of North Dakota and referred to the Senate Committee on Labor and Public Welfare

Digest of Bill—The bill would authorize the establishment of a National Epilepsy Institute in the United States Public Health Service. The functions of this institute, under the supervision of the Surgeon General of the United States Public Health Service, would be to conduct, promote, coordinate, and assist in research and experiments and to compile and disseminate information relating to the cause, prevention, methods of diagnosis, and treatment of epilepsy.

Association Position—The Association actively opposes this bill because there are already existing agencies for such a program under the supervision of the Surgeon General of the United States Public Health Service.

S 188 (identical bills. H R 583, H R 2253 and H R 2693)

Introduced by Mr Neely of West Virginia and referred to the Senate Committee on Labor and Public Welfare

Digest of Bills—The bills would authorize the President to mobilize a group of outstanding experts and to coordinate and use their services in an effort to discover means of curing and preventing cancer. An initial appropriation in the amount of \$100,000,000 would be authorized by these bills for this program.

Association Position—The Association actively opposes these bills, because it believes that the system proposed would be ineffective in discovering a cure for cancer. A large part of the funds and research efforts of individuals, private institutions, and government agencies is now being directed to the detection of the causes of and a cure for cancer. It does not appear, therefore, that the creation of a new governmental research agency in this field would expedite the accomplishment of the desired results.

H R 258

Introduced by Mr Elliott of Alabama and referred to the House of Representatives Committee on Interstate and Foreign Commerce

Digest of Bill—The bill would authorize an annual appropriation of \$7,500,000 for research in connection with child life. The funds appropriated would be administered federally or through grants in aid to universities, individuals, or public or nonprofit institutions. Research authorized would include the establishment and maintenance of fellowships and the construction, acquisition, leasing, equipping, and maintaining of facilities and necessary services.

Association Position—The Association actively opposes this bill in the interest of economy and inasmuch as the Children's Bureau already has the authority to do such research work.

H R. 2290

Introduced by Mr Morrison of Louisiana and referred to the House of Representatives Committee on Interstate and Foreign Commerce

Digest of Bill—The bill would amend the Public Health Service Act to authorize the establishment of an institute for research on poliomyelitis in the United States Public Health Service. An appropriation of 5 million dollars would be authorized by the bill for this institute.

Association Position—The Association actively opposes this bill because there are already existing agencies for such a program under the supervision of the Surgeon General of the United States Public Health Service.

VETERANS AND VETERANS ADMINISTRATION

S 370 (identical bills H R 28 and H R 261, similar to H R 2001)

Introduced by Mr Murray of Montana and referred to the Senate Committee on Labor and Public Welfare

Digest of Bills—The bills would authorize the construction of additional hospital facilities by the Administrator of Veterans' Affairs to provide the 16,000 beds for which authoriza-

tion was dropped in the budget estimate for the fiscal year 1950. The bills would also authorize the Administrator of Veterans' Affairs, with the approval of the President, to make changes in the location, size, and type of facilities in the program heretofore approved.

Association Position—In view of the facts contained in the report of the Special Committee on Federal Medical Services submitted in December, 1952, the Association actively opposes these bills.

S 609 (identical bills H R 25 and H R 1573)

Introduced by Mr Sparkman of Alabama and referred to the Senate Committee on Finance

Digest of Bills—The bills would amend Veterans Regulation Numbered 1 (a) as amended, to establish a presumption of service-connection for chronic and tropical diseases developing to a degree of 10% or more within three years after separation from active service, notwithstanding the fact that there is no record of such disease during active service.

Association Position—The Association feels that these bills are too general and do not define the terms "chronic" and "tropical diseases." In addition, the bills represent another effort to further liberalize existing Veterans Administration regulations regarding the presumption of service connection. The continuation of such a policy of liberalization will not only result in a distortion of the theory on which compensation benefits are based but will also result in the extension of hospitalization and medical care benefits to veterans with disabilities that are in actuality not service-connected, regardless of their ability to pay for such care from private sources. The Association therefore actively opposes these bills.

S 762 (identical bill H R 33)

Introduced by Mr Martin of Pennsylvania and referred to the Senate Committee on Finance

Digest of Bills—The bills would amend Veterans Regulation Numbered 1 (a) to establish a rebuttable presumption of service connection for active tuberculosis, psychosis, and multiple sclerosis that develops to a 10% or more degree of disability within three years after separation from active service.

Association Position—The Association actively opposes these bills for the reasons stated under S 609 et al.

H R 35 (identical bill H R 1543)

Introduced by Mrs Rogers of Massachusetts and referred to the House of Representatives Committee on Veterans Affairs

Digest of Bills—The bills would amend Veterans Regulation Numbered 6 (a), as amended, to authorize the Administrator of Veterans' Affairs to supply hospital care and medical treatment to veterans who are citizens of the United States visiting or residing abroad for disabilities incurred in service.

Association Position—The Association supports the principle of providing care for veterans with service-connected disabilities, but opposes these bills as drafted because they are too vague and may possibly authorize the construction of Veterans Administration hospitals overseas.

H R 45

Introduced by Mrs Rogers of Massachusetts and referred to the House of Representatives Committee on Veterans Affairs

Digest of Bill—The bill would establish a rebuttable presumption of a service incurred or aggravated disability in case of malignant tumors that develop to a 10% or more degree of disability within two years after separation from active service.

Association Position—This bill sets up an arbitrary rule that the Association feels is not medically sound. The Association actively opposes the bill for this reason and for those listed under S 609 et al.

H R 46 (similar bills H R 310 and H R 2097)

Introduced by Mrs Rogers of Massachusetts and referred to the House of Representatives Committee on Veterans Affairs

Digest of Bills—The bills would amend Veterans Regulation No 1 (a) to establish a rebuttable presumption of service-connection for wartime veterans developing tuberculosis other

than pulmonary within three years after separation from active service

Association Position—The Association actively opposes these bills for reasons indicated for H R 45 above and S 609 et al

H R 54

Introduced by Mrs Rogers of Massachusetts and referred to the House of Representatives Committee on Veterans Affairs

Digest of Bill—The bill would authorize the appointment of doctors of chiropractic in the Department of Medicine and Surgery of the Veterans Administration To be appointed such a person must hold a degree of doctor of chiropractic from a school or college approved by the Administrator, be licensed to practice in one of the states or Territories or the District of Columbia, and have practiced chiropractic for at least two years

Association Position—The Association actively opposes this bill

H R 338

Introduced by Mrs Rogers of Massachusetts and referred to the House of Representatives Committee on Veterans Affairs

Digest of Bill—The bill would amend Veterans Regulation Numbered 7 (a) to authorize the Administrator of Veterans' Affairs, within the limits of existing facilities over which the Veterans Administration has direct and exclusive jurisdiction, to furnish outpatient medical, dental, and surgical treatment for non service-connected disabilities to any veteran eligible for hospitalization if he is in receipt of or entitled to compensation for a 100% disability or pension for permanent and total disability Such outpatient care is contingent upon the fact that such care is medically feasible and less costly than hospitalization by the Veterans Administration

Association Position—The Association actively opposes this bill, in view of the facts contained in the report of the Special Committee on Federal Medical Services submitted in December, 1952 The provision of outpatient care for individuals with non service-connected disabilities would greatly extend the responsibility of the government for this type of disability

H R 1414

Introduced by Mrs Rogers of Massachusetts and referred to the House of Representatives Committee on Veterans' Affairs

Digest of Bill—The bill would authorize the Administrator of Veterans' Affairs and the secretaries of the Army, Navy and Air Force, with the approval of the President and the Secretary of Defense, to transfer hospitals, facilities, equipment, etc., between the Veterans Administration and the Armed Services

Association Position—The Association approves this bill It is felt that in providing federal medical and hospital services there should be an allocation of beds and hospitals in an effort to attain the greatest economy It is not now possible for the Department of Defense to take over Veterans Administration hospitals without a transfer of funds

H R 2573

Introduced by Mrs Rogers of Massachusetts and referred to the House of Representatives Committee on Veterans' Affairs

Digest of Bill—The bill would amend Public Law 62, 76th Congress, as amended, to provide that veterans of the Spanish-American War, including the Boxer Rebellion and the Philippine Insurrection, who are in need of outpatient treatment, shall for the purposes of such treatment or for emergency hospital care, be deemed to have a service-connected disease or disability

Association Position—The Association actively opposes this bill because it is not medically sound and would distort completely the theory on which compensation and service connected medical care and hospitalization benefits are based It is believed that if such a precedent were established, eventually benefits of this type would be extended to other veterans, which would make a large part of the population eligible for such medical care

H R 2980

Introduced by Mrs Rogers of Massachusetts and referred to the House of Representatives Committee on Veterans Affairs.

Digest of Bill—The bill would authorize and direct the Chief Medical Director of the Veterans Administration to make available to all veterans entitled to outpatient eye care the services of qualified optometrists

Association Position—The Association opposes the bill because (1) it would compel the Chief Medical Director of the Veterans Administration to make available a particular type of service even though in his professional judgment it was not suitable in a particular case, (2) there can be no reliable evidence presented that veterans now are denied any eye care that the enactment of this bill would make available, (3) the training that an optometrist receives does not qualify him to give the veteran suffering from a visual disturbance 'proper eye care, and the optometrist is not authorized by law to use medication or to employ surgery, and (4) the services of optometrists are now made available to veterans on request in certain cases in which an examination by a qualified ophthalmologist fails to disclose the existence of a cause of visual abnormality unrelated to lens power

H R 3070

Introduced by Mr Frelinghuysen of New Jersey and referred to the House of Representatives Committee on Veterans' Affairs

Digest of Bill—The bill would amend Veterans Regulation No 1 (a) to establish a presumption of service-connection for war-time veterans in whom amyotrophic lateral sclerosis develops to a degree of 10% or more within two years after separation from active service

Association Position—The Association actively opposes this bill for the reasons outlined under S 609 et al

FEDERAL AID TO EDUCATION

S 461

Introduced by Mr Humphrey of Minnesota and referred to the Senate Committee on Labor and Public Welfare

Digest of Bill—The bill would amend the Public Health Service Act to provide grants-in aid and federal scholarships for postgraduate education in the field of public health The bill would authorize annual appropriations to enable the Surgeon General of the United States Public Health Service to meet the basic operating costs of graduate instruction in schools of public health, for grants for the construction and equipping of new schools of public health, and for the expansion of existing facilities In addition, sums would be authorized annually for five years for scholarships in public health training (including hospital administration)

Association Position—The Association actively opposes this bill for the same reasons as for S 337, 82nd Congress (federal aid to medical education) It is the belief of the Association that under such a system an objectionable degree of federal control would be inevitable The bill would create an opportunity for the exercise of political pressure and intervention and would jeopardize the academic freedom of medical schools

H R 250

Introduced by Mr Elliott of Alabama and referred to the House of Representatives Committee on Education and Labor

Digest of Bill—The bill would authorize federal grants to states on a 50 50 matching basis to help finance health and safety instruction and physical education for children of school age States must have approved plans that provide (1) for a program to improve health and safety instruction and physical education in local schools, (2) that the state treasurer be the custodian of the funds, (3) for an equitable apportionment of funds for different racial groups, (4) for administration and supervision of plans by the state administrative agency, and (5) for periodic reports

Association Position—The Association actively opposes this bill because it (1) deals with a state and local problem and (2) provides for an unnecessary expenditure of funds.

H R 2718

Introduced by Mr Heller of New York and referred to the House of Representatives Committee on Interstate and Foreign Commerce

Digest of Bill—The bill would authorize the creation of a United States Medical and Dental Academy for the purpose of training physicians and dentists for the Armed Services and the United States Public Health Service

Association Position—The Association actively opposes this bill since faculties would be difficult to obtain, hospital service would be hard to execute in connection with the school, and the manner of selection of the entrants would probably be political

H R 2838

Introduced by Mr Elliott of Alabama and referred to the House of Representatives Committee on Education and Labor

Digest of Bill—The bill would authorize the appropriation of 32 million dollars for the fiscal year 1954 to establish a program of federal aid to students in higher education. The bill provides for a gradual increase in authorized appropriation until 1957, when the cost would be 128 million dollars. States would administer the program under federal regulation promulgated by the Office of Education of the Federal Security Administration. Four year college scholarships would be allowed, with loans to students not to exceed \$800 per year. Medical education would be included, although it is not specifically referred to in the bill.

Association Position—The Association actively opposes this bill for the reasons outlined under S 461

TAX RELIEF**H R 474**

Introduced by Mr Keating of New York and referred to the House of Representatives Committee on Ways and Means

Digest of Bill—This bill would, in part, amend section 23 (x) of the Internal Revenue Code (relating to deductions from gross income) and provide for a graduated scale of medical care deductions based on adjusted gross income. It would include in the term 'medical care' amounts not compensated for by insurance or otherwise that are paid for the diagnosis, cure, mitigation, treatment or prevention of disease or for the purpose of affecting any structure or function of the body (including amounts paid for accident and health insurance).

Association Position—The Association actively approves this bill in principle since it would afford individual relief in cases of extremely high medical expenses and would also be an incentive to buy voluntary health insurance.

H R 482

Introduced by Mr Keating of New York and referred to the House of Representatives Committee on Ways and Means

Digest of Bill—This bill would amend part III of chapter I of the Internal Revenue Code as amended and insert a new section 36 to provide for the deduction of sums paid as premiums or subscription charges for health or medical insurance or plans from federal income tax, irrespective of whether such plans or programs are operated, financed, or administered by or through either public or private organizations or individuals.

Association Position—The Association approves the bill in principle.

H R 2243

Introduced by Mr Dague of Pennsylvania and referred to the House of Representatives Committee on Ways and Means

Digest of Bill—The bill would authorize the deduction of medical and dental expenses from gross income for income tax purposes. The term 'medical expenses' is defined by the bill to include amounts paid for the diagnosis, cure, mitigation, treatment or prevention of disease or for the purpose of affecting any structure or function of the body (including amounts paid for accident or health insurance). Such medical expenses incurred by the taxpayer, his spouse or his dependents would be deductible.

Association Position—The Association actively approves the bill in principle since it would afford individual relief in cases of extremely high medical expenses and would also be an incentive to buy voluntary health insurance. Under present law medical expenses are deductible only after the adjusted gross income has been determined and such expenses exceed a minimum amount (5% of adjusted gross income) and are not in excess of a fixed maximum (\$2,500 on an individual return or \$5,000 for a husband and wife jointly).

SOCIAL SECURITY AND DISABILITY INSURANCE**H R 383 (similar bills H R 2070 and H R 2150)**

Introduced by Mr Byrd of West Virginia and referred to the House of Representatives Committee on Ways and Means

Digest of Bills—The bills would amend Title II of the Social Security Act to provide cash disability insurance benefits for totally disabled individuals. These monthly benefits would be payable after a six month waiting period to those persons 'unable to engage in any substantially gainful activity by reason of any medically demonstrable physical or mental impairment, or blindness'. Medical examinations to determine eligibility for disability benefits would be performed by federal employees or private physicians in accordance with regulations promulgated by the administrator. The cost of such examinations and necessary travel expenses would be paid from the Social Security Trust Fund. Periodic reexaminations would be similarly conducted and financed. Failure to submit to such examination or to accept rehabilitative services would be sufficient grounds for suspension of benefits.

Association Position—The Association actively opposes the bills thus reiterating the past opposition of the Association to amendments to the Social Security Act providing for permanent and total disability and cash sickness benefits and a broad rehabilitative program for Social Security beneficiaries. It is the belief of the Association that the initiation of a federal disability benefit program would represent a major step toward the wholesale nationalization of medical care and the socialization of the practice of medicine. The provisions in these bills regarding disability certification would establish an inferior type of physician patient relationship, which, along with the entire program, would undoubtedly result in a deterioration of medical care.

H R 1376

Introduced by Mr Bryson of South Carolina and referred to the House of Representatives Committee on Ways and Means

Digest of Bill—The bill would amend Title II of the Social Security Act by reducing the age requirement for Old Age and Survivors Insurance benefits from 65 to 62 and, in addition, would authorize the payment of such benefits to an individual when 'his permanent physical or mental condition became such that he was unable to engage in any regular employment'. The bill does not spell out the criteria to be applied in making such determinations or how the provisions shall be administered.

Association Position—The Association actively opposes the bill for the reasons specified in connection with H R 383.

H R 2000

Introduced by Mr Rhodes of Pennsylvania and referred to the House of Representatives Committee on Ways and Means

Digest of Bill—The bill would amend Title II of the Social Security Act to provide cash disability insurance benefits for permanently and totally disabled individuals. These monthly benefits would be payable after a six month waiting period to persons unable "to engage in any substantially gainful activity by reason of any medically determinable physical or mental impairment which can be expected to be permanent, or blindness". The bill does not spell out the criteria to be applied in making such determination or how the provisions shall be administered.

Association Position—The Association actively opposes the bill for the reasons outlined in connection with H R 383

H R 2446 (identical bills H R 2447 and H R 3105)

Introduced by Mr Angell of Oregon and referred to the House of Representatives Committee on Ways and Means

Digest of Bills—The bills would repeal Titles I and II of the present Social Security Act and would create a new Social Security System on a pay as you go basis. The following persons would be eligible for a monthly annuity of an undisclosed amount (a) citizens 60 years of age or over, (b) citizens who are "disabled" for a period longer than six months, and (c) widows who are citizens and have the care of one or more children under 18 years of age. The annuity to be paid would, by the terms of the bills, necessarily be spent in the United States, its territories, or possessions within 30 days after receipt. The annuitant could not engage in any occupation for which a wage, profit, or other compensation is received and still be paid a monthly benefit. The program would be financed by a fixed 2% tax to be collected monthly on the gross income of all persons or companies derived from any source. In connection with personal income there would be an exemption of \$250 per month. Certain fraternal, religious, and other eleemosynary organizations would be excluded from the provisions of the act. The taxes thus collected would be placed in a "Business Employment and Security Insurance Account" from which the monthly benefits would be paid.

Association Position—The Association actively opposes these bills because they would authorize permanent and total disability benefits, to which the Association has repeatedly voiced its opposition. The Association also feels that such legislation should be held in abeyance pending a report from the commission that has been proposed to study governmental functions and fiscal resources (see S 1514). The Bureau of Medical Economic Research of the American Medical Association is in the process of preparing a report on the general subject of pay-as-you go Social Security plans.

COMPULSORY HEALTH "INSURANCE" AND FEDERAL SUBSIDIZATION OF PRIVATE PLANS

H R 1590

Introduced by Mr Miller of California and referred to the House of Representatives Committee on Post Office and Civil Service

Digest of Bill—The bill would authorize, on the request of the employee and under regulations to be promulgated by the Civil Service Commission, the withholding of premium payments for life, health, accident, medical, and hospitalization insurance from the compensation due to federal employees.

Association Position—The Association opposes the bill pending further information from the Council on Medical Service and the Bureau of Medical Economic Research.

H R 1817

Introduced by Mr Dingell of Michigan and referred to the House of Representatives Committee on Interstate and Foreign Commerce

Digest of Bill—This is an omnibus bill (163 pages) that would provide for a variety of legislative changes in the role of the federal government in medicine. Briefly, the bill would provide (a) federal aid to medical, dental, etc., education, (b) federal subsidization of practical nurse training, (c) increased federal subsidization of medical research, (d) authorize an extensive survey of hospital facilities and extend federal assistance in hospital construction, (e) federal assistance in supplying physicians and medical facilities to rural areas, (f) federal aid to local public health units, (g) federal research in child and maternal health, and (h) establishment of a federal national health "insurance" program.

Association Position—The Association actively opposes the bill.

AID TO THE HANDICAPPED

H R 402

Introduced by Mr Celler of New York and referred to the House of Representatives Committee on Education and Labor

Digest of Bill—The bill would amend various existing laws dealing with federal aid to the blind and other seriously disabled persons. The purpose of the act is to authorize a comprehensive grant-in-aid program to assist the states in furnishing a variety of services to the blind and others seriously disabled.

Association Position—The Association actively opposes the bill pending the report of the Commission on Federal State Relationships.

H R 2096 (identical bills H R 2147, H R 2149, H R 2300, H R 2342, H R 2346, H R 2519, H R 3177, H R 3188, H R 3291)

Introduced by Mr Hagen of Minnesota and referred to the House of Representatives Committee on Education and Labor

Digest of Bills—The bills propose to establish an independent federal agency to be known as the Federal Agency for Handicapped, to provide various types of rehabilitative services to persons physically or mentally handicapped. The agency would absorb the functions of the Office of Vocational Rehabilitation, the Division of the Physically Handicapped in the Bureau of Labor Statistics, the functions of the Library of Congress in furnishing aid for the blind, and the functions of the Federal Security Agency with respect to the Vocational Rehabilitation Act and state grants for aid to the blind. The new agency also would coordinate all other rehabilitative measures for the benefit of handicapped persons, administered by other agencies of the government.

Association Position—The Association opposes these bills pending the report of the Commission on Federal State Relationships.

MISCELLANEOUS

S 601 (identical bills S 835 and H R 2769)

Introduced by Mr Humphrey of Minnesota to the Senate Committee on Labor and Public Welfare

Digest of Bills—The bills would amend section 704 of the Federal Food, Drug, and Cosmetic Act by restoring authority in the Food and Drug Administration to inspect factories with out first making a request and obtaining permission. Written advance notice would suffice.

Association Position—The Association approves the principle of the bills, provided that proper safeguards are included to protect the physician-pharmacist-patient relationship. It believes that the inspection privilege should not be extended to confidential business and professional records that have no specific bearing on the enforcement of the Food, Drug, and Cosmetic Act.

S 967 (identical bill H R 3171)

Introduced by Mr Taft of Ohio and Mr Hill of Alabama to the Senate Committee on Labor and Public Welfare

Digest of Bills—The bills would amend Title VI of the Public Health Service Act as amended, to extend to June 30, 1957, the annual appropriation of 75 million dollars to assist the states in the construction of public and other nonprofit hospitals.

Association Position—The Association approves these bills.

S 994

Introduced by Mr Saltonstall of Massachusetts and six others to the Senate Committee on Labor and Public Welfare

Digest of Bill—The purpose of the bill is to develop and extend basic state and local public health organizations through federal subsidization. The bill would authorize state grants to develop and maintain public health services, including the establishment of new local public health units and the training of personnel for state and local public health work and to

provide measures for the prevention, treatment, and control of disease. The section would also authorize the Surgeon General of the United States Public Health Service to provide demonstrations and to train personnel for state and local public health work.

Association Position—The Association opposes the bill, pending the report of the Commission on Federal-State Relationships.

S 1514

Introduced by Mr Taft of Ohio and referred to the Senate Committee on Government Operations.

Digest of Bill—The bill would establish a Commission on Governmental Functions and Fiscal Resources. Of the 25 commission members, 15 would be appointed by the President, 5 by the President of the Senate, 3 from the majority party and 2 from the minority party, and 5 by the Speaker of the House of Representatives, 3 from the majority and 2 from the minority. The commission would study and investigate all the activities in which federal aid is extended to state and local governments. The objective would be to determine whether there is justification for such federal aid, whether there are other fields in which the federal government should participate, whether federal control should be limited, and whether federal aid should be limited in cases of need, and the ability of the federal government and the states to finance such activities. The commission would submit its final report, including legislative recommendations, not later than March 1, 1954, and could make interim reports.

Association Position—The Association actively approves S 1514, as well as an identical bill introduced in the House of Representatives, H R 4406, 83rd Congress. It is the belief of the Association that such a survey is imperative to determine whether there is justification for federal aid in the various fields in which such assistance has been extended during the past few years, whether such activities should be limited and if so to what extent, and finally, to permit an over all appraisal of the ability of the federal government to finance activities of this nature.

H R 116

Introduced by Mrs Church of Illinois and referred to the House of Representatives Committee on the Judiciary.

Digest of Bill—The bill would amend Title 18, U S C, Chapter 39, so as to prohibit the interstate transportation of fireworks into any state in which the sale of such fireworks is prohibited, unless they are to be used for public displays or other purposes specifically authorized by the laws of such state.

Association Position—Because of the serious injuries that result from the indiscriminate use of fireworks, the Association approves the principle of the bill and has submitted a statement to the Committee on the Judiciary of the House of Representatives in this regard.

H R. 633 (Identical bill H R 2862)

Introduced by Mr Teague of Texas and referred to the House of Representatives Committee on Veterans Affairs.

Digest of Bills—The bills would establish a federal Board of Hospitalization to be composed of the Attorney General of the United States, the secretaries of Defense and the Interior, the administrators of Veterans Affairs, the Federal Security Agency, and the General Services Administration, and the Director of the Bureau of the Budget. The Administrator of Veterans' Affairs would act as chairman of the board.

The Board would attempt to coordinate the construction and utilization of hospital facilities by the federal government to prevent overlapping and duplication of services and overbuilding of facilities.

Association Position—The Association approves the principle of the establishment of a federal Board of Hospitalization but disapproves the present bills. The Association recommends that any board that is established be composed of the Secretary of the Interior, the Director of the Budget, and a representative of the Department of Defense, and that the

number of civilian members be at least equal to the number of government representatives. Government officials in charge of medical programs should serve in an advisory capacity only.

H R 2449

Introduced by Mr Bailey of West Virginia and referred to the House of Representatives Committee on Interstate and Foreign Commerce.

Digest of Bill—The bill would establish an independent agency to be known as the Bureau of Clinics for the treatment of chronic alcoholics and narcotic addicts. The bureau would also assist states and private agencies to establish farms and to train and educate personnel in approved methods of treatment, cure, and rehabilitation of drug addicts and alcoholics. The facilities of the United States Employment Service would be used in finding suitable employment for those rehabilitated. The powers, duties, responsibilities, and functions vested in the Surgeon General of the United States Public Health Service would be transferred to the new Bureau.

Association Position—The Association opposes the bill because it feels that if such a program is to be developed, it should be under the direction of the United States Public Health Service. Also, the Association does not look with favor at this time on the establishment of new bureaus in the government.

FEDERAL MEDICAL LEGISLATION

Vocational Rehabilitation for Mental Patients

Senator Humphrey (D, Minn.), has introduced S 2145, which would amend the Vocational Rehabilitation Act by redefining 'vocational rehabilitation' and 'rehabilitation services' so as to include mental conditions, and also would extend the definition of hospital as used in the Hospital Construction Act to include hospitals furnishing primarily domiciliary care. The bill would authorize the use of federal grants to states for corrective surgery or treatment of mental as well as other disabling conditions. The measure was referred to the Labor and Public Welfare Committee.

Post High School Scholarship Loans

Senator Langer (R, N D), introduced a bill to authorize appropriation of 50 million dollars to be administered by the U S Commissioner of Education as a revolving fund for direct loans to students for vocational, technical, academic, or professional education beyond high school. Loans could be used for tuition, books, supplies, board, lodging, or other necessary educational expenses, but could not exceed a total of \$1,000 to an individual person. Students would be required to give a note bearing interest at 1% and maturing in 15 years. Schools would be required to furnish a certificate that the applicant is qualified for the proposed course of study. The bill was referred to the Labor and Public Welfare Committee.

Reorganization of the Department of Defense

H R 295 and a bill H R 5845, both introduced by Condon (D, Calif.), would have disapproved or modified the Presidential Reorganization Plan No 6 because of two provisions designed to strengthen the authority of the chairman of the joint chiefs of staff. The resolution lost by 2 to 1 on the floor and the presidential plan became effective June 30. Medical interest is centered on an assistant secretary who will be responsible for health and medical matters. The bills were referred to the Government Operations Committee.

Silicosis Investigation

Congressman Metcalf (D, Mont.), has introduced a resolution H R 286 which would authorize the House Committee on Education and Labor to investigate prevention and control of occupational diseases in the mining industry. The resolution was referred to the Rules Committee.

The summary of federal legislation was prepared by the Washington Office of the American Medical Association and the summary of state legislation by the Bureau of Legal Medicine and Legislation.

Bricker Resolution

Chairman Reed (R, Ill.), of the Judiciary Committee has introduced H J R 280 which is identical with S J R 1, as amended and reported by the Senate Committee on the Judiciary. The new language was suggested by the American Bar Association and substituted for the original language of the Bricker Resolution. The measure was referred to the Judiciary Committee.

STATE MEDICAL LEGISLATION**Alabama**

Bills Introduced.—S 232 proposes to authorize and regulate the fluoridation of water supplies and to exempt municipalities from liability for losses or injuries resulting from the addition of fluoride to the water supply when done in conformity with this proposal.

California

Bills Enacted.—S J R. 33 has become ch. 140 of the laws of 1953. It memorializes the Congress of the United States to increase the staff of federal narcotic enforcement agents and the number of border inspections and recommends that the United States confer authority upon state and local narcotic enforcement officers in border cities and counties to conduct searches and make inspections at border areas. S J R. 34 has become res. ch. 141 of the laws of 1953. It memorializes the Congress of the United States to amend the narcotic drugs import and export act so as to increase the penalties of second and subsequent narcotic offenders. S R. 112 was adopted June 10, 1953. It provides for the creation of an interim commission on the licensing of business and professions and directs such commission to ascertain study and analyze all facts relating to the licensing of business and professions in California. S 1770 has become ch. 1098 of the laws of 1953. It prohibits the operation, establishment, and conduct of a clinic unless a license has first been obtained from the state department of public health. A clinic is defined as a place, establishment or institution which operates under the name or title of clinic, dispensary, health center, medical center or any other word or phrase of like or similar import either independently or in connection with any other purpose for the purposes of furnishing at the place establishment or institution advice, diagnosis, treatment, appliances or apparatus to persons not residing or confined in the place establishment or institution who are afflicted with bodily or mental disease or injury.

Connecticut

Bills Enacted.—H J R. 87 was adopted May 22, 1953. It directs the legislative council to make a study of the care and treatment of habitual alcoholics afflicted with tuberculosis and to report back to the 1955 legislature. S 897 has become public act No. 389, of the acts of 1953. It provides for the licensing, inspection and regulation of certain institutions among which are medical facilities operated by the commission on the care and treatment of the chronically ill aged and infirm.

Delaware

Bills Enacted.—H 307 was approved June 18, 1953. It provides an appropriation to the state board of health to be used for the purpose of carrying out of a state-wide chest x-ray survey. H 356 was approved June 22, 1953. It authorizes the medical council to issue temporary emergency certificates, said temporary emergency certificates to be limited to 12 months duration renewable at the discretion of the issuing authority to such physicians licensed in a state of the United States other than Delaware as shall be found qualified to practice as such in this state during a serious public emergency. The holder of such temporary certificates shall be privileged during the terms specified therein to practice his profession within the state subject to laws generally applicable to the practice of the profession and to regulations and restrictions imposed by the medical council.

Florida

Bills Enacted.—H 536 was approved June 12, 1953. It amends the law relating to osteopathy by increasing the educational requirements of applicants and by adding a list of subjects in which applicants must be examined. H 1109 became law without approval June 15, 1953. It provides regulations relating to agreements for the maintenance of personal care for a period of one or more years or for life or for a fixed fee. The term personal care is defined as including the furnishing of medicine and medical attention. H 1367 was approved June 12, 1953. It fixes the salary of county medical examiners and assistant county medical examiners and authorizes the employment by the county medical examiner of pathologists, toxicologists, chemists and other specialists and technicians when necessary. H 1754 became law without approval June 15, 1953. It provides for the creation of liens in favor of hospitals maintained in counties having a population of not less than 60,000 people. The lien would be in the amount of the value of care rendered to an injured person and would be upon any claim which such injured person might have against another for damages causing the injuries necessitating the hospital care. H 1755 was approved June 12, 1953. It provides a lien in favor of hospitals operated in Volusia County. The lien would be in the amount of the value of hospital care rendered to a person and would be upon any claim which such person might have against another for damages for the injuries making the rendition of hospital care necessary. H. 1856,

became law without approval June 15, 1953. It creates a Halifax Osteopathic Hospital District with authority to raise funds for the establishment and creation of an osteopathic hospital. S 14 became law without approval June 15, 1953. It amends the narcotic act by adding to the list of narcotic drugs any drugs to which the narcotic laws of the United States apply and any drugs which have been determined by the state board of health as having addiction forming or addiction sustaining qualities similar to cocaine, opium, isonipecaine and cannabis. The new law also adds penalties for violations of the act in connection with minors and provides that for a third or subsequent offense the offender may be punished by imprisonment up to 20 years and may not receive a suspended sentence or probation. S 597 became law without approval June 15, 1953. It revises and reenacts the Florida Pharmacy Act. S 783 was approved June 11, 1953. It provides for the creation of a Florida rehabilitation center for alcoholics the duty of which shall be to formulate and effect a plan for the prevention, care, treatment and rehabilitation of alcoholics. S 916 became law without approval June 15, 1953. It authorizes boards of county commissioners and boards of public instruction in certain counties in the state to provide for life, health, accident, hospitalization, or annuity insurance for employees and their families upon a group insurance plan.

Hawaii

Bills Enacted.—H 325 was approved June 16, 1953. It provides that no person shall at any time have or possess a hypodermic syringe or needle or any instrument or implement adapted to the use of habit forming drugs by injection which is possessed for his personal use in administering habit forming drugs unless such possession be authorized by the certificate of a physician and issued within a period of one year prior to such possession. S 567 was approved June 16, 1953. It makes it the duty of every physician and surgeon attending or treating a case of knife wound, bullet wound, gunshot wound, powder burn or any injury that would seriously maim, produce death or has rendered the injured person unconscious caused by the use of violence or sustained in a suspicious or unusual manner to report such case to the chief of police. When such case is treated in a hospital or clinic the superintendent shall also report it.

Illinois

Bills Enacted.—H 698 was approved June 16, 1953. It requires all drug addicts to register with the department of registration and education and to obtain a card which he shall carry with him at all times. The law however does not apply to persons who repeatedly use narcotic drugs when the same are prescribed administered or dispensed by a licensed physician or licensed dentist or are administered or dispensed by a nurse or intern under the direction or supervision of such physician or dentist. H 823 was approved June 16, 1953. It creates a Krebiozen Investigating Commission to make a thorough investigation for the purpose of ascertaining the facts of the controversy that has arisen at the University of Illinois concerning research on krebiozen and to report back to the 1955 legislature.

Massachusetts

Bills Introduced.—S 756 proposes the creation of a special committee to make a study of the workmen's compensation law.

Michigan

Bills Enacted.—H 342, has become public act no. 95 of the acts of 1953. This was erroneously designated H 1342 in THE JOURNAL (152:826 [June 27] 1953). It provides that no autopsies, postmortems, and dissections shall be performed upon the body of a deceased person except by a licensed physician who has been granted written consent therefor by whichever one of the following assumes custody of the body for the purpose of burial: father, mother, widow, widower, guardian next-of-kin or person charged by law with the responsibility of burial.

Oklahoma

Bills Enacted.—H J R. 530 was approved May 16, 1953. It provides for the appointment of a joint committee for the purpose of studying the problem raised by the present institutional care and housing of the aged and senile both within and without the mental institutions of Oklahoma. H 1099 was approved May 25, 1953. It amends the law relating to the practice of chiropractic by providing eight new grounds for revocation or suspension of a license. S 60 was approved June 8, 1953. It authorizes the state commissioner of health to designate by list or general definition those diseases or illnesses which should be reported and to request all physicians of the state to cooperate in the reporting of such diseases. S 153 was approved June 8, 1953. It authorizes the state board of health to approve the use of antiseptic other than nitrate of silver, for use in the eyes of new born children and to prescribe the manner of their use. S 158 was approved June 12, 1953. It provides an appropriation for the University of Oklahoma School of Medicine for the purpose of conducting research on heart disease and cancer control. S 246, was approved May 18, 1953. It provides for the licensing of physical therapists by the state board of medical examiners and defines physical therapy as any professional service requiring special education, knowledge or skill in the treatment of any bodily conditions of any person by the use of physical, chemical and other properties of heat, light, water, electricity, massage and therapeutic exercise which includes posture and rehabilitation procedures. Diagnosis for therapeutic purposes, the use of roentgen rays for diagnostic and therapeutic purposes, radium for therapeutic purposes, the practice of orthopedic, the use of electricity for surgical purposes including cauterization and major and minor surgery are not authorized under the term physical therapy.

COMMITTEE ON MENTAL HEALTH

Mental Health Activities of State Medical Associations

In January of this year, Dr. George Lull, Secretary of the Association wrote to each of the secretaries of the state and territorial medical associations advising them that the newly formed Committee on Mental Health of the A M A had had several meetings, and that one of the matters discussed had been the possibility of establishing a strong liaison between this new committee and committees on mental health or mental hygiene of state medical associations for the purpose of exchanging plans and information.

To date, some 26 replies have been received from secretaries of state associations or from chairmen of committees on mental health of these associations. These letters indicate that 24 of the 26 associations have already established committees on mental health or mental hygiene and have active programs underway. In many instances, replies indicated not only that committees had been formed but also described the types of work that had already been undertaken.

The Committee on Mental Health has reviewed the replies, and has prepared the material in summary form for distribution to state and territorial associations. Inasmuch as the replies from the state associations indicated that the programs that are now underway vary widely from a broad range of activities to participation in only a few activities, we thought it of value to list some of the activities in which state association committees on mental health might take an active interest. Many of these activities have already been sponsored in some of the states.

1 Study of Blue Cross Blue Shield and other medical service plans to determine ways by which these plans may more effectively provide for treatment of mental and emotional illness (Bennett, A. E., Hargrove, E. A., and Engle, B. Voluntary Health Insurance and Nervous and Mental Disease, J A M A 151:202 [Jan 17] 1953).

2 Establishment of citizen groups for promotion of mental health education services (women's auxiliaries).

3 Recommendations to legislatures for increased budgets for mental institutions (Present average is about a \$2 per patient per day level for patient maintenance. It has been demonstrated that this low budgetary level is responsible in great part for the present nationwide difficulty in properly caring for patients in mental institutions [The Mental Health Programs of the Forty-Eight States, Council of State Governments, Chicago, 1950]). The Committee on Mental Health of the American Medical Association and the American Psychiatric Association are both in agreement that budgetary levels need to be materially increased. Under present conditions, they should approximate a level of \$5 per patient per day.

4 Serving as a central office for dissemination of information on programs for mental health to the medical profession and public.

5 Efforts toward the establishment of psychiatric departments or services in general hospitals and increasing other psychiatric services in the community.

6 Recommendations to legislative committees of state medical associations that changes or amendments be made in medical practice acts to include "mental illness" and "psychotherapy" as being within the legal definition and responsibility of the practice of medicine.

7 Improvement of facilities and level of professional care in state institutions for care of mentally ill (See Standards for Psychiatric Hospitals and Clinics, Prepared by the Committee on Psychiatric Hospital Standards and Policies, American Psychiatric Association, 1951).

8 Establishment of facilities for psychiatric consultation to courts and penal institutions.

9 Review of, and sponsorship of, legislation for state mental health activities relating to problems of alcoholism and addiction.

10 Sponsorship of improved state laws for commitment to mental institutions and provision for and encouragement of voluntary admissions to mental institutions (References to improve statutes are carried in The Mental Health Program of the Forty Eight States, Council of State Governments, Chicago, 1950).

11 Sponsorship of programs for postgraduate education of physicians in the utilization of psychiatric principles in the practice of medicine.

12 Sponsorship of programs in psychiatry and mental health in county society meetings during Mental Health Week in May of each year.

13 Encourage the setting up of collaborating Committees on Mental Health in all county societies.

As one of the activities of the A M A Committee on Mental Health for 1953, we are undertaking jointly with the American Psychiatric Association a meeting of executives of 50 or more organizations on a national level who now participate in work in the mental health field. At this meeting, we will review what is now being done by the many interested groups, and hope we will be able to establish a set of plans and objectives for our own committee that will best define our own proper spheres of activity. We particularly wish to avoid duplicating effective work that is now being accomplished by other national groups.

It has been suggested that following this meeting that a second meeting be sponsored by this committee to include mental health representatives of the state associations and county societies, with a view toward establishing coordinated planning for mental health activities by organized medicine as represented by the Association and affiliated state and county societies.

Leo H. Bartemeier, M.D.
Chairman
Committee on Mental Health

PROCEEDINGS OF NEW YORK MEETING

Resolutions on Advertising of Medical Products

Resolutions on Advertising of Medical Products were introduced in the House of Delegates at the New York Meeting by Dr. Wendell C. Stover, Indiana (see THE JOURNAL for June 27, 1953, page 844) and were referred to the Reference Committee on Miscellaneous Business.

The report of the reference committee on these resolutions, which was adopted by the House of Delegates, was inadvertently omitted from the published proceedings. It reads as follows:

With regard to the Indiana resolution concerning advertising of medical products, your committee has considered this most important matter and has listened to a great deal of very pertinent discussion by individual physicians, the Editor of THE JOURNAL and the Secretary of the Committee on Research of the Council on Pharmacy and Chemistry. We have concluded that this is a problem that cannot be solved by action of the House. The solution must depend on action of the Board of Trustees. Your committee therefore recommends that this matter be referred to the Board of Trustees, with the urgent request that it set up mechanisms that will in the future prevent the situation whereby advertisements in any or all American Medical Association publications are at variance with the scientific and editorial content of these publications. It also recommends that the same policy be followed by all other medical journals.

MEDICAL NEWS

CALIFORNIA

Society News.—At its annual meeting, the California Society of Allergy elected Dr Grace M Talbott, San Francisco, president, Dr Norman M Shure, Los Angeles, president-elect, and Dr Lazarre J Courtright, San Francisco, secretary treasurer

Hospital Establishes Scholarship Plan.—In a plan initiated by Dr Charles L Lowman, director of education and rehabilitation, the Orthopaedic Hospital in Los Angeles has established tuition loan scholarships at the University of Southern California, Los Angeles, for students interested in becoming physical or occupational therapists. The plan provides for three tuition scholarships a year (\$772 each, per school year) over a period of five years, when, it is anticipated, the loan fund will be self sustaining. Recipients will be asked to repay the loans, probably at a 6% interest rate, following graduation, with repayment based on the following plan: 20% the first year, 30% the second, 40% the third, and 10% the fourth year. Graduates employed by the Orthopaedic Hospital will not be charged interest over the period of employment. Students interested in the loans apply directly to the University of Southern California, which handles the Charles LeRoy Lowman Fund.

COLORADO

Warning—Magazine Salesman.—The Denver Area Better Business Bureau reports that Lauren Graff, a magazine salesman, recently victimized Denver physicians and dentists by taking magazine subscriptions for which he collected the money in advance and then failed to turn in the subscriptions. In Denver, he gave a fictitious address. He is described as a slight young man in his early 20s. He has a sallow complexion and light brown hair, is about 5 ft 3 in tall, and weighs 110 lb. He has a crippled right hand and walks with a limp. He represents himself as a salesman for the Keystone Readers Service of Los Angeles but is no longer in their employ.

CONNECTICUT

University News.—Joseph K Hill, Ph D, lecturer in education and public health at Yale University School of Medicine, New Haven, has been appointed assistant professor of public health and preventive medicine at the State University of New York College of Medicine at Syracuse.

Appoint Surgeon General of National Guard.—Lieut Col Joseph E Sokal, New Haven, commanding officer of the 118th Medical Battalion, 43rd Infantry Division, Connecticut National Guard, has been appointed Surgeon General of Connecticut. He succeeds Brig Gen William B Smith of Wethersfield, who retired last month upon reaching the statutory age limit. On active duty with the U S Army Medical Corps from 1942 to 1946, Dr Sokal spent three years in the Pacific theater, most of that time with the 'Fighting 69th Regiment of the 27th Infantry Division. Veteran of two beach heads, Makin and Saipan Islands, he also served with occupation forces in Japan as a regimental surgeon in the Eleventh Airborne Division.

ILLINOIS

Rabies Quarantine.—A portion of Downers Grove township, Du Page County, was recently placed under rabies quarantine after five children were bitten by a rabid fox terrier. Hinsdale has also been placed under antirabies quarantine for three months. During this time the dogs in Hinsdale must be kept

on their own property as a precautionary measure. Vaccination of all dogs is required by Hinsdale ordinance before a license can be issued. Fines of \$25 to \$100 are provided for quarantine violations.

Personal.—Dr Samuel P Durr, Rock Island, has resigned as city physician after five years in that office. Dr David A Goldsmith, who was formerly affiliated with Wesley Memorial Hospital and Cook County Hospital in Chicago and with Veterans Administration hospitals in Hines, Ill., and in Iron Mountain, Mich., has been appointed Dr Durr's successor. During World War II Dr Goldsmith served as a lieutenant in the Navy Medical Corps. During the 50th anniversary commencement program at James Millikin University, Decatur, Dr R Zink Sanders of that city was named alumnus of the year.

CHICAGO

Portal House Moves.—Portal House of the Chicago Committee on Alcoholism has moved to new quarters at 743 N Wabash Ave., Chicago 11. The telephone number is MOhawk 4-5536.

Rheumatic Fever Institute in October.—The board of trustees of La Rabida Sanitarium announces that an institute in rheumatic fever will be held for the first time on Oct. 12 and annually thereafter. This is the anniversary period of the opening of the hospital on Oct. 21, 1932. On Oct. 16 the trustees will dedicate the new Gertrude F Pick Memorial Center for community service in rheumatic fever. On Robert A Black Day, a lecture in Dr Black's memory will be inaugurated. The five day institute will be conducted by members of the hospital staff and persons from the medical schools in Chicago with which the hospital is affiliated and by invited guests. It will be directed primarily to general practitioners, nurses, social workers, occupational therapists, and dentists. There will be scientific sessions and sessions for the public. Advance registration will be required for those who wish to attend the entire five day session. Visitors to individual sessions will be admitted by card on previous application. There will be no admission or tuition charge. Information will be supplied by circular on application to Institute, La Rabida Sanitarium, E 65th St and South Shore Drive, Chicago 49.

MAINE

Emergency Poliomyelitis Equipment.—The Portland office of the National Foundation for Infantile Paralysis is acquiring information from hospitals throughout the state to determine their equipment resources, including iron lungs and hot pack machines. This information will be catalogued and used for emergency situations. Physicians may obtain information on the location of equipment by calling the Maine state office of the National Foundation for Infantile Paralysis at Portland 2-8353. After hours call Mr George H Hawkins, Bar Mills 5211, Mr Paul F Hungerford, Westbrook 1312 J, or Miss Butkis, office secretary, Portland 4 3370.

MASSACHUSETTS

Dr Wilnsky to Retire.—Dr Charles F Wilnsky, executive director, Beth Israel Hospital, Boston, will retire Sept. 1 after 25 years of service in the field of hospital administration. On retiring from his post as assistant health commissioner of the City of Boston last January, he was appointed consultant to the Boston Department of Health. In the current year, the Massachusetts Public Health Association presented him with the Lemuel Shattuck Award, and Suffolk University conferred on him an honorary doctorate. Dr Cecil G Sheps, who will succeed Dr Wilnsky, is currently director of program planning and research professor at the University of North Carolina, Chapel Hill.

Physicians are invited to send to this department items of news of general interest, for example those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

NEW YORK

Eastman Gift to Hospital—A gift of \$1,200,000 from the Eastman Kodak Company makes up the difference between the funds available and the funds required to complete, including necessary equipment, the 245 bed Northside Hospital in Rochester. The eight story institution will be erected on a 75 acre tract on the west side of Portland Ave., just north of the city line. A new type of call system between patient rooms and nurses stations is planned that will enable the nurse on duty to communicate directly with the patient.

New York City

Beekman Downtown Hospital Dedicated—The new \$5,500,000 Beekman Downtown Hospital, said to be the first voluntary general hospital to be built in Manhattan in 20 years, was recently dedicated. The building at Beekman and William streets, which replaces the structure at Beekman and Water streets, has a bed capacity of 170, and it will serve many more clinic or outpatients than formerly. Because the eight story

Beekman Downtown Hospital

structure is built on two street levels, the new hospital has two main floors with access to the street. There are 31 private and semiprivate rooms, 115 ward beds, and 5 operating rooms. Dr. Robert H. Kennedy heads the medical board.

OHIO

Fetterman Memorial Fund—Friends of the late Dr. Joseph L. Fetterman have established the Joseph L. Fetterman Memorial Fund for cancer research at Western Reserve University School of Medicine, Cleveland. Contributions for the fund may be sent to the medical school or to the Cleveland Chapter of the American Cancer Society.

Dr. Peters Goes to Tulane—Lawrence Peters, Ph.D., associate professor in pharmacology at Western Reserve University School of Medicine, Cleveland, has been appointed professor of pharmacology, Tulane University of Louisiana School of Medicine, New Orleans, to succeed Dr. Ralph G. Smith, who resigned in 1950 to join the U.S. Food and Drug Administration. Dr. Peters from 1942 to 1944 served in the medical research division of Sharp and Dohme, Inc. He has been affiliated with the Western Reserve University School of Medicine in Cleveland since that time and in 1950 was appointed a scholar in medical science by the John and Mary R. Markle Foundation.

PENNSYLVANIA

Gavel of Mastodon Ivory—The Philadelphia County Medical Society has received from Dr. George E. Pfahler, Philadelphia, a gavel made of mastodon ivory obtained in Alaska. In presenting the gavel he said: "The mastodons in Alaska were present in the Pleistocene Period, probably 25,000 years ago, when Alaska had a tropical climate." Dr. Pfahler recently presented a similar gavel to the American College of Radiology.

Personal—Dr. John R. Simpson, Huntingdon, was honored at the annual alumni luncheon of his alma mater, Franklin and Marshall College, Lancaster, when the alumni medal for distinguished service to the college and the alumni association was presented to him. Dr. J. Lumen Popp, New Castle, was recently honored at the Elks Home when the Fraternal Order of Police presented him with a badge as honorary chief of police and a certificate of honor that stated that he had given his efforts unselfishly in behalf of the police. Dr. Leroy E. Chapman, Warren, received an honorary degree at the 70th commencement exercises of the Philadelphia Textile Institute in Germantown on June 13. Dr. Chapman has been a member of the state senate since 1930. He holds honorary degrees from Hahnemann Medical College and Hospital of Philadelphia, Temple University, and Woman's Medical College of Pennsylvania, Philadelphia.

Philadelphia

University News—The National Foundation for Infantile Paralysis has made a five year March of Dimes grant of \$120,000 to the University of Pennsylvania School of Medicine, where the new rehabilitation center for aid of the physically handicapped will soon be in operation. The center will be directed by a commission on rehabilitation composed of department heads in the medical school and hospital of the University of Pennsylvania, with Dr. George Morris Piersol as chairman. Dr. William Dunbar, associate in medicine, public health and preventive medicine, has been appointed coordinator of rehabilitation to promote the rehabilitation teaching program in the medical school and to maintain contacts between the university hospital and the outside agencies that will cooperate in the various phases of physical medicine and rehabilitation.

VERMONT

Expand Cardiac Program—A training grant of \$13,867 to the University of Vermont College of Medicine, Burlington, by the National Heart Institute will be used to expand the college teaching program in heart diseases, according to an announcement from Dr. George A. Wolf Jr., dean. Dr. Ellsworth L. Amidon, professor of medicine, will act as training program director. Facilities of the heart unit of the Bishop deGoesbriand Hospital will be developed under Drs. Wilhelm Raab and Eugene Lepeschkin.

WEST VIRGINIA

State Medical Meeting at White Sulphur Springs—The annual meeting of the West Virginia State Medical Association will be held at the Greenbrier White Sulphur Springs, July 23-25, under the presidency of Dr. James S. Klumpp, Huntington. A symposium on pain will open the scientific sessions Thursday morning, with Dr. Oscar B. Biern, Huntington, as moderator. Participants will be Dr. Bayard T. Horton, Rochester, Minn., Headache General Consideration; Dr. Albert I. Mendeloff, St. Louis, Practical Application of Recent Studies in Abdominal Pain; and Dr. Frank H. Mayfield, Cincinnati, Relief of Intractable Pain. A panel discussion will follow Thursday afternoon. Dr. Pat A. Tuckwiller, Charleston, will preside at a clinical pathological conference. At 6 p.m., a social hour will precede the Medical College of Virginia alumni dinner at which Dr. Jacob C. Huffman, Buckhannon, president of the West Virginia chapter, will be in charge. Thursday evening has been designated auxiliary night. A "chuck wagon dinner in the Colonnades dining room will be

followed by an old fashioned square dance in the ballroom Friday morning a symposium on emergencies in general practice will be moderated by Dr James L. Patterson, Logan. Participating will be Dr Thomas M. Durant, Philadelphia, "Cardiovascular Emergencies in General Practice", Dr Clarence Dennis, Brooklyn, "Surgical Emergencies", Dr Charles S. Stevenson, Detroit, "Obstetric and Gynecologic Emergencies", and Dr Edward L. Bortz, Philadelphia, "Medical Emergencies in Senior Citizens." A panel discussion, "What's New?" will follow.

Dr Klumpp will deliver the presidential address "The Price of Glory" at 9:30 p. m. Friday, after which Dr Edward J. McCormick, Toledo, Ohio, President of the American Medical Association, will speak on "The Public Service of the American Medical Association." On Saturday Dr Theodore P. Mantz, Charleston, will serve as moderator for the following program: Management of the Hard of Hearing Patient, Dr Richard E. Marcus, Chicago, "Diagnosis of Bone Tumors," Dr Vincent W. Archer, Charlottesville, Va., "Surgery of Trauma," Dr Edward J. McCormick, and "A Doctor's Responsibility in the Changing Order," Dr Howard A. Rusk, New York. A question and answer period will follow. Dr Dean L. Hosmer will moderate a symposium on low back pain, in which collaborators will be Drs Robert W. Johnson Jr., Baltimore, Frank H. Mayfield, Cincinnati, Vincent W. Archer, Charlottesville, Va., and Charles S. Stevenson, Detroit.

WISCONSIN

Course in Obstetrics—The University of Wisconsin Medical School, Madison, will present a postgraduate course in obstetrics, Sept. 1-3, under the direction of Dr John W. Harris and with the cooperation of all members of the department of obstetrics and gynecology. Dr Curtis J. Lund, professor of obstetrics and gynecology, University of Rochester (N. Y.) School of Medicine and Dentistry, will be the guest faculty member.

Personal—Dr Mildred E. Scott, who has been with the U. S. Public Health Service on loan to the Florida and Oregon state boards of health since 1949, has been appointed director of the state board of health's division of tuberculosis and heart disease control.—Dr Frank F. Newell was recently honored at a meeting of the Kiwanis Club of Burlington, where he has practiced for more than 50 years and where his father, the late Dr George Newell, and his brother, the late Dr G. Warren Newell, also practiced.

Appoint Head of Pathology Department—Dr Joseph F. Kuzma, Milwaukee, has been named director of the pathology department at Marquette University School of Medicine, Milwaukee, to succeed Dr W. A. Douglas Anderson, now chairman of the pathology department at Jackson Memorial Hospital, Miami, Fla. A member of Marquette's medical faculty for 13 years, Dr Kuzma has been promoted to the rank of professor. He has resigned as director of laboratories at Milwaukee County Hospital to accept full time appointment.

Academy Essay Contest—The Milwaukee Academy of Medicine and the Rogers Memorial Sanitarium offer prizes of \$200 and \$100 for the two most meritorious studies in neurology, psychiatry, and psychosomatic medicine. The contest is open to all members of the profession who are citizens of Wisconsin, whether actually in residence or not, and to those who, while not ordinarily residents of the state, are stationed in Wisconsin in the armed forces. Papers must be submitted in triplicate, double spaced, to the office of the Academy of Medicine, 561 N. 15th St., Milwaukee 3, not later than Dec. 1.

WYOMING

State Medical Election—At the annual meeting in Casper, the Wyoming State Medical Society elected Dr James W. Sampson, Sheridan, president, Dr Bernard J. Sullivan, Laramie, president elect, Dr Nels A. Vicklund, Thermopolis, vice-president, Dr Royce D. Tebbet, Casper, secretary, and Dr Curtis L. Rogers, Sheridan, treasurer. The 1954 meeting will be held in Sheridan during the first part of June.

GENERAL

Fellowship in Tuberculosis—The New York Tuberculosis and Health Association announces that the James Alexander Miller Fellowship for Research, with an annual stipend of \$5,000, will be available from July 1, 1954, to June 30, 1955. The fellowship is designed to support a qualified medical investigator who will devote full time to a research project with a definite bearing on tuberculosis. Awards will be announced Dec. 1. Application forms will be supplied on request by the New York Tuberculosis and Health Association, 386 Fourth Ave., New York 16.

Rheumatology Prize—Under the patronage of the Società Italiana di Reumatologia, Acqui's Health Resort office announces an international competition for an original, unpublished medical article dealing with the physiopathology, clinical history, and therapy of rheumatic and arthritic diseases. The prize of 1 million Italian liras (approximately \$1,600) will be awarded by the international judging commission. Articles may be written in Italian, French, English, Spanish, or German. The competition will close Jan. 31, 1954. For information, apply to the Azienda Autonoma di Cura—Acqui (Piemonte, Italy).

Damon Runyon Cancer Grants—The Damon Runyon Memorial Fund for Cancer Research, Inc., announces that since its inception in 1946, its nationwide grants have totaled \$6,708,347 to 246 fellows and 166 institutions in 46 states, the District of Columbia, and 14 foreign countries. Among the institutional grants for May, the largest (\$46,000) was made to Memorial Center for Cancer and Allied Diseases for two projects under the direction of Dr Cornelius P. Rhoads: "Studies on Serum Iodine and Serum Protein in Relation to Thyroid Function and to Treatment with Radioiodine" and "Clinical Studies of Viruses as Antineoplastic Agents."

WHO to Commemorate Nightingale Centennial—The executive board of the World Health Organization, at a recent session in Geneva, supported a Uruguayan proposal for the suitable commemoration in 1954 of the 100th anniversary of the work started by Florence Nightingale in providing nursing assistance to the sick and in the organization of nursing services. The board suggested that the theme for World Health Day in 1954 be some subject related to the role of nursing in public health, including reference to the work of Florence Nightingale. The seventh World Health Assembly will be convened at the Palais des Nations, Geneva, May 4, 1954, and the next meeting of the executive board will begin in Geneva Jan. 12, 1954.

Palmer Fellowships Awarded—Recipients of the first two-year Lowell M. Palmer Senior Fellowships in the Medical Sciences (J. A. M. A. 151:397 [Jan. 31] 1953), totaling \$88,000, have been announced by Dr Walsh McDermott, associate professor of medicine, Cornell University Medical College, New York, and Dr Geoffrey W. Rake, medical director, E. R. Squibb & Sons, chairman and vice chairman, respectively, of the selection board of the Lowell M. Palmer Fund. The fellows and their fields are: Dr Joseph Dancis, New York University College of Medicine (physiology of newborn), Dr Franklin W. Heggeness, University of Rochester School of Medicine and Dentistry (physiology of gastrointestinal tract), Dr Charles A. LeMaistre, Cornell University Medical College, New York (chronic bacterial infections), Dr William R. Milnor, Johns Hopkins University School of Medicine, Baltimore (cardiovascular research), Dr David T. Karzon, University of Buffalo School of Medicine (viral infections), and Dr Maurice S. Raben, Tufts College Medical School, Boston (pituitary hormones).

Incidence of Leprosy—According to reports from the American Geographical Society, there are about 2,000 cases of leprosy in the United States. All of the known cases in the United States are being or have been treated at the U. S. Marine Hospital (National Leprosarium) in Carville, La. The most heavily infected areas in the world are in Oceania, the East Coast of India, Northern Burma, and tropical Africa. The least infected locations are in Western Europe and in the

northern part of the Western Hemisphere. The significant rates of infection range from 0.008 per 1,000 in Tlaxcala State in Mexico, the least infected of the affected areas, to some 200 per 1,000 in the most seriously infected place, Easter Island. The world total of leprosy cases is estimated at about 5 million. The Leonard Wood Memorial, various religious groups, and the American Geographical Society plan to distribute a new map showing the world distribution of leprosy to every member attending the Sixth International Congress of Leprosy in Madrid in October, 1953.

Urological Research Foundation, Inc.—The American Urological Association recently authorized organization of the American Urological Research Foundation, Inc. The foundation, chartered in Ohio, elected Dr Charles C Higgins, Cleveland, president, Dr Carl F Rusche, Los Angeles, vice president, Dr Thomas D Moore, Memphis, Tenn., secretary, and Dr Reed M Nesbit, Ann Arbor, Mich., treasurer. The foundation is on a nonprofit basis, and all contributions will be used in urological research, except for minimal administrative expenses. The officers and trustees serve without compensation. In addition to an initial donation of \$25,000 authorized by the parent organization, a number of contributions have already been received, and the following grants have been approved by the board of trustees: \$2,500 to Dr Perry B Hudson of Francis Delafield Hospital at Columbia University College of Physicians and Surgeons, New York, for a study of urinary steroid patterns in the postadrenalectomy state, and \$3,850 to Dr Thaddeus S Danowski of the Children's Hospital, University of Pittsburgh School of Medicine, for studies on the renotropic property of growth hormone in chronic renal disease.

Methodist Hall of Fame—Two of the five new members added to the Methodist Hall of Fame in Philanthropy in 1953 are physicians. A total of 26 persons have been thus honored since 1949. At the annual meeting of the National Association of Methodist Hospitals and Homes, this honor was accorded to (1) Dr Malcolm Thomas MacEachern, Chicago, 'Physician, teacher, administrator interested in hospitals and exercising notable influence in the constant lifting of their standards of service—sought after for assistance in problems of curriculum, organization, administration, and generous in response recognized by his colleagues for ability and character as a citizen of the world he has put continents in his debt,' and (2) Dr Watson S Rankin, Charlotte, N C, 'North Carolina State Health officer for 16 years. Trustee, the Duke Endowment, since 1925—director, Hospital and Orphans Sections, The Duke Endowment, 25 years—giving a lifetime of service to the sick, suffering and needy through the administration of assistance by the Duke Endowment to thousands of orphan children without regard to race or creed. A physician administrator without peer, but above all in his living a true interpreter of the Christian religion and a follower of the teachings of the Great Physician.'

Society News—At its recent meeting, the American Ophthalmological Society elected Dr William L Benedict, Rochester, Minn., president, Dr Everett L Goar, Houston, Texas, vice-president, Dr Maynard C Wheeler, New York, secretary, treasurer, and Dr Gordon M Bruce, New York, editor. The American Broncho-Esophagological Association recently elected Dr Edwin N Broyles, Baltimore, president, Dr Leighton F Johnson, Boston, vice president, Dr F Johnson Putney, Philadelphia, secretary, Dr Clyde A Heatly, Rochester, N Y, treasurer, and Dr Francis W Davison, Danville, Pa., editor. At the annual scientific session of the American Dermatological Association in Lake Placid, N Y, Dr Louis A. Brunsting, Rochester, Minn., was elected president, Dr George C Andrews, New York, vice president, Dr J Lamar Callaway, Durham, N C, secretary, and Dr Frank C Combes, New York, treasurer. At the annual meeting of the American Neurological Association in Atlantic City, N J, the following officers were elected: president, Dr Roland P Mackay, Chicago; president-elect, Dr Percival Bailey, Chicago; vice presidents, Drs William G Lennox, Boston, and H Russell Meyers, Iowa City; secretary, treasurer, Dr H Houston

Merritt, New York, and assistant secretary, Dr Charles Rupp, Philadelphia. At the annual convention, the American College of Cardiology installed Dr Robert P Glover, Philadelphia, president, and named Dr Ashton Graybiel, Pensacola, Fla., president-elect, David B Dill, Ph D, U S Army Chemical Center, Md (physiology), Dr Hubert Mann, New York, and John C Krantz Jr, Ph D, Baltimore (pharmacology), vice-presidents, Dr Philip Reichert, New York, secretary, and Dr Seymour Fiske, New York, treasurer. At the annual meeting in New York, the American College of Chest Physicians elected Dr Alvis E Greer, Houston, Texas, president, Dr William A Hudson, Detroit, president-elect, Drs James H Stygall, Indianapolis, and Herman J Moersch, Rochester, Minn., vice presidents, and Dr Charles K Petter, Waukegan, Ill., treasurer.

Prevalence of Poliomyelitis—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States, its territories, and possessions in the weeks ended as indicated:

FOREIGN

Home Fatalities in Britain—According to a current Home Office report, domestic accidents in Britain outnumber traffic fatalities 48,000 road deaths were reported from 1940 to 1949 and 60,000 fatalities as a result of falls, burns, scalds, suffocation, and gas poisoning in the home

Journées Médicales—The societies of general medicine of France, the French Union, and foreign countries are invited to participate in the Journées Médicales, which will be held in Paris, April 21-25, 1954. Request for enrollment should be sent to the Secretariat of the Journées, 12, rue Pierre Geoffroy, Colombes (Seine). Enrollment is free to the participating societies, each of which will be entitled to present a report on a subject of its own choice. The name of the reporter and the subject chosen should be sent to the secretariat before Oct 1. In addition to free communications, one session will be devoted to study and discussion of 'The Prolongation and Improvement of Life by Prophylaxis of Atherosclerosis'.

Congress of Leprosy—The Sixth International Congress of Leprosy will be held in Madrid, Spain, on Oct 3-10. Main subjects for discussion are treatment with new drugs, immunology, revision of classification, and control of leprosy. Titles and short abstracts of papers to be read at the congress should be sent to the general secretary of the organizing committee, Felix Contreras, Moreta 15, Madrid. Abstracts should be limited to 200 to 300 words, papers written by individual persons to 1,500 words, and papers written jointly to 2,000 words. Notice of intention to attend the congress should be sent to the General Secretary, International Leprosy Association, 167 Victoria St., London, S.W. 1, before the end of July. The registration fee for members is \$10 and for non-members \$20, for persons accompanying members who register for attendance at social functions it is \$5.

International Meeting on Military Medicine—The International Committee of Military Medicine and Pharmacy announces that the 16th session of the International Office of Documentation of Military Medicine and Pharmacy will be held in Rome by invitation of the Italian government, Oct. 14-18. All officers of the military, naval, and air health services, active or reserve, are invited to participate. The program will include presentation of reports on the resolutions adopted by the 15th session on (1) international medical law (development of the question) and (2) the international insignia of army health services. The results of international research on the organization of pharmaceutical services in armies, the organization of dental and stomatological services, and female sanitary personnel in armies will be presented. Enrollment should be made before Sept 1. Reduced railroad rates will be available. Information may be obtained from Col. Medecin Prof. A. Campana, secretary of the 16th session of the Office, Ministero della Difesa, Esercito, Rome.

DEATHS IN OTHER COUNTRIES

Dr. Frederick William Edridge Green died April 18, aged 89. He invented the color perception spectrometer and color perception lantern used in the British navy's official color test. He was the Hunterian Professor and the Arris and Gale Lecturer at the Royal College of Surgeons.

CORRECTIONS

Instrument for Continuous Recording of Body Temperature—In the clinical note by this title in THE JOURNAL, June 13, 1953, page 610 the credit line at the bottom of the page should read as follows: From the Department of Surgery, Maimonides Hospital, and the State University of New York, College of Medicine, New York.

Carcinoma of the Stomach—In the last sentence of the article by this title in THE JOURNAL, April 18, 1953, page 1384, the statement is made "The resectability rate increased 48%, the hospital mortality rate decreased to zero, and the five year survival rate increased 20%." The statement that the hospital mortality rate decreased to zero is in error. The fact is that

from 1940 to 1949 there was a 100% improvement in the mortality rate as compared with the patients operated on the period 1907 to 1937, the mortality rate in the earlier period being 16% and that in the later period being 8%.

DEATHS

Lahey, Frank Howard * founder and director of the Lahey Clinic in Boston and a past president of the American Medical Association, died in the New England Baptist Hospital June 27, aged 73. Dr. Lahey was born in Haverhill, Mass., June 1, 1880, and received the degree of doctor of medicine from Harvard Medical School in 1904. He served as surgeon in the Long Island Hospital in 1904-1905 and the Boston City Hospital, 1905-1907, and became resident surgeon of the Haymarket Square Relief Station in 1908. In 1908-1909 and from 1912 to 1915 he was an instructor in surgery at his alma mater, where he was professor of clinical surgery in 1923-1924. He was assistant professor and later professor of surgery at Tufts Medical School from 1913 to 1917. During World War I he served as a major in the U. S. Army Medical Corps and also as director of surgery in the American Expeditionary Forces Evacuation Hospital No. 30. An honorary consultant to the medical department of the U. S. Navy, and during World War II chairman of the Procurement and Assignment Service for Medical Personnel for Armed Forces, he was chairman of the Navy's medical board, inspecting nearly every naval hospital in the states and the Pacific. He was member and past president of the American Association for the Study of Goitre and the New England Surgical Society, member and fellow of the International Surgical Society, fellow and a member of the board of governors of the American College of Surgeons, an honorary fellow of the Royal College of Surgeons, England, a member of the American Surgical Association, Société des Chirurgiens de Paris, Southern Surgical Association, American Urological Association, Theta Delta Chi, and the Association for the Study of Internal Secretions, and a member of the founders group of the American Board of Surgery. He was a member of the American Gastroenterological Association, which in 1946 awarded him the Friedenwald medal for his contributions to surgery of the digestive tract, and on May 10, 1946, he received the Henry Jacob Bigelow medal from the Boston Surgical Society. In the American Medical Association he was appointed by President Jabez N. Jackson at the Washington session in 1927 a member of the Council on Scientific Assembly for a term of five years and was reappointed for a five year term (ending in 1937) by President E. H. Cary at the New Orleans session in 1932. He was appointed by President Irvin Abell at the San Francisco session in 1938 as a member of the Council on Medical Education and Hospitals for a term of seven years and resigned following his election as President of the American Medical Association in 1940. He was also a member of the Advisory Committee to Cooperate with the Bureau of Medical Economics of the American Medical Association Outlining the Necessary Procedure for Making Studies and Reports of the Prevailing Need for Medical and Preventive Medical Service (later called the Committee on Medical Care), which was established by the Board of Trustees at its February, 1938, meeting. He was secretary of the

FRANK HOWARD LAHEY, M.D., 1880-1953

Section on Surgery, 1926-1929, and its chairman, 1929-1930. In 1950 he was elected a member of the Council on National Emergency Medical Service of the American Medical Association, and he resigned in 1952. For some time he was surgeon-in-chief of the New England Deaconess and New England Baptist hospitals and director of surgery in the Lahey Clinic. In addition to many periodical articles, he published the *Lahey Clinic* number of the *Surgical Clinics of North America*. He was a member of the editorial boards of *Surgery, Gynecology and Obstetrics* and of the *New England Journal of Medicine*. He received the honorary degree of doctor of science from Tufts College in 1927, from Boston University in 1943, and from Northwestern University, Evanston, Ill., in 1947. On his 60th birthday Dr. Lahey was given a 466 page book containing scientific papers written in his honor by 50 world medical leaders.

Yeomans, Andrew * Norwich, Vt., born in Chicago Dec. 20, 1907, Harvard Medical School, Boston, 1935, since 1947 assistant professor of clinical medicine at Dartmouth Medical School in Hanover, N. H., research fellow in medicine at his alma mater, 1938-1939, in 1940-1941 instructor in medicine at Tufts Medical School, Boston, where he was associate physician at the Pratt Diagnostic Hospital, associate professor of preventive medicine at Johns Hopkins University School of Medicine and assistant visiting physician at Johns Hopkins Hospital in Baltimore, 1946-1947, specialist certified by the American Board of Internal Medicine, fellow of the American College of Physicians, during World War II served in the U. S. Naval Reserve as clinical director of the U. S. Typhus Commission Research Ward in Cairo, Egypt, chief of the medical service at the VA Hospital in White River Junction, Vt., died in Hanover, N. H., April 17, aged 45, of Hodgkin's disease.

McGrath, John Joseph * Belmar, N. J., born in New York City in 1868, College of Physicians and Surgeons, medical department of Columbia College, New York, 1889, formerly professor of operative surgery at New York Post Graduate Medical School, served as professor of surgery at the New York Polyclinic Medical School and Hospital and the Fordham University School of Medicine in New York, an Associate Fellow of the American Medical Association, fellow of the American College of Surgeons, past president of the board of trustees of the Bellevue and Allied Hospitals, consulting surgeon, New York Polyclinic Medical School and Hospital, Fordham and Columbus hospitals, and Norwalk (Conn.) General Hospital, author of "Operative Surgery for Students and Practitioners", died in the Fitkin Memorial Hospital in Neptune, N. J., May 18, aged 85.

Williams, Ford Smith * Jackson, Miss., born in Jackson Dec. 3, 1910, Louisiana State University School of Medicine, New Orleans, 1934, served with the U. S. Public Health Service during World War II, formerly director of the division of venereal diseases of the Louisiana State Board of Health, of which he was assistant director; at one time director of the West Carroll Parish Health Department in Oak Grove,

La and St. Mary Parish Health Department in Franklin, La., affiliated with Mississippi Baptist and Mississippi State Charity hospitals, died May 22, aged 42, of coronary thrombosis

Achorn, Ralph Chase ♂ Swampscott, Mass., Baltimore Medical College, 1908, died April 24, aged 73, of coronary occlusion

Addison, Robert Perry ♂ Dallas, Texas, Baylor University College of Medicine, Dallas, 1926, member of the American Academy of General Practitioners, died in the Baylor University Hospital May 8, aged 53, of cardiac decompensation and hypertension

Baird, Joseph Shannon ♂ Pittsburgh, University of Pennsylvania School of Medicine, Philadelphia, 1916, assistant professor of pediatrics at University of Pittsburgh School of Medicine, member of the American Academy of Pediatrics, formerly vice president of the Pittsburgh Pediatric Society, superintendent and medical director of the Municipal Hospital, where he died May 2, aged 63, of carcinoma of the head of the pancreas with metastases

Brown, Robert A. ♂ Prague, Okla., Baylor University College of Medicine, 1905, died March 23, aged 81, of coronary occlusion

Brown, William Marmaduke ♂ Lexington, Ky., University of Virginia Department of Medicine, Charlottesville, 1919, member of the American Academy of Orthopedic Surgeons, served with the Kentucky Commission for Crippled Children, formerly affiliated with the Shriners Hospital for Crippled Children, died recently, aged 59

Brust, Herbert Oscar ♂ Syracuse, N. Y., Albany (N. Y.) Medical College, 1897, an Associate Fellow of the American Medical Association, member of the American Academy of Ophthalmology and Otolaryngology formerly on the faculty of Syracuse University College of Medicine vice president of the board of trustees and chief of the ear, nose, and throat department, Crouse Irving Hospital, where he died April 30, aged 81, of arteriosclerosis

Burge, H. Gideon ♂ Nettleton, Ark. (licensed in Arkansas in 1903), died in St. Bernard's Hospital, Jonesboro, April 28, aged 81

Cunningham, Harvey Lee ♂ Cape Girardeau, Mo., Missouri Medical College St. Louis, 1889, an Associate Fellow of the American Medical Association, specialist certified by the American Board of Ophthalmology, died April 26, aged 86, of senility

Daly, Jeremiah James, Andover, Mass., Tufts College Medical School Boston, 1903, served on the board of health died April 19, aged 77 of cerebral hemorrhage

Eisenhardt, William G. ♂ Philadelphia, Jefferson Medical College of Philadelphia 1900, served on the staff of Episcopal Hospital, died April 22, aged 76, of cerebral hemorrhage

Gallagher, Joseph Francis ♂ Col., U. S. Army retired Bradenton, Fla., McGill University Faculty of Medicine, Montreal, Canada, 1914, entered the medical corps of the U. S. Army in September, 1919 served during World Wars I and II, retired Aug. 1, 1945, fellow of the American College of Surgeons, died in Tampa, April 25, aged 63, of emphysema, pulmonary fibrosis, and gastric ulcer

Griot, George Augustus ♂ Springfield, Mo., St. Louis University School of Medicine, 1910, on the staffs of the Burge Hospital and Baptist Hospital where he died April 29, aged 72 of carcinoma of the cecum

Hall, Walter George, Brooklyn, University of Pennsylvania School of Medicine, Philadelphia, 1949, resident, Kings County Hospital died May 18, aged 30, of leukemia

Hammell, Harry H. ♂ Tecumseh, Mich., University of Michigan Homeopathic Medical School, Ann Arbor, 1915, served during World Wars I and II for many years member of the board of education on the staff of the Herrick Memorial Hospital, where he died May 19, aged 59, of coronary occlusion

Headland, Courtenay Inglis ♂ Yonkers, N. Y., Harvard Medical School, Boston, 1926, specialist certified by the American Board of Radiology, member of the American College of Radiology, affiliated with Lawrence Hospital in Bronxville and the Dobbs Ferry (N. Y.) Hospital, on the staff of the Yonkers General Hospital where he died May 26, aged 52, of carcinoma of the soft palate

Jensen, Jens Peter, Plainview, Neb., University of Nebraska College of Medicine, Omaha, 1903, died in the Methodist Hospital, Omaha, April 6, aged 82, of heart failure

Johnson, David Morrison ♂ Columbus, Ohio, Jefferson Medical College of Philadelphia, 1922, specialist certified by the American Board of Otolaryngology, member of the American Academy of Ophthalmology and Otolaryngology, served during World War II, on the staffs of the Children's Hospital and the Grant Hospital, where he died May 14, aged 54, of cancer of the lung

Johnson, Jens Andreas William ♂ Marshalltown, Iowa, University of Michigan Homeopathic Medical School, Ann Arbor, 1917, fellow of the American College of Surgeons, on the staffs of the Evangelical Deaconess and Mercy hospitals, died April 26, aged 67, of a heart attack

Jones, Arthur John ♂ Detroit, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1907, affiliated with East Side General Hospital and St. Joseph's Mercy Hospital, where he died April 22, aged 72, of cerebral thrombosis and hypertensive arteriosclerotic heart disease

Jones, Emlyn ♂ Davidsville, Pa., Jefferson Medical College of Philadelphia, 1900, director of the state bureau of vital statistics, Harrisburg, from 1927 to 1935, for many years practiced in Johnstown, formerly county treasurer of Cambria County, in 1943 named deputy secretary of welfare by the state, serving until about a year ago, for many years coroner's physician, on the staff of Conemaugh Valley Memorial Hospital in Johnstown, died April 17, aged 76

Klock, Guy Almeron, Daytona Beach, Fla., University of Michigan Department of Medicine and Surgery, Ann Arbor, 1906, served on the staff of the Halifax District Hospital, died April 15, aged 77, of cerebral hemorrhage

Le Pard, Sherman J., Jamestown, N. Y., Syracuse University College of Medicine, 1909, died in Winchester (Va.) Memorial Hospital April 3, aged 73, of cerebral thrombosis and hypertensive vascular disease

Lutgen, Anson S. ♂ Colby, Kan., Lincoln Medical College of Corner University, 1904, member of the American Association of Railway Surgeons, for many years practiced in Wayne, Neb., where he was college physician for the Nebraska State Teachers College, and city physician, surgeon for the Chicago, Burlington and Quincy Railroad, on the staff of St. Thomas Hospital, where he died April 23, aged 73, of cerebral hemorrhage

McCracken, Jesse Lazear ♂ Smithfield, Pa., Starling-Ohio Medical College, Columbus, 1911, died in Uniontown May 4, aged 67, of a heart attack

MacDonald, John Joseph, Secaucus, N. J., Yale University School of Medicine, New Haven, 1907, served during World War I, assistant medical director of Hudson County General Hospital served on the staffs of St. Francis and Fairmont hospitals in Jersey City, formerly medical director of the skin clinic at the Medical Center of Jersey City, where he died April 16, aged 80

Mahlatjie, Nathaniel M. S., Detroit, Meharry Medical College, Nashville, Tenn., 1930, died May 1, aged 53

Martin, Pierce ♂ Fourmile, Ky., Kentucky University Medical Department, Louisville, 1904, died March 19, aged 74, of carcinoma of the prostate

Mitchell, Joseph Grover ♂ El Dorado, Ark., Medical Department of Tulane University of Louisiana, New Orleans, 1910, specialist certified by the American Board of Otolaryngology, affiliated with Warner Brown Hospital, died May 3, aged 68, of carcinoma of the colon

GOVERNMENT SERVICES

ARMY

Koreans Grateful for Medical Books—Taegu Medical College officials have shown their gratitude for aid given their institution by the Korean Communications Zone Surgeon by presenting Col. Byron L. Steger (Arlington, Va.) with an engraved scroll and silver tea set. An ovation from hundreds of Korean medical students massed in the college auditorium greeted the colonel, who was soon to leave to attend a course at the Army War College in the United States. Colonel Steger was instrumental in raising funds and equipment for the college. Hard hit by the Korean war economy, the college was at one time struggling along without textbooks and proper teaching facilities. Now the institution's library numbers professional books in the hundreds and has general surgical equipment. Its students and faculty receive refresher courses in English from Army physicians stationed in the KComZ Medical Section (THE JOURNAL Jan. 24, 1953, page 319).

NAVY

Admiral Groesbeck Retires and Goes to Indiana—Rear Adm. Leslie O. Stone (MC) assumed command of the National Naval Medical Center, Bethesda, Md., on June 30, on the retirement of the then commanding officer, Rear Adm. Bertram Groesbeck Jr. Admiral Groesbeck's retirement followed more than 35 years of continuous active naval service. Immediately following his retirement, Admiral Groesbeck took up new duties in civil life as director of the department of public health of the state of Indiana, with headquarters at Indianapolis. He received the 1951 Lyster Award, which is presented annually by the Aero Medical Association for outstanding achievements in aviation medicine. He recently was presented with the 1952 Good Government Award of the Bethesda Junior Chamber of Commerce and the Alumni Achievement Award of George Washington University for 1953.

PUBLIC HEALTH SERVICE

Federal Grants and Fellowships—The United States Public Health Service announces that, beginning July 1, applications for postdoctoral and special research fellowships in the field of mental health, as well as in other health fields, will be reviewed twice rather than three times annually. Such applications should be submitted before Oct. 15 or Feb. 15. Awards will be announced about three months later. Research grant applications will continue to be reviewed three times a year, with the following closing dates for the coming year: Aug. 15, Nov. 1, and March 1. Awards will be announced from four to five months after the closing dates. Further information and application forms may be secured from John C. Eberhart, Ph.D., Chief, Research Grants and Fellowships Branch, National Institute of Mental Health, Bethesda 14, Md.

Radiological Health Training Program—Short courses in radiological health are being presented by the Public Health Service at the Environmental Health Center in Cincinnati. These courses are tuition free and are designed primarily to provide professional personnel working in health departments and other organizations with a working knowledge of the health hazards associated with radiation. Candidates should have a degree in medicine, engineering or science (physical or biological). Instruction is given in radiation physics sufficient for an understanding of the problems arising from use of ionizing radiation. Laboratory and lecture periods are pre-

sented covering the hazards and methods of alleviating these hazards, as encountered in employment of x-rays, radioisotopes, neutron fluxes, and particle accelerators.

Courses are two weeks in length. Basic courses, which stress basic radiation physics and survey techniques, will be presented on the following dates: Oct. 5-16, 1953; Jan. 11-22, 1954, and May 3-14, 1954. The basic course or its equivalent is a prerequisite for the intermediate course. Laboratory assay of radioelements and x-ray survey techniques are emphasized in the intermediate course, which will be presented on the following dates: Oct. 19-30, 1953; Jan. 25-Feb. 5, 1954, and May 17-28, 1954. Completion of the intermediate course or its equivalent is a prerequisite for admission to the advanced course. This course, for professional personnel concerned in particular with occupational health problems, will be presented on Feb. 8-19, 1954. Information may be obtained by writing to the Radiological Health Training Section, Public Health Service, Environmental Health Center, Cincinnati, Ohio.

Increase in Annual Birth Rate—The national birth total set a new annual record of 3,889,000 births in 1952, according to statistical estimates released by the Public Health Service. Births during the first quarter of 1953 were running about 29,000 ahead of the same period last year. March was the 10th consecutive month in which the estimated total births topped corresponding monthly figures for the previous year. The level of births for the first three months is at an annual rate of 25 live births per 1,000 population.

Based on registered births alone, 58,000 more couples had a first child in 1951 than in 1950, according to preliminary estimates. This 5% increase in first born children was largely a sequel to the marriage upswing that began in June, 1950, at the start of the Korean War. Births of second born children increased by 2% over 1950. Births of third children increased by 9%, and of fourth children by 13%. These increases continue a steady rise that has been going on since the end of World War II.

Hospital News—The U. S. P. H. S. Hospital at Fort Stanton, New Mexico, has stopped admitting patients; the Public Health Service announced June 1. The hospital, a tuberculosis sanatorium, will be closed as soon as patients now being treated there are transferred to other Service hospitals. The closure is necessary because of the curtailment of operating funds for the P. H. S. hospitals. In addition to the reduction in direct appropriations for the medical care of its beneficiaries, the Service will also lose reimbursements from the Veterans Administration for a daily average of 375 patients being cared for in general and tuberculosis hospitals. Some of the beds vacated through the withdrawal of veteran patients will be made available for tuberculosis patients. Patients from Fort Stanton will be cared for in the Public Health Service general hospitals at San Francisco, Seattle, New Orleans and Chicago, and the tuberculosis sanatorium in Brooklyn. Persons eligible for medical care by the Public Health Service include merchant seamen, Coast Guardsmen, and federal employees stricken in line of duty.

VETERANS ADMINISTRATION

Residencies in Pathology in Texas Hospital—The VA Hospital Houston, Texas, has vacancies for residents in pathology. The residency is approved for four years training in pathological anatomy and clinical pathology. The activities of the service are closely integrated with those of the departments of pathology, microbiology, and biochemistry of Baylor University College of Medicine. Stipends range from \$2,640 to \$3,300 per annum. Interested candidates should write to Dr. Lee D. Cady, Manager, Veterans Administration Hospital, Houston, Texas.

FOREIGN LETTERS

COLOMBIA

Yellow Fever—Dr Augusto Gast Galvis, director of the Carlos Finlay Instituto de Estudios Especiales of Bogotá, published an article on the epidemiology of yellow fever in the last four years in Colombia. The article appeared in *Revista de la Facultad de Medicina de Colombia* for December, 1952. The résumé of the work on which the article was based was reported by the author to the First Congress of Inter American Hygiene in Havana, Cuba, Sept 26 to Oct 1, 1952. The campaign against yellow fever in Colombia is carried on by the Carlos Finlay Institute. The institute is supported by the Ministry of Hygiene of Colombia, with the cooperation of the Pan American Sanitary Office of Washington. The work carried on in the country for several years by Colombian researchers, with the support of the national government, the Rockefeller Foundation and the Pan American Sanitary Office, has been of great value in the continental crusade against yellow fever. Drs R Franco, J Martinez Santamaría, and Gabriel Toro Villa in their research on the 1911 epidemics in the Muzo region described jungle yellow fever for the first time. Later further studies were carried on by Colombian researchers, mainly Drs R Serpa, L Patiño-Camargo, J Boshell Manrique, A Gast-Galvis, E Osorno Mesa, and M Roca-Garcia, alone or with the collaboration of distinguished foreign scientists mainly Drs A Peña Chavarria, G Bevier, J A Kerr, J C Bugher, H W Kumm, M Battes, and C R Anderson.

In Colombia, the last urban epidemics of yellow fever transmitted by *Aedes aegypti* occurred in Bucaramanga and Socorro in 1923 and 1929. In September and October, 1937, however, a small outbreak occurred in the Buenavista village (Caldas). It is difficult to ascertain whether *Aedes aegypti* or *Haemagogus spegazzinii* falco was the transmitting agent. The latter is abundant in the jungle near the village. From that year on, according to Dr Gast Galvis, only the rural or jungle type of yellow fever has occurred. Generally the disease is endemic, with small epidemic outbreaks. The endemic foci are relatively far from the coastal zones on both oceans. They occur in the mountainous zones of the interior of the country and, with preference for the hilly zones near the valleys, at altitudes between sea level and 1,600 m above sea level. The majority of well known foci are at altitudes of between 400 and 800 m above sea level. Single cases of yellow fever that occurred simultaneously in several regions of the country were revealed by viscerotomy studies of the liver of persons who died after an illness of 10 days' duration. In the regions of tropical jungle in which cases of yellow fever have occurred there are many apes. In other endemic foci in which the primitive jungle was destroyed and colonization established, simian apes are scarce but marsupials are abundant. The role of marsupials in the epidemiology of yellow fever has been proved by serologic studies. There are eight species of *Haemagogus* mosquitos in the country. It has been proved that only *Haemagogus spegazzinii* falco is a capable vector in nature. It is observed in all places in which yellow fever in human beings occurred. The data of the department of viscerotomy of the Carlos Finlay Institute showed, as revealed by examination of more than 34,000 specimens of human livers taken by viscerotomy, that yellow fever is more frequent in males than in females after the age of 10 years. This is particularly true in adults between the ages of 20 and 29 years. This seems to be natural, because the studies were made on cadavers of rural persons among whom only the men work in the jungle and consequently are more exposed than women to the disease. Between 1935 and 1951 the virus of yellow fever was identified from 26 different persons. The total number of cases of yellow fever, as proved by the results of studies of the liver between 1934 and 1952, was 525. Its frequency indicates that the disease occurs in

cycles with a periodic increase in the number of cases nearly every four or six years. The greatest and smallest numbers of cases were reported in 1947 and 1949, with 77 and 3 cases respectively. In the last four years, 53 proved cases of yellow fever have been reported from already known endemic regions. The disease has disappeared in human beings in places with small changes in the population where a constant vaccination program has been maintained. This has been the case in the Muzo municipality, in which no cases have occurred since 1948, whereas for 40 consecutive years before 1948 the disease appeared frequently.

Personal.—Dr G Pittaluga of the Instituto Carlos Finlay of Havana, Cuba, came to Bogotá in answer to the invitation of the Ministry of National Education the second week of December, 1952. He gave interesting lectures on "Diseases of Blood,"

"Diseases of the Reticuloendothelial System," and "Psychology of Women."—Dr R D Adams, neurologist of the Massachusetts General Hospital, visited Bogotá during the first two weeks of March in answer to an invitation of the Sociedad Colombiana de Medicina Interna. He gave a course of neurology that included theoretical lectures and practical sessions in hospitals.

LONDON

Irish Physicians' Disapproval of "White Paper"—An editorial in the Irish Medical Association's journal says that Irish physicians' disapproval of the "White Paper" on improved health services has been confirmed by the pronouncements of Dr James Ryan, Minister of Health. Headed, "Why We Disapprove," the editorial challenges Dr Ryan to explain how, with a bare 1,500 maternity beds at his disposal, he will fulfill the promise of skilled professional attendance to the mothers of 65,000 babies born annually in the republic. Quoting the 1,120 million dollar bill of the British health services, the editorial says: "Stage by stage in Britain, notwithstanding her centuries of experience in treasury work, there has been gross miscalculation. In this smaller, poorer country, can the taxpayers and ratepayers face with equanimity the prospect of similar miscalculation at a time when the purchasing power of the pound has been officially quoted in the *Dail* at \$1.25?"

Replacement of Dentures—The Denbighshire and Flintshire Executive Council has had problems in connection with claims for replacement of dentures. The council decided that a man who left his teeth in a tumbler on a dressing table, where they were seized and chewed by a dog that came through the window, had shown lack of care and would have to pay for a replacement. A man who said his denture fell into the fire while he was showing it to his wife and two persons who lost their false teeth while bathing will also have to pay. A woman whose denture broke in two while she was chewing an apple will get a free replacement but a man whose upper denture snapped while he was eating a meal and who tried to repair it himself will not.

Cystic Disease of Breast—Patey and Nurick of the Middlesex Hospital, reporting in the *British Medical Journal* (115 [Jan 3] 1953), have been investigating a series of cases of breast disease. Among 535 consecutive cases there were 76 cases of cystic disease, which were treated conservatively, 65 of these were followed for from 1 to 16 years. In only one is carcinoma known to have developed, and that in the opposite breast. Sixty four patients were treated by aspiration of the cyst and it was realized that this is not necessarily followed by the development of further cysts, and also that the tendency to cyst formation may disappear. It is suggested that, with simple precautions, conservative treatment by aspiration is an efficient and safe treatment for cystic disease of the breast.

Economy in Manpower in Hospitals.—The Ministry of Health has issued a memorandum stressing the need for economy in hospital administration costs and asks boards and committees to review their staffs and achieve reductions wherever possible. It also requires them to obtain approval before increasing the total number of staff members employed. The largest single item in hospital budgets is expenditure on the salaries and wages of staff, and, in an effort to prevent the annual cost of the National Health Service from exceeding the ceiling figure of 1,120 million dollars each year, the first attack on the individual items of expenditure is made on the staff. Speaking in the House of Commons, Miss Hornsby Smith, under secretary to the Ministry of Health, said that it was essential that progress should be made, in view of the disparity between the staffing of hospitals. It was aimed to get the staff where they were most needed. Recently there had been remarkable successes in reorganization of duties, in installation of more equipment and labor saving devices, and in discontinuance of unessential work.

This memorandum did not propose any target for the reduction of any medical or nursing staffs, nor did it impose control over individual appointments. Vacancies would be filled as an ordinary matter of routine. But increases in total number of staff members had to be justified. When one realized that 65% of the 630 million dollars spent on the hospital services alone were used for salaries and wages of hospital staffs, it was absurd to think of any review of the finance of the National Health Service if this vast field of expenditure was to be ignored. As far as manpower was concerned, in 1951 there were 15% more full time staff members and 33% more part-time staff members than in 1948. The Ministry must be satisfied that there was no waste of national manpower.

Figuring Radiological Work in Units.—Circular 94121/1/14, issued by the Ministry of Health on Dec 23, 1952, begins as follows: "This memorandum sets out a new method of recording the work undertaken in diagnostic X ray departments, which will come into use on 1st January, 1953." Many radiologists take strong objection to this, because again the Ministry of Health appears not to have sought cooperation and agreement with the profession. Three years ago the Nuffield Provincial Hospitals Trust looked into methods of estimating the work done in hospital radiodiagnostic departments. A subcommittee of the British Medical Association's Radiologists Group Committee joined with the trust in this inquiry, and it was decided to try out in 1952 the 'unit' system, which is the subject of the Ministry of Health edict. It was arranged that at the end of 1952 the Radiologists Group Committee should receive a report on how the system had worked, so that it could consider its worth and possible modifications. Instead, this circular was distributed on the unit system of estimating work done in diagnostic roentgenographic departments. Apparently the Ministry had taken this scheme from the Nuffield Trust, which had had it from the Radiologists Group Committee, and went into print with it without any consultation with the B. M. A. or its group committee. Quoting from a recent leading article on the Ministry's unilateralism, "This is an excellent example of how not to do things." Those responsible for the work of diagnostic roentgenographic departments will have every justification in refusing to obey the instruction in the circular.

In regard to the system itself, one unit is given for "gall bladder, Plain," 2 units for "urinary tract, plain," or 8 units for "Smith Petersen pin, insertion of and similar procedures." At the end of the year the units will be added up, and then calculated in terms of radiologists and their technical assistants, no doubt also in units. Apparently the system, in its trial period, has worked satisfactorily in some hospitals. But the criticisms against it by Dr J. W. Bull have great validity, and he speaks with the authority of the man doing the job. There is, he points out, all the difference between roentgenographing the spine of a slim adult and that of an obese, incontinent, and paraplegic patient lying in plaster. The time taken for a ventriculography (10 units) may vary from 10 minutes to two hours. In short, human beings just will not fit into a ministerial sliding scale. And in the background

to all this there is an element of distrust, it seems that the Ministry cannot trust hospital staffs to do their work with a sense of responsibility, and not to ask for more staff than is necessary. If medical men are instructed by the Ministry that roentgenographing "spine, more than one area" is worth only four units of work, there is a suggestion that, following the example of the bricklayer, they will end up by laying down their tools on the completion of the fourth unit. Is this really medicine in Britain today? It is to be hoped that the Ministry of Health will have second thoughts.

Lord Horder and the Health Service.—In a series of three Harben lectures at the Royal Institute of Public Health and Hygiene, Lord Horder has spoken critically of the National Health Service. In its creation two fundamental errors have been made. One was its overnight introduction, and the other was the attempt to do too much in too short a time. The medical profession had pleaded for progress by evolution, but in vain. Had the service been introduced in two steps and a reasonable pause allowed for consolidation, many of the defects of the present scheme might have been avoided. The first step should have been the regionalization of the hospitals, with grants in aid administered locally, and the second the addition of workers' dependents to the national health insurance service that had been in operation since 1911. The new service was based primarily on the hospital and not on the family physician. This was the negation of adequate medical care, which was an integration of the family physician, the hospital, and the consultant. Such an integration to be effective could be attained only by development within the profession, it could not be dictated by the state. The general practitioner was finding his time increasingly taken up with other problems. Even after four years of the service, health centers were almost non-existent, and there was less postgraduate instruction. More serious still was the fact that the relationship between physician and patient, which was the essential of successful medical care, was grossly interrupted. The government had been unable to do anything about the fantastic disparity between budget and expenditure, and the National Health Service was becoming financially insecure.

Lord Horder was equally outspoken in his criticism of social medicine as a specialty. "Humanist though I am, and wholehearted supporter of the thesis that medicine should be made 100 per cent available to the people, I have never been quite convinced that the notion underlying the new branch of it which has been called 'social medicine' has justified itself." The claims made for social medicine seem to fall well within the orbit of general medicine. The importance of knowing all about the patient's social, domestic, and employment background had always been recognized by sound clinicians, but to make such inquiries a special branch of medicine seemed redundant.

NORWAY

Treatment of Speech Defects.—The Granhaug School for combating defects of speech was founded in 1919 by Hans Eng, who remained its director till his death in 1939. It is a boarding school with accommodation for 21 pupils and a few day boarders. The age limit for pupils is 7 to 25 years, and the demand for admission has exceeded the supply to such an extent that applicants have had to wait five to six years. It was therefore obvious that this national school must be enlarged, and in 1946 a site was acquired by the state for the erection of a new school. Temporary quarters have meanwhile been provided for some 30 pupils, and in the autumn of 1952 a boarding house was acquired for the accommodation of 36 pupils classified in three age groups. Some 100 pupils can now be accommodated by this school every year for courses of training lasting several months. Meanwhile the original Granhaug School continues to deal with speech defects associated with cleft palate, general disturbances of speech, deaf mutism, delayed development of speech, word blindness, and functional disturbances of speech. Attached to the school are specialists in plastic surgery, dentists, and ear, nose, and throat specialists. Approximately half of the pupils

suffer from defects of speech due to cleft palate, and most of them require at least a year's training, in some cases up to two years

In such a vast and thinly populated country as Norway the treatment of speech defects cannot be limited to a few central schools and it would be absurd to send a lisping child from the North to the South of Norway for treatment. Schools like Granhaug must therefore be devoted to more serious cases, cleft palate cases for example, while an elastic system must be devised for local or ambulatory treatment. In recognition of this principle a state-controlled scheme was devised in 1946 for the training of speech pedagogues or logopeds. Norway is one of the few countries in the world with a team of fully trained logopeds who must present evidence of a comparatively high scholastic attainment in order to qualify for training as a logoped. The one year training period is carried out partly at the Granhaug School and partly at the University of Oslo. Ultimately a training of two years will be necessary. More than two score logopeds have already been trained, and nearly all of them also hold certificates as school teachers. Ultimately every administrative district in Norway will have its own logoped trained to distinguish between the various defects of speech, to give treatment in suitable cases, or to recommend the patient for treatment in a special school. He will be able to help adults who because of laryngectomy or some other handicap have to train themselves again to speak, and who have hitherto been much at the mercy of amateurs at home or have had to go abroad for help. Norwegian logopeds have already formed their own professional body known as the Norwegian Logoped Association to promote the welfare of its members and the patients in their care. The address of this body is Postboks 210, Lysaker, Norway.

BCG Studies.—At the Glitre Sanatorium, under the charge of Dr Rolv Høyer Dahl, there are already ample opportunities for studying the behavior of pulmonary tuberculosis in persons previously vaccinated with BCG, for BCG vaccination has been in force in Norway for many years. Between Jan 1, 1948, and April 1, 1952, 64 of the patients resident in this sanatorium had been vaccinated with BCG. All the 64, who constituted approximately 5% of all the patients treated during this period, were adults, the oldest being nearly 50 years old. The disease was of the destructive type in 52 of these cases and of the nondestructive type in 12. Most of the patients had been vaccinated between the ages of 15 and 30 several years before admission to the sanatorium. Among the 64 were 6 nurses, who had been exposed to infection after vaccination and had been kept under close tuberculin supervision.

In his comments on these cases in the organ of the Norwegian Medical Association, *Tidsskrift for den norske lægeforening* (110 [Jan 1] 1953), Dr Sigmund Bøyum draws special attention to the patients who had remained tuberculin-negative after several BCG vaccinations. Failure to respond to BCG with a positive tuberculin reaction is, in his opinion, by no means a sign indicative of good resistance to the tubercle bacillus, as is believed in certain quarters. Nearly all the patients who had remained tuberculin negative after BCG vaccination and in whom pulmonary tuberculosis subsequently developed belonged to families in which there was much tuberculosis. It seems to Dr Bøyum that successive BCG vaccinations at short intervals may defeat their object, for a faint response on the first occasion, with an infiltration of only 1 or 2 mm., may block the spread of BCG in the organism when vaccination is repeated after a short interval.

Another BCG study comes from the central BCG laboratory in Bergen under the charge of Dr J. Bøe. He is concerned over the deterioration of BCG under the influence of sunlight, a problem now being investigated in many BCG laboratories. While some authorities believe that variations in the potency of BCG depend chiefly on the influence of sunlight, Dr Bøe does not go so far and he believes that the potency of different samples of BCG will continue to vary, however effective the precautions taken against sunlight may be. He does not follow the example of the Danish and Swedish BCG laboratories which now send out BCG in ampuls colored red on the assumption that red light is the least harm-

ful to BCG. But in recent months he has enclosed in each consignment of BCG a short notice to the effect that it should be kept in the dark and preferably cool. The vaccine must not be left to stand in the window nor in a syringe for any length of time.

Death of Prof. Johan Holst.—The death of Prof. Johan Holst early in 1953 came as a great surprise to his many friends, since this alert, athletic, 60 year-old surgeon passed away only a week or two after he had been at work. He came of medical stock, and his father, Peter F. Holst, was professor of medicine at the University of Oslo. Quite early in his career, Johan Holst undertook special studies of the diseases of the thyroid gland, and it was his investigation of the pathogenesis of Graves' disease that earned him the degree of doctor of medicine in 1924. Thereafter his activities were, for the most part, surgical, and his surgery of the thorax, with special reference to pulmonary tuberculosis, earned him an international reputation. He was only 38 years old when appointed professor of surgery at the University of Oslo and was put in charge of the surgical department A of the Rikshospital. His wartime activities date as far back as to 1918, when as a young physician he took part in Finland's Liberation War. When Finland was again at war in 1939, Holst organized the Norwegian Ambulance Service sent to Finland. When war broke out in Norway in 1940, Holst was at once put in charge of the Norwegian Army Medical Service, and he remained at the head of it till the end of the war. He escaped from Norway during the war under dramatic circumstances and thenceforth worked abroad with the Norwegian forces serving in England and elsewhere. The honorary degree conferred on him by the University of Glasgow was one of the many tokens of the high esteem in which he was held abroad as well as at home.

SWITZERLAND

Medical Insurance.—On Dec 31, 1950, in Switzerland 3,083,108 persons were insured by a recognized sick fund. Included were 1,267,792 men, 1,179,970 women, and 635,346 children. This represented 65.6% of the total population of the country and an increase of 1.1% (89,537 persons) compared with 1949. In certain cantons, where the insurance is obligatory, there are 85 to 99% of persons insured. In the cantons where the insurance is not obligatory, there are 36 to 48% insured persons. Most of the insured persons benefit from the provisions for medical and pharmaceutical expenses only, or in combination with a daily indemnity. In 1949 the receipts of the recognized sick funds involved 261 million francs, which were distributed as follows: contribution of the members 205 million, payment of the public powers 38 million and contributions of the employers 5,800,000 francs. The federal subsidies reached about 28 million francs, including subsidies to the tuberculosis insurance. The expenses reached 246 million francs and were broken down as follows: daily indemnities 58 million, medical and pharmaceutical expenses 142 million, accouchement 9 million, administration expenses 24,500,000 and indemnity at death 1,224,000.

Control of Tuberculosis.—In 1902 the central commission for the control of tuberculosis was created in Switzerland. This commission developed the idea of constructing the first popular sanatoriums. Chiefly under the presidency of Dr E. Bachmann, from 1924 to 1948, the Swiss Association for the Control of Tuberculosis endeavored to prepare federal legislation on tuberculosis, it became the connecting link between the confederation and the cantons, and it accomplished much to the satisfaction of everybody. Recently, the association celebrated its 50th anniversary, in the presence of civil and medical authorities. The minister of public health, Mr Etter, declared that 50 years ago 15% of the total number of deaths was attributed to tuberculosis, while in 1950 this had been reduced to 3.5%. Prof. E. Bernard, from Paris, general secretary of the International Union Against Tuberculosis, spoke in praise of this fight against tuberculosis, especially the creation of sanatoriums and preventorium.

CORRESPONDENCE

HEPARIN AND ANGINA PECTORIS

To the Editor—Dr Hyman Engelberg discussed our article on heparin and angina and made several statements that require amplification (*JAMA* 152:474 [May 30] 1953). His statement that "nearly all" of our patients had had angina for five years is inaccurate. In our article, we stated that this was true of the "majority" (over 50%). His statement that angina of this duration would be associated with "probably markedly calcific vessels" must remain a surmise, in the absence of anatomic confirmation. We are surprised that he considers angina of this duration a disqualifying feature, since he reported on 27 patients (*Am J Med Sci* 224:487, 1952), 12 of whom had had angina for four or more years. He reported improvement with heparin in 7 (58%) of these 12 patients and in 10 (66%) of the remaining 15 patients. The difference has no statistical validity and does not support the concept that this duration of angina is a critical factor.

Dr Engelberg makes the unqualified generalization that domiciliary patients are resistant to therapy because their security is threatened by any considerable improvement in symptoms. This has no basis in fact and is contrary to our personal experience with the medical program for domiciliary patients at this center. It ignores the fact that 22 (65%) of our 34 patients improved with intravenous therapy (heparin and sodium chloride solution placebo). This is almost identical to Dr Engelberg's report of improvement, with heparin, in 17 (63%) of 27 patients. Dr Engelberg attributes this improvement solely to heparin, while we, utilizing the double blind control, found that sodium chloride solution placebos were equally as effective as heparin. Dr Engelberg suggests that heparin has a gradual delayed response and a prolonged carry-over when used in the treatment of angina pectoris. This theory, to our knowledge, has not been confirmed by any other investigator. It is not in accord with the original findings of Graham and co-workers (*Circulation* 4:666, 1951), who first reported beneficial effects of heparin in angina. They found that heparin produced relief of angina soon after heparin therapy was begun, usually after the first few injections, and that relief persisted for several days after a single injection. All of seven patients whose severe angina had been relieved by heparin injections complained of return of anginal symptoms when sodium chloride solution placebos were injected instead of heparin.

It is of interest that five other groups of investigators found, as we did, that heparin has no significant effect on the symptomatic relief of angina (Russek, Urbach, and Doerner and Miller, Zinn, and Griffith in 1952 and Grüner and co-workers, Rinzler and co-workers, and Port and co-workers in 1953). Heparin therapy was given for 6 weeks by Miller, Zinn, and Griffith, for 7 to 11 weeks by Grüner and co-workers, for 8 to 11 weeks by Rinzler and co-workers, and for two separate 10 week periods by Port and co-workers. In each instance, placebo therapy was given for about the same length of time as heparin therapy. None of the investigators detected a gradual response to heparin or a prolonged carry-over. We agree with Dr Engelberg that "conscious and unconscious emotional factors" are extremely important in evaluating the response of angina to any drug. For this reason, we advocate the use of the double blind method so that enthusiasm or lack of it, on the part of the physician as well as the patient, will be properly controlled.

CHEMICALLY TREATED FLOUR

To the Editor—In *THE JOURNAL* (152:353 [May 23] 1953), there was a note concerning the report of a case in the *Lancet* (1:577, 1953) in which eczema, mental depression, and anorexia "associated with the ingestion of chemically treated flour" developed. The authors concluded, after presenting their findings, that the patient showed an allergic response to wheat flour treated with nitrogen trichloride or chlorine dioxide. In addition, they asked whether "this is a rare case of allergy or merely the first recognition of a common disorder." In 1949, I published a paper on the "Species Specificity of Agene Toxicity" in the *Journal of Applied Physiology* (p. 802) and reported that the ingestion over a period of time of over one half of the initial body weight of bread and cookies made with wheat flour that had been very heavily treated with nitrogen trichloride (Agene) had no ill effect on three patients with epilepsy. No demonstrable changes could be detected in the electroencephalogram, various blood, urinary, and spinal fluid biochemical determinations, and psychological, psychiatric, nutritional or neurological status. The patients gained much weight and were very happy in the hospital. No skin disorders were observed. These same patients were fed a control diet before and after the experimental diet; the control diet was identical to the experimental diet except that it included unbleached flour. Several months after the experiment, the patients expressed a desire for the "cookies" they had previously been fed. Other investigators have also reported no demonstrable toxic effects from the ingestion of flour treated with nitrogen trichloride. In my experiments, identical control and experimental flour was tested on dogs, cats, and monkeys. It was found that after one feeding of the experimental diet severe signs of toxicity developed in the dogs within 18 hours, (tremors, convulsions, and typical electroencephalogram records). If allowed to feed again, they died in status epilepticus within 24 hours. This discrepancy in toxicity has been explained recently by Reiner and his co-workers. Apparently the nitrogen trichloride acts on the amino acid methionine found in wheat flour to produce methionine sulfoximine. This substance when accumulated, produces toxic symptoms. It is not readily excreted via the kidney in dogs, but man has no difficulty in eliminating it. This explains the difference in species response. On the basis of these facts, I feel the report by the British authors is not one of a new syndrome but one of a rare allergy. I want to indicate, however, that my experiments were limited in that only flour treated with nitrogen trichloride was used.

UNUSUAL VIRUS FROM POLIOMYELITIC SPINAL CORD

To the Editor—We have recently isolated, from the spinal cord of a child with typical clinical and histological poliomyelitis, a filterable agent (Kentucky virus) that is not related immunologically to the three standard types of poliomyelitis. Human immune globulin neutralizes Kentucky virus in high titer. To date, all positive results with this virus have been achieved only in tissue culture. The Kentucky virus was obtained from the spinal cord of a child 18 days after onset of illness, a time at which the recovery of poliomyelitis virus is difficult because of the very small amounts of virus then present. The thalamus of each of two monkeys was inoculated with the human spinal cord suspension; both animals remained well and free of lesions. The virus was probably present in very low titer since only one of three attempts yielded the

agent producing cytopathology After passage in vitro, the titer of the virus, revealed by fibroblastic degeneration, is 10^3 to 10^4 it is destroyed in 30 minutes at 56 C, is ether resistant, and has not affected suckling or adult mice, guinea pigs, hamsters or three monkeys

Although one virus type usually dominates during a poliomyelitis epidemic, the other types have been found at the same time in other patients In the 1952 Louisville poliomyelitis epidemic during which the Kentucky virus was isolated, the attack rate was 149 per 100,000 persons and the poliomyelitis virus strain recovered was type 1 One possible although not solitary explanation for the presence of Kentucky virus in the spinal cord of a patient who died of poliomyelitis is a causal rather than a casual relationship If other laboratories recover immunologically related viruses from the spinal cord of poliomyelitis patients, the existence in humans of a hitherto unrecognized immunologic type of poliomyelitis virus important in epidemics and in active immunization against the disease would require assessment We believe it advisable to make these findings known at this time so that full opportunity is taken in the ensuing poliomyelitis season to inspect spinal cord material from persons who die of the disease

LUMBAR SYMPATHETIC BLOCKS AND ANTICOAGULANT THERAPY

To the Editor—In THE JOURNAL (May 30, 1953) there was an article entitled "Danger of Lumbar Sympathetic Blocks During Anticoagulant Therapy" by Robert P Hohf, William S Dye, and Ormand C Julian The authors reported retroperitoneal hemorrhage following paravertebral lumbar sympathetic block during anticoagulant therapy in three patients with peripheral vasospasm In their comment they state, "It is apparent that there is no way to avoid this catastrophe by modifying the technique by which a block is performed or by regulating the therapeutic dose of anticoagulants It has been shown that adequate lumbar sympathetic block may be obtained by the injection of dilute solutions of local anesthetics into the epidural space (Ruben, J E *Anesth & Analg* 29 296, 1950) This space may be entered for the purpose by the caudal or the interspinous route A flexible needle (Hingson, R A., and Southworth, J L *Mil Surgeon* 100 474, 1947) or a plastic or nylon catheter (Ruben, J E *Ann Surg* 131 194, 1950) may be placed in the epidural space through the sacral hiatus for continuous lumbar sympathetic block by this method The arrangement for continuous block prior to the induction of anticoagulant therapy has proved perfectly safe and very satisfactory for more than five years The benefit of lumbar sympathetic block need not be denied the patient with vasospasm who is receiving anticoagulants

SURGEON'S HELPER

To the Editor—Any instrument, particularly a simple and inexpensive one that aids or expedites a surgical procedure is worthy of note The surgeon's helper is such an instrument, it might even be called a seeker This little instrument contains a powerful patented magnet not so large as a conventional needle holder It is entirely self-contained and has no batteries or connections It withstands repeated boiling and autoclaving without apparent loss of magnetic power The instrument consists of a simple cartridge measuring 7 mm by

6 cm with the magnetic button on one end A milled handle 15 cm long is hinged to the cartridge to permit the greatest flexibility in gaining access to remote places The milled handle also provides a good grip

The surgeon's helper has a broad scope of usefulness When looking for a broken needle, a needle eye, metal clips, or small pieces of steel wire, all one must do is pass the magnet through the surgical field or drapes, the instrument immediately picks up the metal objects It saves a great deal of time and patience particularly when one is looking for broken needles This little magnet may be purchased at any automotive supply store for less than a dollar It is also available in larger sizes

SNAKE VENOM POISONING

To the Editor—In their article "Treatment of Snake Venom Poisoning with Cortisone and Corticotropin" (*J A M A* 152 236 [May 16] 1953), Hoback and Green reported that in two cases the bite was from a 'copperhead moccasin' To avoid confusion, I believe this should be clarified The snake involved undoubtedly was either a copperhead (*Agkistrodon mokasen*) or a water moccasin (*Agkistrodon piscivorus*) To my knowledge there is no such creature as a 'copperhead moccasin' Both the moccasin (water or cottonmouth) and copperhead belong to the family Viperidae (pit vipers)

EFOCAINE

To the Editor—Many favorable and a few unfavorable reports regarding the use of Efoaine in nerve block anesthesia have been published Efoaine is a solution containing 1% procaine, 0.25% procaine hydrochloride, and 5% butyl-p-aminobenzoate in a solvent composed of 2% polyethylene glycol 300, 78% propylene glycol, and water We wish to state that, although recent reports by ourselves and others have been favorable regarding the use of Efoaine for long lasting local anesthesia, late postoperative examination of patients who have received nerve block shows a not infrequent incidence of pain at the site of injection and, occasionally, in the nerve distribution Because of these complications, we have discontinued the use of Efoaine because we believe that in its present form, it is an unsatisfactory medicament for this purpose

MILKER'S NODULES

To the Editor—I noted with interest the editorial on milker's nodules in the May 2, 1953, issue of THE JOURNAL While there have been very few cases in the country, there was at least one in New England I discussed that case and showed a very good photograph of the nodules when I presented a paper, "Criteria for Diagnosis of Occupational Skin Diseases" in Ohio The paper was published later (*Ohio State M J* 36 937 [Sept] 1940) I think it was excellent that the disease was described in an editorial, because I imagine that more cases have been seen than have been reported in the literature

MEDICAL MOTION PICTURES

Subtotal Gastrectomy for Duodenal Ulcer Perforating Into the Pancreas 16 mm color sound showing time 29 minutes Prepared by Joel W Baker MD the Mason Clinic Seattle Produced in 1951 by and procurable on loan from Davis & Geck Inc 57 Willoughby St. Brooklyn 1

The author has illustrated his technique of doing a subtotal gastrectomy for perforated ulcer of the duodenum without removing the ulcer He has demonstrated a posterior Hofmeister-Polya type of resection He isolated the duodenum first and cut across the duodenum, leaving the ulcer, which had perforated into the pancreas The duodenal stump was closed with interrupted nonabsorbable surgical sutures and the stump covered with omentum Before incising the intestine, the author made an opening in the mesocolon The gastrocolic and gastro hepatic omentum were then ligated and clamps applied for removal of the stomach after the Hofmeister technique The anastomosis between the stomach and the jejunum is done with interrupted absorbable surgical sutures on the inside and interrupted nonabsorbable surgical sutures on the outside A very short loop of proximal jejunum is left, measuring not more than 2 in The author removes at least three fourths of the stomach Aseptic technique is carried out carefully The author states that whenever possible he prefers to remove the ulcer, but in 70 of 270 cases with duodenal ulcer he has left the ulcer in situ, performing an operation as illustrated He reports no leaks of the duodenal stump and no mortality in these 70 cases At the end of the operation the peritoneal cavity was irrigated with saline, a procedure that might be criticized by some surgeons as possibly spreading contaminated material The surgical technique demonstrated is good, and proper precautions are taken throughout the operation The photography is excellent This film is recommended for young surgeons, including residents

Regional Analgesia: 16 mm color sound showing time 34 minutes Prepared by Daniel C. Moore MD Seattle and John J Bonica MD Tacoma Wash Produced in 1952 by Rarig Productions Seattle. Procurable through representatives of Winthrop-Stearns Inc 1450 Broadway New York 18

This film demonstrates the authors' technique for regional anesthesia pertaining to blockade of the stellate ganglion, lumbar sympathetic chain, brachial plexus, and sciatic and femoral nerves, utilizing tetracaine (Pontocaine) hydrochloride solution Anatomic review of each block is well demonstrated by means of unusually clear drawings, animation discussion, and demonstration on the live subject Discussion includes indications, procedure, effects and extent of analgesia, and complications It is felt that aseptic preparation of the field should be stressed and demonstrated in its proper sequence At one point in the film, the gloved hand was seen to touch an obviously unprepared area and then to return to the operative field Listing of complications is an excellent teaching aspect of the film, but no visible evidence was presented during the procedures that equipment for treating such complications was actually ready and available The animation and captions are clear and complete, the narration is clear and concise, and the photography and drawings are excellent This film is recommended for surgeons, anesthesiologists, neurologists, and medical students

NEW FILM ADDED TO A M A MOTION PICTURE LIBRARY

Blood Streams in the Basilar Artery 16 mm color silent showing time 9 minutes Demonstrated by D A McDonald and J M Potter Department of Physiology St Bartholomew's Hospital Medical College London. Produced by the Wellcome Film Unit London in 1949 and sponsored by Burroughs Wellcome & Co (Wellcome Foundation) London Procurable on loan (service charge \$1 00) from Committee on Medical Motion Pictures American Medical Association 535 N Dearborn St. Chicago 10

This short, concise film shows in striking form the manner in which blood flows through the basilar artery of a rabbit, as revealed by the injection of a dye with and without experimental interruption of the flow The special situation treated

is that in which two arteries of equal size (right and left vertebral arteries) unite to form a single medium artery (the basilar) The anatomic situation is made clear by excellent diagrams in color, followed by brief sequences showing the dissection, cannulation and other preparations Because of the fortunate choice of experimental animal, the transparency of the artery permits one to see the rapid movement of the colored fluid, the separateness of streams from the right and left vertebral arteries, and the reversals of direction resulting from occlusion of one artery The dissection shown is too difficult as a routine procedure in most physiology courses In this film, it is so deftly done and so well shown that it affords students an opportunity to see things that they would probably never otherwise observe The color photography is excellent This and several other circumstances combine to give an appreciation of depth, which is helpful, and the film should be of considerable teaching value for medical classes in physiology

Sympathectomy for Ménière's Disease, Tinnitus, and Nerve Deafness.—According to Passe, neurovascular disturbances, the result of an underlying autonomic imbalance, could be the etiological factor in a large number of cases of Ménière's disease, tinnitus, and nerve deafness. It was this concept that prompted the author to use sympathectomy as an approach to the treatment of these conditions. Stellate ganglion block with 1% procaine hydrochloride without epinephrine was used as a diagnostic test in the selection of cases. Those patients who before stellate ganglion block showed a disproportionate loss of perception of speech intelligibility compared with the pure tone losses showed an equally disproportionate gain in speech discrimination compared with the pure tone audiometric gain after stellate ganglion block. This preoperative finding has extreme diagnostic and prognostic significance. Of 91 patients with Ménière's disease, 45 were treated by removal of the stellate ganglion using the standard anterior approach but also stripping the vertebral artery and 46 were subjected to upper dorsal sympathectomy according to Smithwick's technique, with the modification that only the second and third ganglia were decentral-

ized. In the group in which the stellate ganglion was resected, vertigo was completely relieved in 28 patients, improved in 16, and unchanged in 1, tinnitus was completely relieved in 11, reduced in 23, and unchanged in 11, hearing was improved in 32 with audiometric gains of 15 db or more in 16, while it was unchanged in 13. In the group undergoing upper dorsal sympathectomy, vertigo was completely relieved in 28 patients and improved in 16, and results were not known in 2. Tinnitus was completely relieved in 9, improved in 19 and unchanged in 16, hearing was improved in 38, with audiometric gains of 15 db and over in 10, while it was unchanged in 6 and results were not known in 2. In relieving the tinnitus and improving the hearing, stellectomy appears to give slightly better results. Patients with stellectomy have been observed for five years and those with upper dorsal sympathectomy for two years. Seventy patients with tinnitus that had no local organic cause were also studied by means of procaine hydrochloride block, 30 were subjected to removal of the stellate ganglion and 40 to upper dorsal sympathectomy. In the first group, tinnitus was completely relieved in 5 patients and reduced in 10, it returned to preoperative levels in 15. In the second group, tinnitus was completely relieved in 6 patients, reduced in 21, and returned to preoperative levels in 9. 4 patients were lost to observation. Thus the operation has been a complete success in 17%, worth while in 33%, and a failure in 50% of the stellectomies, but a complete success in 15%, worth while in 50%, and a failure in 35% of the upper dorsal sympathectomies. Of 60 patients with "idiopathic perceptive deafness" selected according to their response to procaine hydrochloride block, 19 were subjected to removal of the stellate ganglion and 41 to upper dorsal sympathectomy. In the first group hearing was improved in 16 patients, with a gain of 10 db or more in 13, and remained stationary in 3. In the second group hearing was improved in 32 patients, with a gain of 10 db or more in 24, and remained stationary in 5, results were not known in 4. As a result of his experience the author states that at the present time sympathectomy does seem to be the ideal treatment in a large group of cases of Ménière's disease. The few patients with nerve deafness who respond to procaine hydrochloride block should have the sympathectomy, for in those the results are gratifying and there is no other treatment for this whole group.

Cortisone and Corticotropin in Protracted Rheumatic Carditis.—Cortisone and corticotropin were given to 16 children between the ages of 7 and 16 years with acute protracted rheumatic carditis. All of these patients had moderate to pronounced structural damage of the heart and had had active rheumatic fever for four months to four years before the institution of hormone therapy. The duration of treatment varied from patient to patient, depending on the extent of improvement or the onset of untoward effects. Ten of the 16 patients were treated with cortisone during the first four weeks in

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individual subscribers, provided they reside in continental United States or Canada. Requests for periodicals should be addressed 'Library American Medical Association'. Periodical files cover only the last 11 years and no photoduplication services are available. No charge is made to members but the fee for other borrowers is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted.

doses of 200 to 300 mg daily for three days, 150 mg daily for the next three days, 100 mg daily for 15 days, 75 mg daily for two days, 50 mg daily for two days, 25 mg daily for two days, and 10 mg for one day. This was followed by a three week interval of supportive therapy only. This period was followed by a course of corticotropin (ACTH) therapy in doses of 30 mg twice daily for the first three days, 25 mg twice daily for the next three days, 20 mg twice daily for 15 days, 15 mg twice daily for two days, 10 mg twice daily for two days, 5 mg twice daily for two days, and 5 mg daily for one day. After an interval of three weeks, the regimen was repeated. Of the 16 patients, 7 showed mild improvement as manifested by an increase in appetite and a definite sense of well being, although some of the rheumatic symptoms remained unchanged, 6 patients showed moderate clinical improvement, with pronounced increase in appetite, gain in weight, lowering of the temperature, and disappearance of all symptoms. Three patients showed dramatic improvement within 48 hours after the beginning of therapy, there was disappearance of all rheumatic symptoms, drop in pulse rate and temperature, fall in erythrocyte sedimentation rate, and pronounced euphoria. Clinical improvement thus was obtained in all patients, and exudative phenomena were readily suppressed during hormone therapy. All 16 patients continued to show clinical and laboratory evidence of rheumatic carditis when therapy was discontinued. None of the authors' patients showed regression in clinical evidence of endocarditis or cardiac hypertrophy. Many of the patients showed some untoward effects. Ten patients showed one or several signs of Cushing's syndrome. Nine patients showed definite evidence of psychological effects, euphoria, or depression. In three patients pronounced syncope occurred following parenteral administration of cortisone acetate. Whether this form of treatment significantly affects the course of rheumatic disease in long standing cases remains to be proved. Further exploration in dosage schedule and method of administration may provide a more definite answer to this problem.

Corticotropin in Reiter's Syndrome—The occurrence of Reiter's syndrome, a self limited clinical triad composed of non-specific urethritis, purulent conjunctivitis, and acute arthritis in four men between the ages of 24 and 43 is reported. Although no definite cause has been established, the pleuro pneumonia-like organisms (L-organisms) that were cultivated from the urethra in one of the authors' four patients, as well as in many patients reported on by other workers, seem to bear a more than casual relationship to Reiter's syndrome. The classical triad was associated with weight loss and muscular atrophy in all four patients who were treated initially with bed rest, salicylates, and physiotherapy. The first patient received penicillin, streptomycin, aureomycin and antihistamines, and typhoid paratyphoid vaccine intravenously, the second penicillin, sulfadiazine, streptomycin, chloramphenicol (Chloromycetin) and oxytetracycline (Terramycin), the third oxytetracycline, and the fourth patient penicillin and streptomycin, which had no apparent effect on the course of the disease. All four demonstrated prompt and dramatic remissions during treatment with corticotropin (ACTH) in doses of 20 to 30 mg every six hours, which permitted ambulation and vigorous physical therapy. In addition, a sense of increased well-being, increased appetite, and associated weight gain were noted. All patients showed at least temporary relapses following therapy, and two required additional treatment with corticotropin. The authors believe that the use of corticotropin contributed greatly to the prevention of joint contractures in these patients and to their ultimate excellent outcome. As a result of their experience in these four patients and of observations collected from the literature, the authors state that the shortening of illness and the prevention of debility and joint contractures are the primary objectives of treatment of this self-limited syndrome and may be accomplished by the use of a nutritious diet, vitamin supplements, and a vigorous physical therapy regimen. Corticotropin, as an adjuvant, has a definite place in the over all management of Reiter's syndrome.

Deterioration in Dementia Paralytica—Comparative serologic and psychological investigations were made in 52 institutionalized patients with dementia paralytica, because it is generally accepted that the spinal fluid provides a reliable lead in assessing the effectiveness of the treatment. In general, it was found that the treated patients with negative spinal fluid reactions showed a more pronounced deficit both of intelligence and of personality resources than those cases still in an active phase. There was evidence, on the one hand, that part of the impairment to psychological functioning is reversible when the disease process is arrested early in the psychotic stage and, on the other hand, that some of the patients may continue to deteriorate even though treatment has rendered their spinal fluid negative. These results seem to indicate that two pathogenetic factors have to be considered one probably connected with the inflammatory component and responsible for the acute clinical picture and the pathological changes in the spinal fluid and relatively easily influenced by modern therapeutic methods, and another one, long acting, not easily or not at all influenced by therapy and responsible for the slowly progressing deterioration. There are reasons to believe that this second factor is a vascular one, as suggested by Merritt and co-workers.

Parathion Poisoning in Citrus Grove Operations—Between March 1 and Oct 31, 1951, 28 cases of supposed parathion poisoning in men employed in the spraying of citrus fruit were reported to the Florida Citrus Experiment Station. Of these 9 cases were confirmed as due to parathion poisoning by blood cholinesterase tests, 8 were probably due to parathion poisoning and 11 were definitely not parathion poisoning. All but one of the nine authenticated cases were exposed to parathion spray for more than 10 days. The histories of 13 patients are presented. Those of the nine authenticated cases of parathion poisoning emphasize the extreme importance of regular blood examinations during parathion exposure and the necessity for immediately removing a man from exposure if the red blood cell cholinesterase values drop below 70% of normal. One case suggests that in order for cholinesterase tests to be valid diagnostic aids, they must be made immediately after the patient becomes ill, as in some cases the cholinesterase levels return to normal quickly. The four other case histories suggest that the use of alcoholic beverages by those exposed to parathion may precipitate or aggravate symptoms of poisoning.

Treatment of Cervical Stump Carcinoma—Of 240 patients with carcinoma of the cervix treated by the author between 1933 and 1953, 26 (10.8%) were treated for carcinoma of the cervical stump. Most gynecologic surgeons consider two years as the dividing line in separating the "true stump cancer" cases from those in which the cancer was present but not recognized at the time of hysterectomy. Of the author's 26 cases, 13 occurred two years after supravaginal hysterectomy, which compares favorably with the figures given by others. The author as radiologist considers it of academic interest whether the case is a true stump cancer or a missed uterine-cervix cancer. Treatment is necessary in every case. In the present era of surgical use of antibiotics and blood banks, figures quoted by skilled surgeons indicate that mortality following complete hysterectomy is no greater than that seen with supracervical hysterectomy. Of the author's 26 patients 12 are living and 14 are dead. Of the 12 living patients, 7 have lived beyond the five-year period, constituting a 23% five year survival, which is slightly lower than the five year survival of 26.3% for all cancers of the cervix as reported by nine large clinics. Treatment consists of local irradiation of the cervix supplemented by external irradiation. In most cases in the past treatment has been with radium applied locally in the form of a contact capsule or interstitial needles. In the author's hands transvaginal irradiation has seemed safer and more efficient than locally applied radium. His present technique uses x rays with a half value layer of 1 to 15 mm of copper, depending on the bulk of the tumor to be treated. A dose of 500 r to 750 r is administered daily through the transvaginal port. On the same day x rays are administered through two external ports, crossfiring the pelvis. There may be as many as 20 separate applications. The one field treatment plan for transvaginal roentgen therapy is limited as to dosage by the reaction at the level of the external os. Up to now an air dose of 7,500 r to 10,000 r directed at the cervix through a single port has been used.

Treatment of Hyperthyroidism with Radioactive Iodine—From May 1950, to December, 1952, 111 patients with hyperthyroidism were treated with I^{131} at the University of Kansas Medical Center. Of these, 50 have been followed for at least six months since their last treatment. Remission of thyrotoxicosis occurred in 79 of the 111 patients. Results were unsatisfactory in 3, and were not evaluated in 29. Among the 50 patients who have been followed up for six months or more remission occurred in 48 (96%) and 2 were therapeutic failures. Total doses of I^{131} in this group ranged from 3 to 29 mc in patients with diffuse toxic goiters, with an average dose of 10.5 mc. The six patients with nodular toxic goiter required total doses of from 9 to 67 mc, the average being 29 mc. Clinical myxedema occurred in 7 (14%) of the 50 patients. The failure of treatment in two patients was attributed to previous administration of iodine-containing medications or diagnostic contrast mediums. Attempts at I^{131} therapy were ill advised in these patients. Radioactive iodine uptake rates below 20% at the two month follow up period predicted sustained remission of thyrotoxicosis in all but one patient. Exophthalmos was present in 29 of the 111 patients. Of the 29 patients 17 were followed at least six months, 7 showed marked improvement in the exophthalmos, slight improvement

occurred in 4, and no change was observed in 6. Retreatment was frequently necessary to bring about a sustained remission of hyperthyroidism and apparently did not increase the incidence of post-treatment myxedema.

Late Development of Laryngeal and Pharyngeal Carcinoma in Irradiated Areas—Holinger and Rabbett describe three patients with malignant lesions of the pharynx and larynx in whom the tumor developed in an area previously irradiated for a benign lesion. Two of these three patients were women. All three of the patients had been given roentgen irradiation for tuberculous infection of the cervical lymph nodes, 32, 30 and 27 years previously, respectively. The two women now have a squamous cell carcinoma and the man a fibrosarcoma in the direct line of the previously administered irradiation therapy. A review of the literature revealed the reports of 10 similar cases. The total series of 13 included 4 men and 9 women. The irradiation therapy had been given either for tuberculous cervical adenitis or for thyrotoxicosis from 20 to 32 years before the development of the neoplasm. The authors do not believe that the association of the irradiation and the development of the tumor is merely coincidental. Since irradiation therapy was commonly given for benign conditions of the neck several decades ago, more of these cases may be seen in the near future.

Cancer of Lung in Physicians—Letters and questionnaires were sent to the estates of physicians who had died of cancer of the lung, colon, stomach, kidney and bladder, leukemia, lymphoma and sarcoma. Death notices in THE JOURNAL provided information about the primary diagnosis. The years 1950 and 1951 and the first two months of 1952 were selected with regard to cancer of the lung, death notices of 1949 were included in this investigation. Of the 118 questionnaires mailed to the relatives of physicians who had died of pulmonary cancer, 63 were completed, and of the 214 questionnaires sent to the relatives of physicians who had died of other forms of cancer, 133 were completed. Exposures to possible respiratory irritants were studied in 63 physicians with cancer of the lung and 133 physicians with cancer outside the respiratory tract. A highly significant association between the use of tobacco and the development of pulmonary cancer was found among physicians. The estimated mortality from cancer of the lung rose from 10 per 100,000 among nonsmoking physicians to 133 per 100,000 among physicians smoking 35 or more cigarettes a day. There were no significant differences in exposure to respiratory irritants other than tobacco among the two groups. These results agree with those of previous studies. The mortality rate was greatest among cigarette smokers, but even among cigar and pipe smokers it was greater than that among nonsmokers, indicating an association of cancer to all three forms of smoking, even though this relation appears greatest with cigarette smoking.

Acute Postoperative Pancreatitis—Dunphy and co-workers describe eight cases of acute postoperative pancreatitis, which they observed over a period of two years, and they also cite studies carried out by others. They feel that acute postoperative pancreatitis is a tragic and somewhat inexplicable accompaniment of surgical operations. It occurs more frequently than has been supposed, and may follow operations in which trauma to the pancreas, reflux of bile into the pancreatic ducts, or obstruction of the main pancreatic ducts can be excluded. Usually, however, it follows operations on the biliary tract and stomach, which involve mobilization and manipulation of the pancreas. Minor interference with the blood supply to the pancreas may be an important factor, if combined with trauma to the gland or partial obstruction to the pancreatic ducts. The posterior pancreaticoduodenal artery and the duct of Santorini are particularly vulnerable to injury when the duodenum is mobilized during gastrectomy. In cases in which major obstruction or injury to the ducts can be excluded, sludging of the pancreatic secretions incidental to medication, dehydration, or other factors associated with surgical operations may be a contributing factor that merits further investigation.

Plastic Surgery in Treatment of Hemangioma—Arterial hemangioma may occur anywhere on the body as a bright red area usually raised from the surface, and may be multiple. This red area may be only part of the tumor, as it may extend out beneath the skin around the more noticeable red portion. The tumor may also occur in a spotty arrangement, sometimes with the deeper elements connecting the more superficial red areas. The arterial hemangioma is locally destructive. When it is called a "birthmark" or "strawberry mark," the "friendly" terms, themselves, may lend false security in what has been observed to be a potentially dangerous lesion although some

arterial hemangiomas may regress spontaneously. Small raised or flat tumors located where the resulting scar is of no practical importance can most easily be completely destroyed with a fine cautery. If all arterial hemangiomas could be seen at this stage of development, there would be no need for further discussion of treatment. Some of these lesions can be surgically excised and the wound closed if the location permits. Most of the ones observed by the authors occurred about the face where excision and closure would require removal or distortion of a feature. Extensive resurfacing with a graft on the face is seldom the immediate treatment, and flap coverage may be even less desirable. Primary surgical resection of large growths might be dangerous to life. Minimal interstitial irradiation with gold radon seeds has been found satisfactory in many instances. External irradiation by radium or x rays may be used, but may be impractical because of the difficulty of holding the radium in place on a small infant, or because it may be almost impossible to hold the infant still for a calculated dose of x-rays. Interstitial irradiation also is of advantage in the treatment of the more solid endothelioma beneath the skin. With the aid of photographs and legends, the authors present additional observations on the use of the multiple suture control of large vessel angiomas along with details of minimal interstitial radiation treatment of bright red or arterial hemangiomas. They also refer to their earlier reports on this form of treatment, and they cite the opinions of other observers.

Erythromycin to Counteract Enteritis Resulting from Antibiotic Therapy—In this paper Dearing and Heilman present additional evidence that resistant strains of *Micrococcus pyogenes* (staphylococci) may develop in patients as a result of administration of antibiotic agents. These resistant strains of micrococci (staphylococci), when present in the intestinal tract in large numbers, may produce varying degrees of gastro intestinal and systemic reactions. The 44 patients reviewed here had been hospitalized for some illness or surgical procedure. Cultures were made from the intestinal lumen at the time of operation on the intestinal tract in some of these patients who had received oxytetracycline (Terramycin) prior to such operations. If micrococci were found, one of two procedures could be used. 1 The patient received erythromycin prophylactically the day after operation, 2 The patient was observed to ascertain whether symptoms would develop if no erythromycin was administered. Oral administration of erythromycin was then begun if symptoms did occur. Erythromycin was given orally in doses of either 300 or 400 mg four times daily until the untoward symptoms subsided and the micrococci disappeared from the stool. Many of the patients who experienced diarrhea after antibiotic therapy had cultures of the stool made to determine whether *Micrococcus pyogenes* was present. The data on these 44 patients are summarized. There was suggestive but not conclusive evidence that this micrococcal enterotoxin reaction is not necessarily related to pseudo membranous enterocolitis.

Subacute Infectious Endocarditis Treated by Antibiotics—Results of antibiotic treatment of 202 patients with subacute infectious endocarditis, some with a follow up of seven years, were studied in relation to prognosis. There were 49 deaths during treatment or within three months afterward caused by persistence of the infection, often with cardiac and renal complications, or by the development or exacerbation of cardiac or renal insufficiency in spite of regression of the "infectious syndrome." Results among the survivors were considered good when the patient's condition was excellent or permitted almost normal activity and poor when symptoms indicated exacerbation of the cardiac condition or renal or neurological sequelae. Follow up of from 1 to 7 years showed 21 late deaths and 132 survivors, of whom 120 had good results, 4 had poor results, and 8 failed to reply to letters in 1952. Heart failure was the principal cause of the late deaths. The immediate death rate is highest in the primary forms of subacute infectious endocarditis, with the abacterial forms and those occurring in patients with aortic affections next in order. Subacute infectious endocarditis rarely occurs in patients in heart failure, but when it does it is fatal. Factors affecting the prognosis unfavorably are prolonged febrile episodes, cardiac complications, such as angina, acute cor pulmonale, bundle-branch block, and especially heart failure, and renal insufficiency. Persons who have apparently recovered from subacute infectious endocarditis still have heart disease, and, even though their condition seems satisfactory, they may sooner or later have recurrences caused by a fresh infection or show signs of cardiac deterioration or renal insufficiency. Recurrences and renal insufficiency are rare, but heart failure appears in 10% of the survivors within from 3 to 60 months. The late results in this series show that a stable cure was obtained in 65% of the severe cases and that the classic form of subacute infectious endocarditis in a patient of middle age, with a history of rheumatic fever, with no previous heart failure, and with positive blood cultures was cured in 83% of the patients, more than 70% remaining alive and well from four to seven years after the end of treatment.

Fate of Intravenously Injected Iron—The fate of intravenously administered iron was investigated in young cats with iron deficiency. Examination of the organs of these animals from two to three days after the last injection of iron revealed that most of the iron was deposited in the liver. After injection of very large amounts that greatly exceeded the therapeutic doses, some iron deposits were found in the lungs and occasionally in the spleen. The kidneys always remained free of iron. Since passage through the liver is the best for therapeutic utilization, intravenous administration of iron seems to provide an efficient and rapid method to compensate for an existing iron deficiency.

Survey of 647 Cases of Leukemia—Two separate surveys were carried out in Scotland of 647 patients with leukemia, 440 of whom were admitted to hospitals in Edinburgh and 207 in Aberdeen between 1938 and 1951. Contrary to previous reports, the commonest type was chronic lymphatic leukemia, followed by the chronic myeloid, acute lymphatic, acute myeloid, and monocytic types, in that order. In about one fifth (140) of the total number of cases the blood contained no leukocytes. This phenomenon occurred most frequently in the acute forms of the disease and was least common in chronic myeloid leukemia. The age incidence of the chronic lymphatic (average age 61.5 years), of chronic myeloid (average age 49.8 years), and of acute lymphatic types (average age of 20.4 years) conformed to the previously reported figures, but acute myeloid and monocytic leukemia with age ranges of from 14 months to 80 years, and from 9 months to 86 years, respectively, showed a much wider range of incidence than is generally reported. Males were affected oftener than females, in the ratio of 7 to 6. The male predominance was most pronounced in chronic lymphatic leukemia, and was less obvious or not evident in the other types. Evidence is presented that suggests that there has been a two-fold increase in the over-all incidence of leukemia in Scotland over the period of this survey. There seems to have been a particular increase in the lymphatic type of the disease, but the incidence of all forms is increasing.

Q Fever in Great Britain—Explosive outbreaks represent only one aspect of Q fever in Britain. Because the final diagnosis of Q fever depends on a retrospective laboratory test, the cases identified probably represent but a small proportion of the total number that actually occur. Judging by specimens received at the Virus Reference Laboratory, Colindale, Q fever accounts for 9% of cases of atypical pneumonia (com-

pared with 8% due to influenza and 1% due to psittacosis) and for 5% of pyrexias of unknown origin. The principal sources of human infection are now known to be cattle, sheep, and goats, animals that may appear to be healthy but excrete the Q fever organism in the feces, urine, milk, placenta, and fetal membranes. Man is probably infected either by inhaling dust contaminated with these excreta or by drinking infected milk. The organism is remarkably hardy, and the pasteurization methods provide only marginal safety. It also resists many disinfectants and can persist in dust for long periods in normal ranges of temperature and humidity. This may explain why Q fever is not limited to those whose residence, occupation, or habits bring them into direct contact with cattle, sheep, or goats, or their products. Excluding outbreaks, 69 sporadic cases of Q fever have been identified in Britain since the disease was first discovered there in 1948, 58 of these had typical clinical attacks, usually resembling atypical pneumonia. Four patients died during the infection, 2 with pulmonary infarction, and one of these may have had chronic Q fever. Two thirds of the patients gave a history of exposure to known sources of Q fever. Of 4,407 normal blood donors in England and Wales, 91 (2.13%) showed serological evidence of previous infection with Q fever. Examination of the milk from 1,031 herds of cattle showed that 8.2% of the herds in Kent were excreting *Rickettsia burnetii* in the milk, compared with 2.7% in Devon and 0.85% in East Anglia.

Late Complementary Adrenalectomy in Thromboangitis After Sympathectomy.—Patients with thromboangitis may have persistent edema of the foot with ulceration and pain in the toes after lumbar sympathectomy. Amputation in such cases is not inevitable. Complete regression of symptoms can often be secured by a complementary perifemoral sympathectomy if the artery is permeable for an average of from 8 to 12 cm or by an arterectomy if it is obliterated. A low sympathectomy can also be supplemented by a high one, and vice versa. The vasodilatation following these procedures corrects the residual ischemia. Similar benefits may be derived from adrenalectomy even after a lapse of years. Leriche reports cases in which the disease was arrested and amputation was avoided by adrenalectomy performed some years after the first appearance of symptoms, even after one limb had already been sacrificed. Microscopic adrenal adenomas are often seen in patients with thromboangitis, and on one occasion adrenalectomy resulted in the removal of a tumor the size of a walnut. Leriche's 33 years of experience and the records of more than 150 adrenalectomies lead him to consider it the best possible operation for patients with thromboangitis.

Nonsurgical Treatment of Urogenital Tuberculosis.—The value of antibiotics in the treatment of tuberculous genital lesions in men is limited and their use should be restricted to the severe forms of the disease that often appear later. The possible coexistence of an undetectable, medically curable renal lesion provides the only exception to this rule. Administration of *p*-aminosalicylic acid alone, reserving streptomycin for use in subsequent emergencies, might prove effective in such cases and would eliminate the dangers resulting from drug resistance. Established renal lesions cannot, as a rule, be cured by antibiotic therapy, but when the lesion is slight and renal function is normal or nearly so, nephrectomy can safely be postponed in the hope that the disease may be arrested and rendered quiescent. Some patients will be able to resume an active life with little or no discomfort after a rest period; others may require nephrectomy later if antibiotic treatment proves ineffective or a relapse occurs. Progressive renal destruction

however, may make postponement dangerous in patients who will not accept continued urological observation. Cystitis is a strong indication for surgical intervention. Nephrectomy should not be delayed when the renal lesions are severe or even moderate, because such lesions cannot be cured by medical means and to postpone the operation is to risk a poor result. Antibiotic treatment of bilateral tuberculosis, though merely palliative, has a marked effect on the general condition, results in the disappearance of certain forms of hematuria, clears the urine, and provides at least temporary relief from cystitis of recent origin. The chief value of the antibiotics in urogenital tuberculosis lies in the fact that they have extended the scope of surgical treatment and made it safer and more effective.

Electrocardiographic Changes During Angiocardiography.—The authors studied the changes occurring in electrocardiograms taken during angiocardiography in 28 patients with acquired heart disease, 47 with congenital heart disease (31 of these with cyanosis), and 5 with pulmonary neoplasms. Angiocardiography with the injection of 1.2 to 1.5 cc. of contrast medium (a fluid containing 70% iodine) per kilogram of body weight was almost always performed with the patient under local anesthesia. In only nine children was general anesthesia necessary. Transitory bradycardia was seen in patients with acquired and congenital heart disease, but it lasted longer in those with congenital heart disease in whom cyanosis was also present. In patients with acquired lesions of the mitral valve, it was followed by normalization of the heart rhythm and then often transitory tachycardia. Tachycardia followed the injection of the contrast medium in patients with sinus rhythm and total arrhythmia and lasted as long as 5 to 10 minutes. Transitory extrasystoles appeared 10 to 20 seconds after the injection in four patients with mitral stenosis and sinus rhythm. There were never changes in the QT interval and the electric atrioventricular conduction. In one third of the patients with congenital heart disease and one-half of those with acquired heart disease there was a reduction in the voltage of the QRS complex in the three leads, but this also disappeared in a few minutes. The T wave showed reduction of voltage, leveling, and inversion in patients with acquired heart disease and especially in those with mitral stenosis. These changes were less evident in patients with congenital heart disease, and the authors attribute them to the anoxia produced in the myocardium immediately after the injection of the contrast medium. Clinical observations of the patients during this phase of coronary insufficiency as indicated by the electrocardiogram revealed precordial distress and difficult breathing. To avoid these phenomena, oxygen was given to some patients before, during, and after angiocardiography was performed. To other patients morphine, atropine, and sparteine were given before hand, but these drugs did not influence the electrocardiographic tracings. In the children who were under general anesthesia the T wave tracings did not change significantly, perhaps because of the reflex nature of these phenomena. Also the tracings did not vary greatly in six cases in which a second angiocardiogram was made several days later by

catheterization of the heart with smaller doses of contrast medium injected at a much lower speed. Thus these changes seem to be correlated with the size of the dose of opaque medium, the speed with which it is injected, and its high concentration. The principal factor, according to the authors, is the myocardial ischemia that occurs immediately after the injection and is caused by chemical action of the fluid on the endocardium and the coronary vessels, a reflex coronary spasm, and the arrested flow of blood through the myocardium. Special caution is suggested when angiocardiology is done in patients in whom previous electrocardiograms reveal coronary insufficiency.

Prophylaxis of Intestinal Adhesions with Streptokinase, Streptodornase, and Pancreatic Enzymes—Experiments were made in 30 guinea pigs to study the action of streptokinase, streptodornase, and two pancreatic enzymes (one with fibrinolytic action and the other with lytic action on desoxyribonucleic acid) on postoperative intestinal adhesions. Adhesions were produced in 15 guinea pigs by removing sections of the serous membrane from intestinal loops. Then 20,000 IU of streptokinase and 5,000 IU of streptodornase were injected in five animals and 40 mg of the fibrinolytic enzyme and 10 mg of the lytic enzyme extracted from bovine pancreas in five, five served as controls. Laparotomy performed 20 days later showed that the enzymes had not only failed to prevent the formation of adhesions between the intestine and the parietal peritoneum but had in fact caused the production of more extensive and firmer adhesions than those in the control animals. In addition, the general condition of the treated animals was worse than that of the controls, in which removal of the adhesions was much easier. After the adhesions were removed, the controls were given 5 cc of isotonic sodium chloride solution, whereas the pancreatic enzymes were injected again in five of the others. Three of these died of peritonitis. After 20 days the adhesions were definitely less extensive, less numerous, and less firm in the controls. In a second series of experiments peritonitis was provoked in 15 guinea pigs by repeated perforation of the large intestine with a needle. After three days a dose of streptokinase and streptodornase was injected in five of them, pancreatic ferments in five, and isotonic sodium chloride solution in four that were to serve as controls (one of them had died of peritonitis). Laparotomy 20 days later revealed in this group also larger and firmer adhesions in the animals treated with the enzymes. The study was continued following the procedure used for the animals of the first group, and the same results were obtained. Not only had the enzymes not prevented the onset of adhesions but, according to the authors, they had enhanced the process of their formation.

Procaine Hydrochloride Esterase Test in Hepatic Disorders

—In a previous paper one of the authors demonstrated that human serum contains an esterase of hepatic origin that is capable of hydrolyzing procaine hydrochloride into *p*-amino benzoic acid and diethylamino ethanol. The rate and extent of this hydrolysis can be measured by determining colorimetrically, at intervals, the amount of free *p*-aminobenzoic acid in the serum. In normal persons hydrolysis proceeds rapidly, while in patients with liver insufficiency it takes place more slowly. The rate of hydrolysis can, therefore, be used as a test of liver function. To provide a basis for the detection of slight variations in the rate of hydrolysis, the authors established a normal procaine hydrolysis curve by determining the percentage of procaine hydrolyzed at five minute intervals

and plotting these values on a graph. They found that in normal subjects 45% of the procaine is hydrolyzed in 5 minutes, 70% in 10 minutes, 85% in 15 minutes, 95% in 20 minutes, and 100% in 30 minutes. In patients with slight liver insufficiency the rate of hydrolysis was slightly subnormal throughout the test, or was subnormal only during the first 15 or 20 minutes and then became normal. In patients with moderate liver insufficiency, there was 80% or less hydrolysis after 30 minutes (moderately subnormal curve), and in patients with severe insufficiency the curve tended to flatten out at levels as low as 10 or 20%. Repeated tests during the course of liver disease reflected the severity of the liver damage and seemed to have prognostic value. Of 34 patients with progressive alcoholic cirrhosis, 28 had markedly subnormal procaine hydrolysis curves, and the remaining 6 had moderately subnormal curves. Of seven patients with cancer of the liver, three had considerably subnormal curves, two had moderately or slightly subnormal curves, and two had normal curves. Six of seven patients with severe virus hepatitis had markedly subnormal curves. The curves of seven patients with severe jaundice were markedly subnormal in three cases, moderately subnormal in two, slightly subnormal in one, and normal in one. Of eight patients with stones in the common bile duct, four showed normal curves, three slightly subnormal curves, and one a markedly subnormal curve. In certain patients this test for procaine hydrochloride esterase gave subnormal results when other liver function tests, including galactose tolerance, thymol turbidity, cephalin-cholesterol flocculation, cadmium, and prothrombin tests still showed no evidence of liver damage. As a result of these studies the authors consider the procaine hydrochloride esterase test as a reliable measure of the enzymatic function of the liver.

- *Buffering of Gastric Juice in Study for Mycobacterium Tuberculosis. W. Roth and H. Birkhäuser—p 240

Lymphocytic Encephalomeningitis—The epidemic occurrence in 1950 of benign lymphocytic encephalomeningitis in 10 patients between the ages of 10 and 55 is reported. The disease had a biphasic course in 8 of the 10 patients, including some with the acute type as well as those with the protracted type. The interval between the two phases varied from one week to eight weeks. In the remaining two patients with the acute type of the disease, its course was monophasic. In two patients the disease started with stomatitis. One patient had three bouts of fever, the last being associated with a rash. All patients complained of some form of headache. Examination of the cerebrospinal fluid revealed a pronounced lymphocytic reaction, with 38 to 2,632 cells per cubic millimeter in seven patients. In one patient there were 248 polymorphonuclear cells in a total of 336 cells per cubic millimeter, and in another patient there were 8 polymorphonuclear cells in a total of 12 cells per cubic millimeter. The cerebrospinal fluid was normal in one patient. The protein content varied, and its maximum value was 63.8 mg per 100 cc. Involvement of the liver, sometimes pronounced and sometimes mild, was demonstrated by the galactose tolerance test. The liver was tender on palpation in two patients. Icterus was absent in all patients. Reactions to the Takata test were negative. A rubella-like rash, always occurring in the second phase of the disease, was observed in five patients. Nephritic urine findings occurred in one patient. This was regarded as a generalized virus infection, with primary involvement of the meninges and the nervous system and less pronounced involvement of the liver, skin, and kidneys. Brucellosis, leptospirosis, Q fever and syphilis could be excluded by serologic examinations. Differential diagnosis from poliomyelitis proved to be difficult. The similarity of the condition in the authors' patients to that in patients with epidemic lymphocytic encephalomeningitis reported on in the literature is emphasized.

Buffering of Gastric Juice for Detection of Tubercle Bacilli.—Kabler and Lundholm's technique of buffering specimens of gastric juices with crystalline disodium phosphate before examining them for tubercle bacilli was tested by the authors in experiments on guinea pigs. Only 110 of 395 specimens examined showed tubercle bacilli. Of these 110 specimens, 55 showed bacilli whether the buffer was added or not, 44 showed bacilli only when the buffer was added, and 11 showed bacilli only when the buffer was not added. Of 78 specimens examined on the same day on which they were collected, 24 (30.8%) showed bacilli when buffered and 24 (30.8%) showed bacilli when not buffered. Of 237 specimens examined one to two days after their collection, 58 (24.5%) showed bacilli with the buffer while only 34 (14.3%) did so without the buffer. Of 80 specimens examined more than two days after their collection, 17 (21.2%) gave positive results with the buffer, while only 8 (10%) did so without it. Significantly more positive results thus were obtained from specimens of gastric juice to which the phosphate buffer had been added, provided that the examination of the specimens was delayed for at least one day. Such a delay can hardly be avoided for technical reasons, and consequently buffering is indicated in all cases. The fact that bacilli were found only without the addition of the buffer in 11 specimens may have been due to unequal distribution of small numbers of bacilli in the gastric specimens.

Effect of Isoniazid on Pulmonary Tuberculosis.—Isoniazid alone was given to 100 patients with pulmonary tuberculosis, more than half of whom had previously received substantial doses of streptomycin. Collapse therapy was used in connection with isoniazid in 12% of the cases. Treatment lasted for from 10 to 12 weeks in most cases, but in 20% it was continued for from 4 to 5 months. The dose which consisted of 5 mg per kilogram of body weight, given in three divided doses daily, increased as the patient gained weight. The drug had a pronounced effect on functional and general symptoms regardless of the age or sex of the patient. Cough was benefited in 67% of the patients, being suppressed in 17%, decreased rapidly in 27%, and decreased slowly in 20%. Expectoration was quantitatively reduced in 60% (suppressed in 18%). Appetite increased rapidly even in patients with long-standing anorexia. In 55% the appetite remained improved after discontinuance of the drug. Gains in weight of from 1 to 6 kg were observed within a month in 66% of the patients. This increase in weight continued for two months in 52% and to a lesser degree after cessation of treatment in 44%. Improvement in the general condition, with euphoria and disappearance of the depression characteristic of tuberculous patients, was rapid, occurring in two-thirds of those who were gravely ill, but was permanent in fewer than half. Fever was relieved in certain patients who had had elevated temperatures for several months, return of the temperature to normal levels was secured after one month in 86% and after two months in 92%. The effect of isoniazid on the radiological signs was much less marked. Recent lesions in all forms of tuberculosis showing the greatest improvement. Cavities were rarely healed, although some were reduced in size. The improvement produced by isoniazid made some patients eligible for collapse therapy, while in others it was possible to defer such treatment advantageously. Tolerance for the drug was generally good. Cochlear and vestibular functions did not seem to be impaired and there were no significant hepatic or renal disturbances. The blood formula, however, should be watched, and constant neurological surveillance must be maintained, because epileptic seizures may occasionally be provoked. Isoniazid should not be given to patients with epilepsy.

 *Hashimoto's Struma with Report of Two Cases V Olesen—p 241
 Convulsions During General Anesthesia S Jørgensen O Secher and E W Andersen—p 245

Hashimoto's Struma.—Hashimoto's struma is an uncommon disease that affects women in middle life predominantly. It may be seen in all age groups, though seldom in patients under 30. It does not occur particularly in goiter areas. The cause is unknown. The subjective symptoms are few and vague and the goiter has usually been present for from months to years before medical advice is sought. Differential diagnosis with regard to cancer is important. Struma lymphomatosa is characterized by its cartilaginous consistency and the fact that it embraces isthmus and both lobes and is well defined and freely mobile, there are no signs of involvement of blood vessels or nerves or of regional glandular inflammation or metastases. A tendency to myxedema is present, and the sedimentation rate is generally slightly increased. Some persons with mild forms are believed to recover spontaneously. Olesen says that many patients do not require treatment but they should be closely observed for malignancy or symptoms of compression. Operative treatment, when diagnosis is certain, consists of subtotal thyroidectomy. The prognosis is good. Postoperative complications are infrequent. Tendency to recurrence after operation is slight. Recurrences that have been reported are due to the removal of only one lobe. Recovery after roentgen or radium treatment has been reported, but the increased fibrosis that follows may perhaps increase the danger of compression of the trachea. In the two cases described the diagnosis was based on histological findings after thyroidectomy because of suspected malignancy. Postoperative myxedema was controlled by medical treatment.

 *Further Observations on Isoimmunization During Pregnancy H J Pettenkofer and M Petry—p 12
 Placental Hormones in the Chicken Feeding Test E Haupt—p 21

Isoimmunization During Pregnancy.—Between January, 1951, and May, 1952, blood specimens from 1,763 unselected pregnant women and 3,423 puerperal women were examined at the serological department of the Robert Koch Institute. Forty-three or 2.44% of the pregnant women and 110 or 3.21% of the puerperal women were found to have antibodies to the less common blood group factors. The slightly smaller incidence of such antibodies in the pregnant women is ascribed to the fact that the serum of many of the pregnant women was examined during the early months of pregnancy, when antibodies had not as yet developed. Signs of hemolytic disease of the newborn (erythroblastosis) were observed in 29 of the infants of the 3,423 pregnant women (0.85%). Five of the 29 infants were stillborn. These 5 and 2 other infants showed the signs of hydrops fetalis, 17 had icterus gravis neonatorum and 9 had anemia neonatorum. A table listing the specificity of the antibodies found in the 153 (43 pregnant and 110 puerperal) women shows that the Le^a antibody was the most frequent, but none of the women with this antibody had babies with erythroblastosis fetalis. Twenty-two cases of erythroblastosis developed following immunization with the D factor, 4 cases following immunization against the A factor and one case each following immunization to the C and E factors. Five of the 29 mothers with erythroblastotic infants were Rh positive. It was found that in mothers with the blood group O, isoimmunization during pregnancy is rare, but mothers with the blood group A have a tendency to form antibodies against the erythrocytes of their infants. In 483 unselected cases of birth of healthy infants there were 62.16% multiparas among the Rh-compatible mother-child combinations, whereas in the group of Rh negative mothers with Rh positive children, only 41.67% were multiparas. This difference of 20.49% is statistically significant. Measures that should be taken in case of isoimmunization during pregnancy are discussed.

BOOK REVIEWS

Fundamentals of Clinical Orthopedics. By Peter A. Casagrande M.D. Attending Orthopedist at Chronic Disease Research Institute of University of Buffalo, Buffalo, New York and Harold M. Frost, Jr. M.D. Forewords by Joseph S. Barr M.D. and Frank N. Potts M.D. Special contributors Dr. Bert P. Austin et al. Additional contributors: Mr. Eric Balke et al. Cloth \$18.50 Pp 582 with 390 illustrations Grune & Stratton Inc. 381 Fourth Ave. New York 16 1953

This is a well written and well illustrated text on clinical orthopedics. The divisions permit easy reading, and grouping of the subjects has been extremely well done. Practically no orthopedic problem has been omitted. The manner of presentation is logical in that the clinical aspects of the various orthopedic disabilities are discussed in regard to etiology, physiology, and anatomy. Clinical description is excellent. Treatment has been deliberately minimized, all of the various treatments for the many conditions would have required an other volume. The drawings explaining the mechanism of pulls in fractures, while not extremely new, give a very clear-cut and easily understood description of muscle pull. A notable feature is elimination, as far as possible, of proper names of diseases, signs, and operations. Rather than the proper name, adequate anatomic or physiological terms have been used, and this is of greater value than a group of proper names to memorize. The book is so detailed that it is beyond the use of the medical student, except as a very excellent reference book. For an orthopedic resident, however, it should be very valuable. It would also be a definite contribution to every orthopedic library. The only unfavorable feature is the large size of the book. The printing is excellent, and the size of type makes reading easy. The authors should be complimented for their extensive work in condensing so much material into one volume.

John Abernethy: A Biography. By John L. Thornton, A.L.A. Librarian St. Bartholomew's Hospital Medical College, West Smithfield, London E.C.1. Cloth 25/- Pp 184 with 14 illustrations. Distributed by Simpkin Marshall Ltd. London 1953

The principal sources of information on John Abernethy are found in the "Memoirs of John Abernethy" by George Macilwain, one of his pupils. Although the book is factually accurate, it is somewhat one-sided in the interpretation of the illusive character of Abernethy, probably because the author had not achieved any degree of intimacy with his teacher or his family. The present biography is based on a thorough study of all available material and sheds new light on the controversial personality of Abernethy, as well as on his contemporaries and their relationships with one another.

Abernethy was born in 1764 and lived during the reigns of Charles III and Charles IV. The period was one of intense activity in science and medicine, and young Abernethy took advantage of the facilities offered by the most prominent teachers in London. They were MacLaurin, Sir William Blizard at the London Hospital, Percival Pott at St. Bartholomew's Hospital, Sir Charles Blizard, and the great John Hunter. Abernethy was probably most influenced by Hunter, so that in his own activities he followed his master's philosophical theories. Abernethy was first to ligate the external iliac artery for aneurysm. He also ligated the common carotid for hemorrhage, and improved treatment of lumbar abscesses by incision. He believed that local diseases are either of constitutional origin or are due to digestive disturbances. Abernethy was the founder of the school of British surgery based on physiology rather than anatomy, and is considered the first great English surgeon of the last century to treat his patients by expectant means rather than by operation.

As to the eccentricities and rudeness of Abernethy in his relations to his patients, the opinion of the Duke of Sussex, quoted by the author, probably best describes it: "Mr

Abernethy was one of those pupils of John Hunter who appears the most completely to have caught the bold and philosophical spirit of his great master. He was the author of various works and memoirs upon physiological and anatomical or surgical subjects. As a lecturer, he was not less distinguished than as an author. He enjoyed more than an ordinary share of public favor in the practice of his profession, and, though not a little remarkable for the eccentricities of his manner and an affected roughness in his intercourse with his ordinary patients, he was generally kind and courteous in those cases which required the full exercise of his skill and knowledge, and also liberal in the extreme when the infliction of poverty was superadded to those of disease."

The biography should be of interest to physicians not only because of the contributions of Abernethy but also because of the intimate knowledge that has enabled the author to sketch a number of personalities associated with St. Bartholomew's Hospital and with English surgery of the period.

Collegiate Education for Nursing. By Margaret Bridgman. Cloth. \$2.50 Pp 205. Russell Sage Foundation, 505 Park Ave. New York 22 1953

This book is important to all physicians, nurses, and hospital administrators who are concerned about the future education of nurses. The book outlines in brief the situation in nursing service available today. It shows that there are actually more graduate nurses currently working than at any previous time. At the same time it points out the weaknesses in the present system for education of nurses and recommends that experimentation and research in nursing education be developed on the collegiate level. The book is really a plea for a change in the outmoded and stereotyped teaching methods of the past. The author states that this book "is offered as a basis of discussion in the hope that, with other current studies by many groups and individuals who are working on the problem, it may help to clarify issues and bring about a consensus on principles leading to satisfactory long range plans for action."

Hormonal and Neurogenic Cardiovascular Disorders: Endocrine and Neuro-Endocrine Factors in Pathogenesis and Treatment. By Wilhelm Raab M.D. F.A.C.P., F.A.C.C. Professor of Experimental Medicine, University of Vermont, Burlington. Cloth. \$15 Pp 722 with 88 illustrations. Williams & Wilkins Company, Mount Royal and Guilford Aves. Baltimore 2 1953

The author's basic thesis stresses the importance, in the production of cardiovascular disease, of the release of the catecholamines, epinephrine, and arterenol into the myocardium and the vascular musculature of the body. He presents many cogent arguments in support of this thesis and attempts, more or less successfully, to show that the actions of such amines on cardiac and vascular tissue are capable of inducing both the functional and structural alterations seen clinically.

On page 525, the author says, "Some time honored but out-dated mechanistic views which interpret cardiovascular functional and structural changes solely in terms of coronary flow and of hemodynamic factors are no longer tenable. They must be revised in the light of present-day knowledge of ubiquitous neuroendocrine and endocrine biochemical influences upon cardiovascular tissue metabolism and of their interplay. Teleological auxiliary hypotheses are becoming increasingly superfluous and should be discarded." He points out that much progress has been made recently in the treatment of hypertension, angina pectoris, and congestive heart failure by such measures as surgical sympathectomy, antiadrenergic medication, and radiotherapy, along with thyroid inactivation, restriction of dietary sodium, and adrenalectomy. Finally, he expresses the thought that even greater progress in therapy may be expected with the greater understanding of the fundamentally biochemical nature of the common cardiovascular disorders. He suggests that the use of the so-called sympatholytic drugs appears ideal as a nonsurgical method of symp

thetic inactivation and feels that dihydroergotamine is safe for clinical use and apparently has normalized both the clinical status and the electrocardiogram in patients with angina pectoris X ray inhibition of adrenal function for the treatment of angina pectoris yielded improvement in 76% of 200 patients, 31% of whom were almost entirely relieved of their symptoms for an average of three and one half years

The student of cardiovascular disorders, both clinical and experimental, should spend much time studying Raab's postulates The volume is well organized, with many cross references in the text as well as an unusually large list of other references The physical make up of the volume is excellent It is well bound, and the type is clear and easily read This book can be recommended without reservation

Der Intermediäre Stoffwechsel. Von Dr. Dr. Konrad Lang o.ö. Professor der physiologischen Chemie Direktor des physiolog.-chem. Instituts der Universität Mainz. Lehrbuch der Physiologie in zusammenhängenden Einzeldarstellungen. Unter Mitarbeit einer Reihe von Fachmännern. Herausgegeben von Wilhelm Trendelenburg und Erich Schütz. Cloth 39 60 marks. Pp 423 with 29 illustrations Springer Verlag Reichpietschauer 20 Berlin W 35 (West Berlin) Neuenheimer Landstrasse 24 Heidelberg Göttingen 1952.

In the preface, Dr. Lang claims that this is the only recent monograph in German on intermediary metabolism In consideration of this fact, he treats both biochemical and physiological aspects of the intermediary metabolism of higher animals, is particularly careful with his nomenclature and style, includes quantitative data where possible, covers the literature with unusual thoroughness, and includes extensive indexes This treatment will allow the work to be used both as a textbook and as a reference work The 20 pages of literature citations will appeal to English-speaking biochemists and physiologists since several recent monographs in English are listed Dr. Lang states that his references are complete through June 1, 1952 American and British publications are cited as often as continental works Wherever possible the older literature is disposed of by citation of reviews, so that the reader interested in pursuing a point will be able to find the most information in the least time

The material includes chapters on methods of research anti-metabolites, biological oxidation, carbohydrates, alcohols and aldehydes, bases, proteins and amino acids, fats and lipids, pyrroles, nucleotides and related compounds, metabolism of aromatic substances, and localization of metabolic processes in cells Paper, printing, and binding are of good quality

Ocular Therapeutics By William J. Harrison MD. Ph.D. F.A.C.S. Associate Professor in Ophthalmology Jefferson Medical College Philadelphia Second edition Cloth \$6.50 Pp 282 Charles C. Thomas, Publisher 301 327 E. Lawrence Ave. Springfield Ill. Blackwell Scientific Publications Ltd. 49 Broad St. Oxford England Ryerson Press 299 Queen St. W. Toronto 2B 1953

Like its predecessor, the second edition of this stout pocket manual on ocular therapeutics provides instructive, useful information for busy, practicing ophthalmologists New data have been added on anticoagulants, ophthalmic uses of cortisone and corticotropin, antibiotics and the sulfonamides, isotonic solutions and buffered solutions, and vitamins The language is clear, concise and colloquial, and it is always very much to the point This book is recommended to younger clinicians

Praktische Arbeitsphysiologie Von Prof. Dr. Gunther Lehmann Direktor des Max Planck Instituts für Arbeitsphysiologie Dortmund. Cloth. 33 marks Pp 355 with 145 illustrations Georg Thieme Verlag Stuttgart 47 (14a) Stuttgart O. Agents for U.S.A. Grune & Stratton Inc. 381 Fourth Ave. New York 16 1953

This book takes up problems of work output in industry as related to the functions of the human body This branch of physiology is an essential part of the basis for occupational hygiene An introductory chapter classifies types of work according to the relative importance of the physical and the psychological elements involved Subsequent chapters deal with muscular work, conditions for muscular efficiency (problems of posture and fatigue), energetics (metabolism), the rational planning of machinery and optimum working conditions, environmental factors including radiation and ventilation, composition and pressure of the air, problems relating to the ear

and eye, relation of nutrition to work output, evaluating and encouraging efficiency, and optimum duration of work periods

There is a glossary and an index, and bibliographic references follow each chapter In a few places (e.g., page 300) the author lapses into the complex sentence structure characteristic of some German textbooks, but generally his style is simple and direct, and the subject matter is made concrete by quantitative information and some good illustrations This book will be a valuable addition to every library devoted to industrial medicine and occupational hygiene

Grundzüge der physikalischen Therapie der Hals-, Nasen- und Ohrenkrankheiten Herausgegeben von Dozent Dr. A. J. Cernach. Unter Mitarbeit von Dozent Dr. O. Novotny Dozent Dr. L. Psennner und Primarius Dr. A. Riccabona. Teil II Die Röntgentherapie in der Oto-Rhino-Laryngologie Von Dozent Dr. O. Novotny 1. Assistent der I. Hals-, Nasen-, Ohrenklinik Wien und Dozent Dr. L. Psennner 1. Assistent am Zentral Röntgen Institut Wien Band IV Wiener Beiträge zur Hals-, Nasen- und Ohrenheilkunde begründet von Prof. Dr. Camillo Wieth Paper 15 marks Pp 105 with 22 illustrations. Wilhelm Maudrich Alserstr. 19 Vienna VIII/65 1953

This paper bound volume is the second of a set of three dealing with physical methods of treatment in diseases of the ear, nose, and throat The other two volumes will deal with the therapeutic use of light, electricity, radium, and inhalations, the present volume deals solely with roentgen rays It is divided into two parts, the first devoted to general considerations of technique and dosage and the second to particular consideration of the outer ear, middle ear, nose (with accessory sinuses and nasopharynx), mouth, pharynx, larynx, and esophagus The author presents his subject in succinct, concrete form Illustrations and statistical data supplement the text The bibliography of 48 references is confined to European publications, but the text reflects current American thinking as well The book is recommended to those who read German

Pédiatrie Par Robert Debré et Marcel Lelong. Avec la collaboration de Stéphane Thieffry et Jean Rivron et al. Collection médico-chirurgicale à révision annuelle Directeur général Pasteur Vallery Radot. Secrétaire général Jean Hamburger In 2 volumes. Loose-leaf Cloth. 14 500 francs Pp 1154 1159 2234 with 388 illustrations Editions médicales Flammarion 22 rue de Vaugirard Paris-VI* 1952.

An outstanding attribute of these volumes is the loose-leaf form that permits the addition of supplementary material These books might well fill the gap between standard textbooks, which require frequent revision, and the more extensive and expensive works on pediatrics, which are difficult to keep up-to-date The volumes have adequate, technically superior illustrations The material is well organized, with useful cross references

Apparently much of the world literature was not available to the authors, as a considerable amount of the material is not up-to-date, and the bibliographies at the end of the chapters are made up primarily of other textual material Many outstanding contributions have been made by French pediatricians and by the authors, but these two volumes do not represent current pediatric knowledge This book may be intended for the use of general practitioners in France, but the content would not be suitable for this purpose in the United States

Artificial Light and Photography A Treatise on Artificial Light Sources and Their Application in Photography By G. D. Rieck and L. H. Verbeek With foreword by A. L. M. Sowerby B.A. M.Sc. FRPS English translation of this work is by G. Ducloux-Sutton (England) Cloth \$8.25 Pp 326 with illustrations. [Elsevier Press Inc. 402 Lovett Blvd. Houston 6 155 E. 82nd St. New York] N. V. Philips Gloeilampenfabrieken Eindhoven Netherlands 1952.

The subject of artificial light and its application to photography is very well covered by the authors Various types of artificial light sources, such as incandescent and fluorescent light, gas discharge tubes, and flash bulbs are discussed in detail Although sections of the book are highly technical, there are many examples of lighting problems encountered by the advanced amateur as well as by the professional photographer Only a page and a half is devoted to a general discussion of clinical photography The over-all format of the book is excellent The illustrations, four of which are in color, are outstanding The basic material presented will be valuable to clinical photographers, professional and commercial photographers, and the advanced amateur

QUERIES AND MINOR NOTES

THE PREVENTION OF KIDNEY STONES

TO THE EDITOR—A patient of mine, aged 47, has had kidney stones for 20 years. He has had many cystoscopic examinations and has had stones removed from both kidneys several times. He passes small stones every day. He has tried every diet obtainable and about every medicament recommended. He read an article about some colloid that was used for such a condition and asked me to find out about it.

Wallace R. Smith, M.D., Grand Marais, Minn.

ANSWER—The article read by this patient probably referred to treatment of urinary calculi by subcutaneous injections of hyaluronidase. Butt and Hauser (*New England J Med* 246:604, 1952) stated that such injections increase colloidal activity of the urine and thereby prevent crystalloids from coalescing and forming a stone. The dose and frequency of injections are determined by noting the ability of the drug to convert macroscopically cloudy urine into macroscopically clear urine. It appears that 150 to 900 turbidity reducing units injected at 24 to 72 hour intervals are necessary to keep the urine clear. Helsby and co-workers (*J Urol* 69:354, 1953) noted that injections of hyaluronidase failed to prevent formation of stone about a foreign body placed in the bladder of rats. They hasten to point out, however, that their experiments do not refute the claim that hyaluronidase prevents formation of stone in humans and suggest that this notion will have to be substantiated by further observations. Sufficient time has not elapsed to permit corroboration of the efficacy of this form of treatment by other workers, so that any opinion given at this time is premature.

Prevention of the recurrence of calculi requires thorough investigation by a urologist. Determinations of the calcium, phosphate, phosphatase, and uric acid levels, carbon dioxide combining power and chloride content of the blood may be necessary in a search for the cause of calculus formation. The chemical nature of stones that have been passed or removed surgically must be determined and it may be necessary to examine the urine for cystine crystals. Urographic studies and bacteriological examinations of the urine are essential. These tests may indicate the cause of the stones and suggest a definitive form of treatment. Thus, hypercalcemia, hypophosphatemia, hypercalciuria, and hyperphosphaturia indicate hyperparathyroidism. The diagnosis can be corroborated by other studies, and treatment consists of excision of an adenoma of the parathyroid gland. Hyperuricemia may indicate that the calculi are composed of uric acid, although in the majority of patients with uric acid calculi the uric acid content of the blood is normal. If analysis of the calculi shows the presence of uric acid, a low purine, alkaline ash diet is indicated, in addition, sodium bicarbonate is prescribed in an effort to maintain the urine constantly alkaline, to take advantage of the increased solubility of uric acid in an alkaline medium. Hyperchloremia and acidosis may indicate deficient formation of ammonia by the kidney, resulting in excretion of fixed base and formation of calcium stones. Therapy consists of an alkaline ash diet and the administration of sodium bicarbonate. If analysis of the stone indicates cystine or if cystinuria is found, a low sulfur, alkaline ash diet and use of sodium bicarbonate are prescribed to keep the urine intensely alkaline and thereby take advantage of the increased solubility of cystine in an alkaline medium. Urographic studies may indicate the need for pyelolithotomy, nephrolithotomy, excision of a calyx, a plastic procedure, or nephrectomy.

If a causative factor cannot be discovered, specific treatment must be guided largely by analysis of the stone. A treat-

ment commonly employed in management of calcium stones is a low calcium diet and acidification of the urine by means of an acid ash diet and administration of ammonium chloride or ammonium nitrate. The effectiveness of this therapy is distinctly limited. The most satisfactory treatment employed for calcium phosphate stones consists of measures directed to reducing the urinary excretion of phosphorus. A diet low in calcium and phosphorus along with 80 to 180 cc of aluminum carbonate gel (Basaljel) in divided doses is prescribed. The aluminum carbonate gel combines with the phosphate ion in the bowel to form a highly insoluble aluminum phosphate in the intestinal tract, which is entirely excreted as such in the stool. Treatment of calcium oxalate stones is difficult, because an exogenous as well as an endogenous source of oxalate exists and precipitation of such calculi can occur in urine that is either acid or alkaline. The most satisfactory form of therapy consists of a diet low in calcium and oxalate. In addition, experimental evidence suggests that the addition of magnesium trisilicate to the diet is advisable. The diets mentioned above are described by Greene (*Urolithiasis*, in Conn, H. F. Current Therapy 1953, Philadelphia, W. B. Saunders Company, 1953, p. 441). Finally, certain general measures are advisable for patients with urinary calculi. A daily urinary output of 2,000 to 3,000 cc is the most important single factor. There is some evidence that daily administration of vitamin A (50,000 units) and thiamine chloride (3 mg) is helpful. A determined effort should be made to eradicate infection of the urinary tract with suitable antibacterial agents.

DIFFICULTY IN TREATING "SIMPLE ANEMIA"

TO THE EDITOR—I have been having difficulty treating simple anemia. For the past year, remedies that heretofore have helped these patients are failing to give results. Adequate amounts of ferrous sulfate and ascorbic acid do not seem to build up and maintain the hemoglobin and red blood cell levels. Liver extract injections sometimes give temporary improvement, but an exacerbation occurs during treatment with a minimum of two injections of 1 cc each a week. Vitamin B₁₂ given every other day also has failed to produce improvement. Is there anything different in the food available today? Could this situation be due to permeation of the air with residue from the explosion of atomic bombs? Other physicians in this community are having the same difficulty. Suggestions on treatment of these patients will be greatly appreciated.

M.D., Indiana

This inquiry was referred to two consultants, whose respective replies follow.—Ed

ANSWER—It may be presumed that the term 'simple anemia' refers to the hypochromic, microcytic anemia most commonly associated with a deficiency of iron. Chronic or repeated acute loss of blood is most frequently the cause, although nutritional deficiency and other conditions, such as malignant disease, may complicate the problem. Insufficient data are given on the dosage of iron used, the dietary intake, the cause of the anemia, and the variations observed in the blood cell counts and hemoglobin levels to permit specific answers. The following suggestions may help solve the problem. Administration of large doses of iron is often, and perhaps usually, necessary to maintain normal blood levels. Not less than 18 gm daily of any of the commonly available iron salts, given in divided doses, is desirable. A diet containing generous amounts of protein, vitamins, and iron should be followed. Any possible sources of blood loss should be carefully sought and eliminated, if possible. Of the less common sources, esophageal hiatus hernia, hemorrhoids, malignant lesions, and lesions of the genitourinary tract must be considered. Finally, the blood levels must be determined accurately, with standardized equipment and the greatest care.

in technique being used as insurance that variations in the blood values are real and are not due to technical errors. Liver extract and vitamin B₁₂ are not specifically indicated in this variety of anemia, although they may enhance the utilization of iron or the nutrient substances necessary for blood building in some persons. It is highly unlikely that the blood of persons other than those in close contact would be affected by atomic bomb explosions.

ANSWER—There is no possibility that the intermittent presence of radioactive residue from atomic bomb test explosions could have any bearing on anemia. After an atomic bomb explosion, the radioactive particles gradually descend to earth. Detailed and repeated measurements of their radioactivity have been made, and at no time has a level capable of affecting the hematopoietic system been observed. Actually, the amounts of radiation so received would be only a small fraction of the radiation received in a routine fluoroscopic examination.

NERVOUS INDIGESTION

TO THE EDITOR—A woman, aged 26, has complained of gas in her abdomen since 1949. She obtains some relief from belching but obtains more when she passes flatus. Repeated examinations have shown increased peristalsis. Gastrointestinal studies done in 1950 showed a moderate sized diverticulum of the lesser curvature of the cardiac portion of the stomach which retained the dye in the 24 hour film. The colon was extremely ptotic. Treatment has consisted of use of antispasmodics and methantheline (Banthine) tablets, correction of constipation and use of abdominal supports. Could the diverticulum cause these symptoms? What further treatment would you suggest?

Thomas W. Kredel, M.D., Indiana, Pa.

ANSWER—Diverticula of the stomach are rather rare. They occur usually at the cardiac end of the stomach on the lesser curvature near the cardia. Usually they do not give rise to symptoms and are found accidentally. These diverticula usually do not retain food and rarely exceed the size of a quarter or of a silver half dollar. The symptoms described, flatulence, gas, and intestinal spasm, are those of nervous indigestion and cannot be attributed to the diverticulum of the stomach. Treatment should consist of a diet restricted in starchy foods, sugar, and leguminous vegetables, nervousness can best be controlled by Pavatrine (β -diethylaminoethyl fluorene 9-carboxylate hydrochloride) with phenobarbital, one tablet after each meal. Constipation may be relieved by a liquid petrolatum preparation reinforced with phenolphthalein.

RECURRENCES OF RHEUMATIC FEVER

TO THE EDITOR—What is the accepted procedure in the prevention of recurrences in patients who have had one or more attacks of rheumatic fever?

M.D., New York

ANSWER—In the light of the pathological findings and the clinical course of rheumatic fever, the disease, in its subclinical episodes, should be regarded as a chronic hypersensitive state in which there is a great tendency to relapse, especially during childhood. Hygienic living conditions, understood as housing, clothing, and nutrition, are of primary importance. The predisposing environmental factors deserve more than casual, general advice (Traut, E. F. *Rheumatic Diseases, Diagnosis and Treatment*, St. Louis: C. V. Mosby Company, 1952, p. 425). A susceptible person, especially a child, should secure adequate rest and proper food, especially adequate amounts of protein. The patient should be protected against chilling and against contact with patients ill from or convalescing from acute respiratory tract infections. An environment with a warm climate and a low altitude, especially during winter and spring, is preferable. A reasonable intake of vitamins, such as are afforded by cod liver oil and citrus fruit, is desirable.

Removal of the palatine tonsils can be recommended in a patient having repeated sore throats, although tonsillectomy is no longer routinely employed as a preventive measure.

Vaccines made from hemolytic streptococci or from the throat flora of patients with acute rheumatic fever have been used. Institutionalization of persons susceptible to rheumatic fever may afford proper food, housing, and observation but is detrimental from the epidemiological standpoint, it places persons of like susceptibilities in close contact. Institutions also fail to meet the psychic necessities of childhood. Currently, attempts are being made to prevent infection with hemolytic streptococci and are reportedly successful. Administration of 0.5 gm of sulfadiazine daily to children and 0.5 gm twice daily to adults is recommended. More recently, 100,000 units of penicillin given orally daily before breakfast or 800,000 units of penicillin given daily for the first week of each month have been advocated as a means of keeping the pharynx clear of hemolytic streptococci. Administration of these drugs has been continued in such doses up to puberty. Besides the expense and tedium of carrying out such a prophylactic program, questions of its efficiency, expense, and possible harm must be thoughtfully considered. All of these measures take on increased importance the younger the subject and the more recent the evidences of active rheumatism.

ELECTRIC ARC WELDING

TO THE EDITOR—At what distance is electric arc welding harmful to a bystander's (not the operator's) eyes in broad daylight and under normal shop conditions?

Jacob L. Greenberg, M.D., Newark, N. J.

ANSWER—Within any harmful distance, the duration of exposure may be of greater consideration than the distance itself. Not all ultraviolet emanations from arc welding are the same. The output increases with amperage, which varies enormously. By some investigators, 200 ft. is accepted as a minimal distance for unprotected exposure for workers other than the operator or for bystanders. Regardless of the intensity of surrounding illumination, the output of ultraviolet light remains the same. Since eye damage from ultraviolet rays chiefly is to exterior structures, such as the cornea, the state of surrounding illumination is of no real consequence. On a bright, sunny day, the ultraviolet rays of sunshine would be added to those from the arc, but this is of little consequence. Only to a slight extent do ultraviolet rays reach the retina. To that extent, the size of the pupil is of some consequence for a single flash. Since in the inside of a plant the illumination is likely to be lower than on the outside, the size of the pupil may be larger and, consequently, slightly more vulnerable. For practical purposes, workers other than the operator at a distance greater than 50 ft. are ordinarily adjudged not to need eye protection, even though the exposure is continuous. It should be kept in mind that the introduction of protective barriers does not necessarily assure safety, because reflected rays sometimes are injurious.

INFLUENZA VACCINE

TO THE EDITOR—Is the routine use of influenza vaccine advisable?

Chancellor H. Whiting, M.D., Oneida, N. Y.

ANSWER—The routine use of influenza vaccine is thought by many not to be advisable except perhaps when an epidemic threatens. Maximum protection from influenza vaccine takes about two weeks to develop and, during an epidemic season, most persons may already have been exposed to the virus prior to preventive inoculation. It is believed that the vaccine offers adequate protection for a relatively short time, probably only three or four months. Little if any crossing of immunity between known major types of influenza virus has been reported. Therefore, it is necessary to know that the type of virus causing a particular influenza outbreak is contained in the influenza vaccine used to protect against this illness, and a polyvalent vaccine may help do this. Furthermore, there have been reports of sensitivity to the vaccine, so that there may be occasional reactions to this material if it is used routinely. There may be circumstances under which the physician may wish to use the vaccine for individual patients and for groups.

OVERWEIGHT AND LONGEVITY

TO THE EDITOR—*The literature indicates that the longevity of obese persons is considerably less than that of nonobese persons. Are there any studies that indicate that obese persons who have reduced their weight have thereby increased their life expectation and their protection against diabetes and circulatory diseases?* M.D., Rhode Island

ANSWER—A mortality study of overweight persons by Dublin and Marks of the Metropolitan Life Insurance Company in 1951 (*Tr A Life Insur M Dir America* 35:235, 1952), showed long range benefit from weight reduction. This study was based on persons who were limited to substandard insurance solely because of their weight. The study covered persons of this kind insured during the years 1925 to 1934 and traced to 1950. The mortality of all overweight persons in the study was significantly higher than that of standard risk persons. Out of this general experience, a separate study was made of those overweight persons who subsequently showed a reduction in weight sufficient to qualify them either for standard insurance or a lower rating than they had been given originally. Among both men and women the death rate after weight reduction was substantially less than that for all of the overweight persons studied. Among the men, the reduction was of the order of one fifth and among the women about one third. While these findings cannot be definitive, they are most significant. This is perhaps the best evidence produced to date that weight control pays and is also the most practical approach now available to the problem of preventing or retarding major degenerative diseases of middle and later life.

PAINFUL TOE

TO THE EDITOR—*A 52-year old man has had severe pain in the medial aspect of the dorsum of his right big toe for one year. It is most annoying during the night, preventing him from sleeping. No sensory changes or evidence of a lesion of the toe are present. He gives a history of treatment for syphilis 10 years ago. A blood Kahn test gives a positive reaction at 1:4 dilution. Neurological examination shows no abnormality. Division of a portion of the digital nerves to the toe on the dorsum of the foot relieved the pain for a week. The patient is receiving penicillin for his syphilis. Is the pain a manifestation of syphilis? If not, what cause and what treatment are suggested?*

John Clough, M.D., Massena, N. Y.

ANSWER—The only lesion of syphilis that is suggested by nocturnal pain in the big toe is a lesion involving the metatarsal or phalangeal bones. If a roentgenogram shows syphilitic periostitis or osteitis, the diagnosis should be obvious. Other possibilities are gout and rheumatoid arthritis. Pertinent laboratory tests for these two diseases, including determination of the blood uric acid level and the corrected erythrocyte sedimentation rate, should be done. A remote possibility would be diabetic neuritis, to exclude this, the urine should be examined for sugar, and a fasting blood sugar level determination should be done. Finally, if no adequate medical cause is found for this complaint, the possibility of anterior metatarsalgia must be considered.

SNAPPING IN JOINTS

TO THE EDITOR—*Please explain the audible snapping that occurs in joints (especially knees) that are otherwise normal. The sound is not accompanied by discomfort and usually appears in persons past the third decade.*

Frederick J. Balsam, M.D., Memphis, Tenn.

ANSWER—Audible snapping in joints, especially the knees, that are normal is due to thickening of the synovial membrane folds, loose bodies, or fringes in the joint. This may occur in young adults as well as those in the third decade.

METASTASIS FOLLOWING RADICAL MASTECTOMY

TO THE EDITOR—*A patient had a radical mastectomy for carcinoma of the breast one month ago. The incision is not yet completely healed. The pathological report is medullary carcinoma with metastasis to the axillary lymph nodes. There are no clinical signs of metastasis. Is x-ray therapy indicated for preventing recurrence?* M.D., Pennsylvania

ANSWER—Delayed healing after radical mastectomy is usually due to a relatively inadequate blood supply to the skin because of the nature of the operation, however, when advanced carcinoma of the breast is attacked surgically, the tumor can recur locally before healing is complete, and this possibility must be kept in mind. Should any suspicious looking tissue appear in the wound, biopsy is indicated. X-ray therapy would be indicated in this patient not only because of the possibility of persistent local disease but also because metastasis to the axillary lymph nodes has already occurred.

AMEBIC DYSENTERY

TO THE EDITOR—*Twenty eight years ago a patient lived in Venezuela for three years and had an attack of amebic dysentery. He was treated there with emetine hydrochloride. Three months ago he had an acute attack and was ill for several days. He was given emetine hydrochloride for three weeks and then chloroquine phosphate. His stools have been negative for ameba for 8 to 10 weeks. I would like to know whether this is a flare-up of the previous infection or a new infection. Amebic dysentery is rare in this community.*

John R. Thomas, M.D., Corpus Christi, Texas

ANSWER—If this patient was free of ameba, as indicated by repeated stool examinations, and free of symptoms of the condition for 28 years, the present attack would be considered a reinfection. This would represent the consensus of all workers with a large experience in the management of amebiasis.

BOOSTER TETANUS INJECTION

TO THE EDITOR—*Last autumn a 5½ year-old child had an attack of giant hives associated with transitory faintness. He ate lobster a few days prior to this episode. Otherwise he has never shown signs of allergy. He should have his booster injection for tetanus or preferably for diphtheria and tetanus this spring. Is he likely to have any untoward reaction? What precautions should be taken?*

Henry Korchmal, M.D., Meriden, Conn.

ANSWER—For the patient cited it is doubtful whether any severe reaction would be caused by a booster dose of diphtheria and tetanus toxoids. Nevertheless, it is well to observe caution. A Moloney skin test may indicate whether there is sensitivity to toxoid, however, intracutaneous injection of 0.1 cc. of the combined toxoids, plain, should be satisfactory for a booster. With this method, the possibility of the occurrence of unpleasant reactions is greatly diminished.

LABORATORY-ACQUIRED ANTHRAX

TO THE EDITOR—*We have a bacteriologist with anthrax, self inoculated in the laboratory, with the lesion just above the left eyebrow. We should appreciate knowing how often such laboratory infections with anthrax have been reported.*

M.D., Pennsylvania

ANSWER—At least 30 instances of laboratory acquired anthrax have been recognized in the United States as disclosed by a survey made in 1950 (Sulkin, S. E., and Pike, R. M. *Am J Pub Health* 41:769, 1951). The majority of these occurred in one large laboratory engaged in special studies and have been described in the literature. Most of the 30 infections were cutaneous, and only one was fatal. The suspicion that one infection was acquired by handling stained smears was supported by demonstration of viable bacilli on such smears.

CLINICAL EVALUATION OF PREFRONTAL LOBOTOMY

Lawrence C. Kolb, M.D., Rochester, Minn.

A survey made by the National Institute of Mental Health indicates that by the end of 1949 about 10,000 persons in the United States had undergone lobotomy or some form of surgical ablation of the frontal lobes of the brain for mental illness. The number of operations of this type had increased annually during each of the five preceding years. Thus, the interest in lobotomy has gained momentum since the procedure was introduced by Egas Moniz late in 1935.

The extensive surgical, anatomic, physiological and psychological studies that have emanated from the investigation of patients treated by this method have led to the collection of considerable new knowledge in regard to the functions of the frontal lobe and also have made apparent many deficiencies in that knowledge, for example, the majority of psychological techniques in use at present in the study of such patients are incapable of yielding information about deficits in intelligence on a high level that result from the operative procedure, although the failures in social adaptability and abstract thinking are evident to close family observers, social workers, and clinicians. In addition, physicians have been made aware of weaknesses in knowledge of the usual outcome of mental illnesses and of the noncritical manner in which therapeutic claims are frequently made in the field of psychiatry. Most of the reports on results of lobotomy published prior to 1947 failed to indicate whether the patients so treated were hospitalized or to give the duration of illness and hospitalization prior to lobotomy. No comparisons were made between the results obtained by lobotomy after long periods of follow-up and the known expectations for patients who did not undergo such operations. In some reports, outcome was defined successfully by stating the occupational adjustment of the patients, however, observations on the preoperative and preillness status of the patients were not made. In other reports, the outcome has been defined in terms of modifications of specific behavioral problems. From review of these reports it became apparent that the earlier statistical methods practiced in reporting of the outcome of the use of prefrontal lobotomy provided an

illusory impression of the worthiness of the procedure that could not be confirmed by comparison of the data available with earlier statistics on the long-term expectations in psychiatric illnesses. Detailed case reports, including long periods of postoperative observation, did suggest that many chronically ill patients were restored to a productive life in the community as a result of this surgical procedure. Even from these reports, it is not possible to decide what proportion of patients benefited as the result of the operation and what proportion benefited as the result of preoperative attention, which has a psychotherapeutic effect. The indication that the latter factor cannot be ignored was made apparent in the Greystone Park investigation of topectomy, in which 3 of 24 chronically ill control patients, who were treated in every respect as the group that were subsequently operated on, recovered sufficiently to be paroled from the hospital at the same time that 9 of 24 patients who were operated on were paroled. Later reports showed that 7 of the control group and 8 of the group operated on were out of the hospital. Also, necropsy that failed to show any significant lesion in the brain of a recovered patient who had presumably undergone lobotomy has been reported.

On the basis of my earlier critical review, it was suggested that the field of psychiatry might profit by adopting the suggestion of Penrose, namely, that reports of the outcome of therapy be withheld until five years have elapsed after termination of treatment. This technique has been adopted with success by surgeons and radiologists in judging the therapeutic effectiveness of treatment for malignant processes.

In the past five years data have accumulated that allow a much better appraisal of the value of prefrontal lobotomy. Many of the questions unanswered in 1947 have now been clarified, although new problems have arisen through the application of such modified techniques as transorbital lobotomy, topectomy, thalamotomy, undercutting of the cortex, and anterior cingulectomy. Since these procedures have not been used over a sufficient period to allow satisfactory evaluation of their therapeutic potentialities, it has been decided to avoid discus-

sion of them at this time. The intent is, rather, to examine and discuss the indications for lobotomy, the available knowledge of its usefulness, and the known common complications of the procedure.

INDICATIONS FOR LOBOTOMY

Lobotomy has been recommended extensively in the treatment of the hospitalized psychotic patient, with the ultimate aim of effecting a social recovery outside the hospital. It also is used for the control of the dangerously suicidal, assaultive, or destructive patient in whom social recovery is unlikely. The procedure has been done on overactive psychotic patients who have physical disease, such as tuberculosis, that may be seriously influenced by the behavioral abnormality. It has been applied in the treatment of the ambulatory, nonhospitalized, psychotic patient and various types of neurosis. It has been used for psychopathic states, drug addiction, organic behavioral disturbances, and intractable pain of physical or psychic cause. It is generally recognized that lobotomy provides only modification of certain symptoms. It is not a specific therapy in any sense. This is clearly demonstrated in such reports as those of McLardy and Davies, who have found that relapse may occur, with recurrence of all symptoms noted preoperatively, even when as extensive a procedure as bilateral prefrontal lobectomy is performed.

There seems to be fairly general agreement that certain specific symptoms are more likely than others to be modified by lobotomy. Suicidal tendencies, refusal of food, depression, anxiety, hypochondriasis, assaultiveness, destructiveness, impulsiveness, and overactivity are likely to be influenced favorably by lobotomy in more than 75% of the cases. Delusions and hallucinations are less likely to be modified, although the patient does not respond with as great emotion to the disordered thought process. Apathy, indifference, withdrawal, untidiness, or inappropriate emotional responses of long standing are behavioral patterns that are seldom modifiable by this procedure and are considered by some as contraindications for the operation. Certain features suggest a favorable outcome from lobotomy for the illnesses of certain hospitalized psychotic patients. These are sudden onset of illness, short duration of symptoms, a good prepsychotic personality, and plasticity of symptoms, however, experienced psychiatrists have long been aware that these factors indicate a favorable outcome even with conservative treatment.

There is, at present, a growing insistence by some that lobotomy be performed as early as possible in order that patients may obtain the benefit of the operation before symptoms become fixed. It is true that few patients with chronic psychotic processes respond, and the hopes of therapeutic success in such patients frequently are not realized. There seems little justification at this time for supporting the contention of those who press for early operation. The reason for this point of view is easily demonstrated. Penrose, in his study of outcome of various therapeutic methods used in the public mental hospitals of Ontario, Canada, over a five year period, found that at the end of one year about 50% of the hospitalized, psychotic patients who were not treated by shock had been discharged from the hospitals. At the end of two

years this figure was almost 60%. Few discharges took place in this group after the end of the second year. There is, at present, no way of selecting the 60% of psychotic patients who will recover with conservative care during the first two years of hospitalization. Those who advocate lobotomy prior to the end of the second year of hospitalization have not had sufficient experience to justify the use of the procedure on the 6 of 10 patients who will recover sufficiently without operation. Those who contend that lobotomy is often delayed too long do, however, have a point. Several excellent follow-up studies indicate that patients who have been hospitalized for more than five years are unlikely to receive much benefit from the procedure, although in some instances behavior in the hospital may be more circumspect after operation.

Lobotomy seems to offer a better opportunity for increasing the rate of discharge of patients hospitalized for more than two years. This fact is attested by several recent reports. That from Pilgrim State Hospital, New York, by Worthing and his associates, showed that a 10% release rate continues into the 12th year of hospital life when lobotomy is used. Yet, the quality of remission is much less satisfactory in patients operated on late in the course of their illness.

SELECTION OF PATIENTS

The following factors must be considered in selection of patients for lobotomy. A major factor working against the social reintegration of the patient who has had a lobotomy, as with any mental patient, is the attitude of the family or those on whom he is dependent. This factor has been commented on by many. The willingness of the family to accept, support, and direct the rehabilitation of the patient who has undergone lobotomy and shows the exaggerated dependence so commonly the result of the brain lesion is of such importance that the Greystone Park investigators of topectomy had their social workers develop a rating scale to evaluate the responsibility of the family for their relatives. Interviews with the family to explain the personality changes that occur after lobotomy are recognized as a necessity to effect a favorable extrahospital outcome. The failure of the family to adjust to the returned patient often results in his readmission to the hospital. In some instances, this failure is due to the continuing existence of the psychosis or to appearance of symptoms secondary to the frontal lobe lesion indicative of social irresponsibility that few families can tolerate.

The varying effects of the return of such patients to their families have been described in several articles. Partridge reported on the rehabilitation of a family following operation on the psychotic member. Koskoff, on the other hand, indicated that a family's equilibrium was disturbed by the changed behavior of a wife who was successfully relieved of a chronically painful condition by prefrontal lobotomy. The anxiety caused by her outspoken and unpleasant postoperative behavior induced disturbances in her husband and daughter that led to their respective breakdowns with a gastric ulcer and schizophrenia. The difficulties of family acceptance of the patient treated by lobotomy have been discussed also by various social agencies.

Probably the most important single factor in selection of a patient for lobotomy is evidence that he is responding emotionally to his environment. Patients who offer a series of desperate complaints, who are aggressive, anxious, or restless, or who betray evidence of disturbed autonomic functions, such as large pupils, dry tongue, tachycardia, or cold, moist hands, are more likely to benefit than those who are withdrawn, apathetic, and dull. Certain rating scales of behavior have been devised in an attempt to estimate the patient's potential for recovery.

Another matter of prime importance that must be considered before the decision to operate is made is the occupational status of the patient prior to the onset of his illness. It has been the common experience that those who are employed in simple occupations are more likely than others to return to a similar form of work after lobotomy. Freeman and Watts early stated that no physician, dentist, artist, musician, or writer had resumed his profession after lobotomy. The inability of those whose skills demand a high degree of social adaptability, tact, and creativeness to return to their chosen work is probably the result of the deficit induced by the frontal lobe lesion. In the past few years, the return of a few nurses and physicians to gainful employment after lobotomy has been reported, but whether the level of their activity is as high as that prior to operation is not easy to ascertain. It is a serious matter, indeed, to recommend frontal lobotomy as treatment for anyone with particular social or creative talent if there is any hope of recovery through more conservative measures.

The age, sex, religion, and education of the patient have not been found to have major significance in the selection of patients for operation, although the existence of cerebral degenerative processes in the elderly patient suggests a poor outcome. It is of interest that twice as many women as men have undergone this operation in the United States.

EFFECTIVENESS OF LOBOTOMY

When the effectiveness of lobotomy for treatment of specific reaction types is considered, there seems to be a general conviction that the procedure is of most value in the treatment of the less disruptive personality disorders, such as obsessive and compulsive states, certain hypochondriacal reactions, and the involutional depressions. Manic-depressive psychoses respond more favorably than do schizophrenic reactions, however, a study of the number of patients operated on in each category compiled from seven recent reports with follow-up investigations showed that about 60% of the patients had schizophrenia, 25% had affective psychosis including the involutional states, 10% or less had obsessive, compulsive neurosis, and the remainder had scattered conditions, including psychoneurosis, psychosomatic conditions, psychopathic states, organic psychoses, mental defects, epilepsy, and painful conditions.

Prefrontal lobotomy has not been shown effective in relieving schizophrenia. Experience makes it clear that it offers little to the vast majority of patients who form the bulk of the patient load in our mental institutions. This is due to the fact that most of them fail to have the symptoms, previously mentioned, that are generally affected

by the procedure. Yet the procedure has led to the return to the community of a number of schizophrenic patients who had been hospitalized for two or more years and who were unlikely candidates for discharge. Furthermore, it is generally agreed that the use of lobotomy in chronically disturbed and destructive patients often has led to subsidence of such behavior. Such symptomatic modification has eased the burden of hospital management, even though social readjustment with discharge has not always ensued. The suggestion that our state institutions will be emptied by the use of the procedure should, however, be considered an expectation that cannot be fulfilled.

Opinions differ with regard to the type of schizophrenic reaction most likely to be benefited by the operation. Some state that the periodic catatonic type responds best and that the hebephrenic, paranoid, and simple reaction types respond less well in the order mentioned. Others have reported better success with hebephrenic and paranoid reactions. This difference in opinion is perhaps due to the well-known variations in diagnostic criteria for schizophrenia and its subgroups from one hospital to another and the fact that patients with this illness may manifest from one time to another during its course catatonic, hebephrenic, or paranoid symptoms.

The quality of the improvement obtained by prefrontal lobotomy is best illustrated in the follow-up study by Partridge, who personally reexamined 158 schizophrenic patients treated by psychosurgery. Of 74 patients initially discharged from the hospital, 16 were still psychotic at time of dismissal, 2 of whom had relapses, 16 showed psychotic traces at time of dismissal, 2 of whom had relapses. Thirty-six were discharged as recovered, 7 of these had relapses and 4 recovered after the relapse. Six psychotic patients were discharged against advice. In other words, while 46.8% were discharged from the hospital, many still manifested evidence of the psychotic process. The eventual adjustment of such discharges is worthy of further study at a later date. A number will be returned to the hospital when their dependent needs cannot be met by their families and the community. It is of interest that of the original 19 schizophrenic patients operated on under the direction of Moniz, only 3 were well 12 years later, initially, 5 were discharged in remission.

While five years ago relatively few patients who had manic-depressive psychoses had been treated by psychosurgery and followed for any period, now a significant number have been observed. The extremely variable course of this illness makes any evaluation most insecure. Certain impressions are available, however. The outcome is more satisfactory among patients with predominantly depressive illness in whom the duration of the attacks is reduced, their severity mitigated, and periodic recurrence fragmented. The existence of manic features is an ominous sign so far as expectation for social recovery is concerned. The poor outlook for the elated patient is not modified whether the surgical procedure is performed during or between manic phases. The procedure does not fully control either phase of the manic-depressive psychosis, but manic behavior is less commonly modified. Furthermore, patients with manic-depressive psychosis who have aggressive thoughts prior to lobotomy are likely

to have frank antisocial behavior following it. In Stengel's study, only 5 of 75 patients failed to reveal features of a frontal lobe syndrome after operation. To many, the personality distortion caused by this syndrome is not considered of major significance in comparison to the gross symptoms of the illness for which the operation is performed.

The so-called involutional psychoses have responded well to prefrontal lobotomy. Of 273 patients treated by five different groups, 61% were able to leave the hospital. The obsessive-compulsive neurosis also responds to prefrontal lobotomy. Some patients have been reported relieved of their obsessive thoughts and compulsive behavior after operation, while others maintain their symptoms but no longer are so driven by them. Occasionally persons with obsessive-compulsive neurosis may become aggressive after lobotomy and exhibit the behavior pattern reminiscent of the antisocial psychopath. Patients with this neurosis, when treated by psychoanalytic methods, show a rate of improvement equally as impressive as that from lobotomy. If psychoanalysis is practicable, it should be advised before lobotomy is considered. Psychoanalysis by its nature is limited to patients who are reasonably intelligent, who are within rather narrow age limits, and who live in areas in which this therapy is available. Lobotomy may be considered when psychoanalysis has proved ineffective or when this treatment is not available. Lobotomy is a doubtful procedure in the treatment of obsessive-compulsive neurosis in which the person is capable of an active and productive social and occupational life.

In general, the treatment of the antisocial or sexual psychopath has not been successful. On the other hand, there have been reports of modification of deviant antisocial or sexual behavior. The probable explanation for the differing response may lie in the force motivating the type of behavior. In the psychopath whose deviant behavior is an expression of failure to develop a good conscience, the frontal deficit produced by operation, which usually lowers inhibitions, only leads to exaggeration of previous unfavorable behavior traits. On the other hand, when antisocial behavior is an expression of a compulsive drive arising as a substitution for some deep-seated unconscious conflict, the surgical procedure may lead to a lessening of this drive and, therefore, of the aberrant behavior trait. It is possible that better selection of patients on the basis of the psychic causation of their behavior may lead to a more successful, though circumscribed, range of usefulness of lobotomy in treatment of those with antisocial behavior.

The question has been raised as to whether lobotomy leads to deviant sexual activity in patients who had not displayed sexual abnormalities before. The eruption of homosexual behavior in both men and women has been observed following prefrontal lobotomy. Exhibitionism occurred in several patients after operation, and pedophilia occurred in another. It is not clear whether these patients expressed their aberrant sexual drives prior to operation or whether they became evident first in the postoperative period.

In a detailed study of sexual activity in 40 patients Levine and Albert found that 4 showed aberrant sexual

behavior in the postoperative period that involved them in social difficulties. One, a sexual psychopath before the onset of psychosis, returned to promiscuous behavior after operation. Another who had not been a social problem before operation became one. Two other patients who remained psychotic were in constant difficulty owing to their sexual verbalizations. In their series, homosexuality "did not arise anew" after operation. Levine and Albert concluded "that the predominant prelobotomy mode of sexual activity was maintained after lobotomy."

The successful treatment of patients with persistent pain by transection of the thalamofrontal radiations is probably the most significant new contribution to medical knowledge that has evolved from lobotomy. The observation that such patients no longer complain of pain although they retain their ability to perceive painful stimuli has emphasized the complexity of the problems of pain. Freeman has stated that few patients relieved of unbearable pain of organic disease have made good social adjustments following lobotomy. The procedure has been used with success to relieve the intractable pain of carcinoma, the thalamic syndrome, neurological states including tabes dorsalis, and the painful phantom. Unilateral lobotomy is often successful in the treatment of such conditions. Unilateral lobotomy has failed in patients who, in addition to having a known organic cause for their symptoms, also show evidence of a psychogenic disturbance. Yet, bilateral lobotomy succeeded in relieving pain in most patients in whom both physical and emotional factors contributed to the painful symptom. It is my impression that the decision to employ this procedure or the decision to undertake initially a unilateral or bilateral operation should not be made in any case until careful psychiatric evaluation has been carried out. Furthermore, such an evaluation should be made of any patient with a chronic painful condition before any neurosurgical procedure is undertaken. In some instances in which the pain is primarily caused by a physical lesion, lobotomy is initially preferable to chordotomy or neurectomy. In other instances, the opposite conclusion may be drawn as the result of a good neuropsychiatric study.

Prefrontal lobotomy is an effective form of treatment for patients whose painful complaint represents a part of a severe obsessive-compulsive neurosis or a psychotic state when these conditions have proved refractory to other forms of treatment, such as psychotherapy or electroshock therapy. In general, its use seems inadvisable for patients with hysterical or traumatic neurosis whose painful symptoms are frequently intermittent and seldom entirely incompatible with a reasonable social adjustment. The procedure is not to be recommended for psychoneurotic depressive states or obsessive states associated with pain and even addiction when the patient is found to be carrying important responsibility in business or at home. It is dubious whether it should be used when the patient with pain is managing successfully outside the hospital but is isolated, without relatives or friends, since the operative procedure may lead to such a severe reduction in productive capacity and such an increase in dependence that institutionalization may become necessary.

Procaine hydrochloride block of the frontal poles through a transorbital wound has been of aid in the selection of patients for whom prefrontal lobotomy may be indicated to relieve intractable pain. With relief of pain by prefrontal lobotomy it has been possible to withdraw narcotic drugs from patients addicted to them, provided this measure was instituted immediately after operation. Careful studies have shown that the symptoms of physiological dependence on narcotics, known as the abstinence syndrome, do occur when withdrawal of the narcotic is performed, although they are somewhat less intense in the immediate postlobotomy period. This is a matter of some importance. Sudden withdrawal of narcotics in a person strongly addicted may lead to serious abstinence symptoms in the postoperative state, which could be overlooked owing to the patient's failure to complain. At present there is no satisfactory means of assessing the value of prefrontal lobotomy in the treatment of other neuroses. Suffice it to say that satisfactory outcome may result from more conservative intervention.

RESULTANT COMPLICATIONS

The major complications that result from prefrontal lobotomy are as follows: the frontal lobe syndrome, convulsive disorders, urinary disturbances, certain surgical complications, and even death. The general practitioner may be called on to provide advice in regard to the indications and limitations of the procedure as well as to diagnose and manage these complications. It has been stated that lesions of the frontal lobe accentuate the basic features of the individual personality. Thus, patients who have been shy and withdrawn most of their lives may become more socially aloof. Persons with a personality leaning toward hypomania may show increased aggressiveness. The person who had a satisfactory social adjustment in the prepsychotic state is most likely to make the best adjustment after operation.

The most conspicuous and most disturbing deficit that has been observed as the result of prefrontal lobotomy is that best perceived by the patient's close relatives or friends and manifests itself in the patient's social behavior. Lack of tact is a frequent postoperative phenomenon, and the various uncouth, blunt, or facetious remarks made by the patient may become a source of embarrassment to the family. The patient's sense of personal responsibility for social behavior is lowered. Some degree of emotional dulling takes place. Judgment suffers considerably. The patient may no longer consider a group of related factors and come to a well-thought-out conclusion. Abstract reasoning and the ability to synthesize are impaired. Ability to plan activity beyond simple habitual routine suffers. Initiative is depressed.

The mortality rate from the operative procedure has varied from 3 to 6%. Postoperative convulsive disorders occur in 3 to 12% of patients. If a second lobotomy is performed, the incidence of convulsions is increased. Causes of death have been cerebral hemorrhage (especially from the anterior cerebral artery), abscess, meningitis, atelectasis, and pneumonia. The acute complications are generally recognized and treated during hospitalization. Occasionally, the physician may be called on to recognize a subdural hematoma or a brain abscess that may have become manifest some time after

the operation. The symptoms of these conditions are the same as those when the lesions are due to other causes. The postoperative management of convulsions may be necessary.

Although the family physician may have little to do with the immediate postoperative care of the patient who has had a lobotomy, he may be responsible for long-term home care. He may be required to decide what measures should be taken in regard to the unusual behavior of the patient that has become embarrassing to the family. The patient's disturbance may, for example, become manifest in some socially unacceptable behavior, or he may be considered "dangerous" to the community for one or another reason. If there is grave cause for alarm or if the family is unwilling to accept responsibility, institutional care is indicated. The recurrence of the original psychotic symptoms is also an indication for advising this step.

The question of the daily program of activity needed to aid in the patient's readjustment may be presented for consideration. A comprehensive, yet stimulating schedule of daily activities has been found to assist the readjustment process. Such a schedule includes regular hours for meals, set personal and household routines, physical activity, recreational pursuit, work, hobbies, and even simple habit retraining for patients who exhibit difficulty in managing their toilet and bathroom habits. Return to his occupation may be attempted after a satisfactory home adjustment has been made. Few who have not returned to work within a year are likely to be profitably employed. Some of these may, however, be able to contribute productively in a less demanding occupation or by assisting with housework at home. Often a simple explanation to a prospective employer by the physician will do much toward obtaining a satisfactory job adjustment.

SUMMARY

Prefrontal lobotomy has proved, over 15 years' experience, to be a useful therapeutic procedure in the treatment of certain emotional disorders and cases of intractable pain. It is symptomatic therapy that has proved most effective in relieving destructive drives, chronic depression and obsessions, hypochondriasis, impulsiveness, and overactivity. It seems to promise return to the community of a greater number of patients with chronic mental disease who have been hospitalized for more than two years than does any other therapeutic procedure. Relapse, with full recurrence of the symptoms of the original mental illness, may occur after prefrontal lobotomy. There is evidence that patients who have undergone lobotomy are more sensitive to environmental stress after operation than before. While most patients show evidence of deficit due to the lesion of the frontal lobe, this defect often is not as disturbing as the emotional illness they had. Other complications frequently encountered are convulsions and urinary incontinence and urgency. The general practitioner may be called on to advise the family in regard to the indications for operation and the limitations and complications of the procedure. He may also assume active responsibility for care of such complications and assist the family in the rehabilitation of the patient at home and in the community.

CORONARY DISEASE AMONG UNITED STATES SOLDIERS KILLED IN ACTION IN KOREA

PRELIMINARY REPORT

Major William F Enos, Lieut Col Robert H Holmes (MC), U S Army
and

Capt James Beyer (MC), Army of the U S

The purpose of this paper is to describe and analyze the gross lesions found in the coronary arteries of United States soldiers killed in action in Korea. The histology will be discussed in detail in a subsequent paper as will such pertinent data as race, body build, and personal habits.

MATERIAL

Recently 300 autopsies were performed on United States battle casualties in Korea. Most of these soldiers were killed in action or suffered accidental death in front line areas. The coronary arteries were carefully dissected in all cases. No case in which there was known clinical evidence of coronary disease was included in this series.

The average age in 200 cases was 22.1 years. The ages in the first 98 cases were not recorded except that the oldest patient was 33. In the entire series, the youngest recorded age was 18 and the oldest 48.

FINDINGS

In 77.3% of the hearts, some gross evidence of coronary arteriosclerosis was found. The disease process varied from "fibrous" thickening to large atheromatous plaques causing complete occlusion of one or more of the major vessels (table 1).

Occlusion was considered complete only when the plaque had no free surface and was fused to the wall opposite its point of origin. A conservative attitude in estimating the amount of luminal narrowing was maintained throughout. No actual measurements were made.

TABLE 1—Percentage of Cases Showing Varying Amounts of Luminal Narrowing

Amount of Luminal Narrowing	% of Cases
"Fibrous" thickening or streaking causing insignificant luminal narrowing	3.0
Plaques causing luminal narrowing over	
10%	13.3
20%	6.3
30%	3.7
40%	3.0
50%	3.0
60%	1.7
70%	1.0
80%	1.3
90%	5.3
Plaques causing complete occlusion of one or more vessels	3.0

In several of the cases listed in table 1 as showing over 90% luminal narrowing, the plaques completely filled the lumen but displayed a free surface not fused with the intima. Hypertrophy was not observed in any heart examined. The size could not be correlated with the severity of disease found in the coronary arteries.

In the great majority of cases, the location of the lesions followed a constant pattern. If the lesion was found in the proximal third of the left coronary artery, it was usually thickest on the epicardial side of the lumen, whereas, if it was in the distal third of the artery just proximal to the bifurcation of the circumflex artery, it tended to as-

sume a more medial position. At the bifurcation, the plaque was constantly found on the wall of the left coronary artery directly opposite the ostium of the circumflex artery (fig 1). In the upper fourth of the anterior descending artery, the disease process was usually found on the medial posterior wall of the vessel. More distally, the posterior or myocardial side of the lumen was the common location (fig 2A). The medial branch of a bifurcating anterior descending artery was always more severely involved in cases showing extensive disease (fig 2B). In some cases, plaques were encountered on the epicardial side of the lumen of the anterior descending artery, these plaques were opposite the bifurcation of a septal branch.

The pattern of disease was not as constant in the circumflex artery as it was in the left and anterior descending branches. Streaking and/or plaque formation was oftenest observed on the superior and posterior walls of the proximal fourth of the vessel, while the next most frequent site of involvement was the posterior wall in the middle third of the vessel, usually opposite a bifurcation of the circumflex artery.

In the proximal fourth of the right coronary artery, small plaques were commonly encountered on the posterior wall opposite the adipose branches. Elsewhere in the right coronary, plaques were usually found on the posterior and superior walls. This was especially true at

the right border of the heart opposite the origin of the right marginal artery

Disease was most commonly found at the bifurcation of the circumflex artery and in the 3 cm of anterior descending artery distal to the bifurcation (table 2). In 54 of the 112 cases with lesions in the anterior descending

Fig 1—A plaque formation in left coronary artery opposite ostium of circumflex ($\times 4$) B detail of atheromatous plaque shown in A ($\times 14$)

artery, the disease process started at the bifurcation of the circumflex artery and extended down the anterior descending branch, usually on the medial and posterior sides of the lumen. In every instance in which the diseased anterior descending artery bifurcated in the first 2 cm, the deposition of atheromatous material appeared to be intensified. The angle formed by the anterior descending and circumflex arteries is important. An angle approaching 80 degrees always seemed to predispose the artery to the development of a plaque. On the other hand, the disease process tended to be modified when the circumflex artery arose at the ostium of the right coronary artery, the vessel coursing around the base of the aortic and pulmonary arteries to assume its usual position in the atrioventricular septum on the anterior surface of the heart. Minimal disease was found in the left coronary artery in three such cases.

COMMENT

It is apparent that the lesions are commonly located at or near points of bifurcation, this gives the impression that hemodynamics in the lumen about bifurcations must play an important part in the mechanism of plaque formation.

The phasic aspect of the coronary circulation is mainly the result of the aortic blood pressure and the contractions of the myocardium during the cardiac cycle. Gregg and Green¹ have shown experimentally that, during iso-

metric contractions and ejection, the blood in the deeper and more strongly compressed vessels in the myocardium is forced backward into the larger proximal channels. Wood² stated that, during systole, ventricular contractions prevent blood from flowing through the coronary vessels that penetrate the left ventricular muscles, while the larger arteries on the surface dilate to form an elastic reservoir that recoils during diastole and acts as an accessory pump forcing the blood onward. During ventricular relaxation, the blood is able to flow through the vessels penetrating muscle, because it is propelled by the aortic diastolic pressure and by the recoil of the elastic reservoir. The compression of the intramural arteries is, as noted by Friedberg,³ less in the right ventricle.

We maintain that eddying about bifurcations of the coronary arteries, occurring during the diastolic recoil of the dilated coronary arteries, is a dynamic factor in the mechanism of plaque formation. As has been shown, the most frequent sites of plaque formation are on the medial wall of the left coronary artery at the bifurcation of the circumflex artery and on the medial and posterior sides of the proximal fourth of the anterior descending artery. The severest disease was found in those cases in which the bifurcation of the circumflex artery formed an 80 de-

Fig 2—A large plaque on myocardial side of anterior descending branch ($\times 12.5$) B large plaque in medial branch of a bifurcating anterior descending artery ($\times 18.5$)

gree angle and the anterior descending artery gave rise to a large branch just distal to the origin of the circumflex artery. It is postulated that under such conditions

eddy of blood in the left and anterior descending arteries traumatizes the intima and, thus, starts the vicious circle of plaque formation

Many factors have been mentioned as the primary cause of coronary arteriosclerosis. Heredity has been accepted by many as an important agent in the develop-

Fig 3—Thick intima in artery of a young Korean prisoner of war ($\times 335$)

ment of coronary disease. This may be manifested in the inherited pattern of coronary artery distribution. It has long been realized that coronary artery disease is much commoner in young men than in young women⁴; this suggests a hormonal factor. Boas and Ludwig⁵ have shown experimentally that testosterone stimulates the formation of connective tissue, while estrogens inhibit connective tissue formation. Some investigators have emphasized the ratio of serum cholesterol to phospholipids. According to Gofman and associates,⁶ at any total serum cholesterol level, the S_r 12-20 and S_r 20-100 classes of lipoproteins are higher in patients with coro-

nary disease than in normal subjects.⁷ Winternitz, Thomas, and LeCompte⁸ demonstrated with histological preparations and carefully executed reconstructions that intramural hemorrhage may furnish the bulk of cholesterol material in arteriosclerotic lesions, while Wartman and Laipply⁹ produced intramural hematomas experimentally and caused sclerosis in 30% of their cases. Saphir and Gore¹⁰ presented evidence of an inflammatory basis of arteriosclerosis.

Of special interest is the work of Dock¹¹ in which he demonstrated that the coronary intima of the male newborn is thicker than the intima of the female newborn. Zink¹² and Lack¹³ maintain that this phenomenon occurred only at points of bifurcation.

Most investigators are of the opinion that these areas of thickening are developmental irregularities representing prearteriosclerotic or early arteriosclerotic lesions.

It is interesting to note that the intima of the coronary vessels in young Koreans is thick (fig 3), although coronary atheromatosis is said to be rare in that race. Here we have an anatomic feature indicating stress, but plaque formation is rare. This would strongly suggest dietary factors. It is most unlikely that one factor alone can be indicated as the cause of coronary sclerosis. The findings presented in this paper indicate wear and tear on the intima caused by eddy of blood at points of bifurcation. However, other basic factors, such as hormones and diet, must be present before the disease progresses to plaque formation.

Two important points should be emphasized in view of observations made in this study: 1. Thrombosis occurs more commonly in diseased arteries, especially in cases in which extensive trauma and shock exerted their influence (fig 4). 2. In cases of sudden or clinically un-

Fig 4—Thrombosis of anterior descending artery in a 21-year-old white man who died three days after severe injuries ($\times 215$)

explained death of young men, the presence of a completely occluded coronary artery is not necessarily the cause of death.

SUMMARY

The coronary arteries of 300 soldiers killed in action were dissected. The average age of the men in this group was approximately 22.1 years. In 77.3% of the cases,

PRIMARY RESECTION OF THE COLON IN ACUTE ULCERATIVE COLITIS

Charles B Ripstein, M D, Brooklyn

Acute fulminating ulcerative colitis is a serious disease that carries a very high mortality. The acute attack may be an exacerbation of preexisting disease or it may represent the first manifestation of colitis in a previously apparently healthy person. In either case, the patient is acutely ill with high fever, diarrhea, bloody and purulent stools, and an overwhelming toxemia. There is often evidence of peritoneal irritation or frank peritonitis. Because these patients are so acutely ill, there has been a tendency to avoid surgical treatment, and, when it has become inevitable, simple ileostomy has been accepted as the operation of choice.¹ The results of this therapy have been poor, and the mortality has ranged from 20 to 60% in reported series of cases. In analyzing the deaths that have occurred in the past, certain facts become apparent. 1 The majority of patients show evidence of severe blood and protein loss, and this continues even in the presence of a functioning ileostomy. The blood loss may amount to 200 to 300 cc and the protein loss to 150 to 200 gm in 24 hours. The source of this loss is the diseased colon, and replacement in a severely ill patient is difficult and at times impossible. Ileostomy adds the factor of fluid and electrolyte loss. 2 Infection is an important factor in mortality. Sepsis and toxic absorption are universally present, and perforation of the colon is common (it occurred in 20% of fatal cases). The source of infection is primarily the diseased colon (fig 1).

Since all of these factors are derived from the diseased bowel, the logical solution would be its removal, and, since primary resection of the colon is so well tolerated in debilitated patients with chronic ulcerative colitis,² it has appeared worth while to evaluate the use of this procedure in acute fulminating cases of the disease. My experience with primary colectomy now covers 120 cases of ulcerative colitis, and in this group there have been five operative deaths. Forty-three of these cases fall into the acute category, and it is this group I wish to consider in detail.

INDICATIONS FOR SURGERY

Since acute ulcerative colitis responds to medical therapy in many cases, it is obvious that any radical surgical procedure should be reserved for cases in which it fails. This fact has led to the attitude that surgery is indicated only as a last desperate measure, and patients are referred for surgery in moribund condition. In an attempt to avoid this, I have adopted the following indications for surgical treatment. 1 The first is failure of medical therapy to produce a remission within a three

week period. This period is arbitrarily chosen, but it has been my experience that if a patient does not begin to improve within three weeks, further delay is dangerous. During this interval, patients have been treated with transfusions, antibiotics, corticotropin (ACTH), methantheline (Banthine), and, in some instances, psychotherapy. Sixty per cent of the patients have responded to this treatment, and the other 40% have undergone surgical treatment. 2 The second indication is perforation, actual or impending. In the presence of frank peritonitis or free gas in the peritoneal cavity, surgical intervention becomes an emergency matter. In any patient in whom localized abdominal tenderness develops, impending perforation is suspected, and in these instances a plain roentgenogram of the abdomen often shows a markedly distended colon, with little or no evidence of small bowel dilatation. I have considered these findings an urgent indication for operation. 3 The third indication is the occurrence of continued or repeated bleeding, especially if hemorrhage is extensive enough to produce a shock state. This constitutes an urgent indication for surgical intervention. 4 The fourth indication is the presence of septicemia or metastatic infection, such as endocarditis, pyoderma, or arthritis, which must be treated by removal of the primary focus after administration of a preliminary course of antibiotics.

OPERATIVE TECHNIQUE

The technique of operation is simple and has become standardized. A left rectus incision facilitates mobilization of the splenic flexure and leaves the right side of the abdomen free for ileostomy. The colon is mobilized by freeing its lateral peritoneal attachments and detaching the greater omentum from the stomach. The mesenteric vessels are then ligated and divided, and the colon is removed to the level of the rectosigmoid. The terminal ileum is brought out through a stab wound in the right lower quadrant as a permanent ileac stoma. After the occurrence of two near fatalities from ascending ileitis, I adopted Dennis's³ suggestion of doing frozen section biopsies of the terminal ileum and resecting enough so that the exteriorized bowel is microscopically free from disease. The divided rectosigmoid is exteriorized

through a stab wound in the left lower quadrant I feel that the principle of exteriorization of all diseased bowel must be strictly adhered to to avoid leakage and peritonitis

The small segment of rectum is left in place, because I have felt that its removal would be too great a shock in

Fig 1—Microabscess in the submucosa of the colon in acute ulcerative colitis these abscesses represent the source of infection and toxemia

the poor risk patient I have carried out a total colectomy in four patients in the chronic group but in none of the acutely ill patients I have become convinced that a permanent ileac stoma is the price that must be paid for freedom from ulcerative colitis and that the rectal segment should be removed three to six months after the initial operation. It rarely heals after ileostomy and often gives rise to troublesome symptoms, such as bleeding, discharge, and fistula formation. In two cases, carcinoma has developed in the rectal segment. In four patients I have later anastomosed the ileum to the rectum, and in

Fig. 2 (case 1)—Course of patient J. N. showing the response to resection of the colon

three of these a recurrence of disease in the remaining colon has ensued. Two attempts at anal ileostomy have been failures because of severe excoriation of the anus, and I now feel that abdominal ileostomy, with use of the Rutzen bag, offers the most satisfactory solution for these patients.

RESULTS OF PRIMARY RESECTION OF THE COLON

In the past five years, one stage resection of the colon to the level of the rectosigmoid has been carried out in 43 patients with acute ulcerative colitis. All were in a toxic state, with severe diarrhea and fever of 103 to 105 F. In six patients, massive hemorrhage was a complicating factor, in eight perforation had occurred, and in three there was evidence of metastatic infection. Two cases were complicated by carcinoma of the colon. In all, medical therapy, including use of antibiotics, methantheline, and corticotropin had failed in a three week trial, or complications had ensued that necessitated emergency treatment. Two deaths occurred, one owing to ulcerative

Fig 3—The resected colon in case 1 this represents the length of bowel removed in the average case. The inflammatory process extends to the ileocecal valve.

endocarditis and septicemia in a patient who was moribund at the time of transfer to the surgical service and one postoperatively owing to peritonitis and intestinal obstruction. The remaining patients all recovered, one dying subsequently from carcinoma of the bowel. There were no deaths from ulcerative colitis on the medical service during this period. The following reports illustrate typical cases.

REPORT OF CASES

CASE 1 (fig 2)—J. N., a 30-year-old woman, was admitted to Maimonides Hospital Jan 4, 1952, with a history of intermittent diarrhea for five years. She had noted acute, crampy abdominal pain, fever, and the presence of blood and pus in the stools for two days prior to admission. On admission she was dehydrated and in a toxic state with a temperature of 104 F. The abdomen was slightly distended and tender, and sigmoidoscopic examination revealed an acutely hemorrhagic mucosa with many ulcerated areas. Despite aureomycin and methantheline therapy, the patient's course continued downhill. Corticotropin was given and produced a remission in the temperature, but the abdominal tenderness increased, and roent

genograms showed a distended colon. Since there was no clinical improvement after three weeks of therapy and since the signs of peritonitis were increasing, colectomy was performed. The bowel was extensively involved with severe ulcerative colitis, with walled-off perforations in several areas (fig 3). The postoperative course was uneventful, the temperature returning to normal within 36 hours and all toxic symptoms subsiding. This patient has continued to improve. She returned in three months for excision of the rectum because of local bleeding and fistula formation. Since that time she has led a normal life and has gained 40 lb (18.1 kg) in weight.

CASE 2 (fig 4)—R P, a 47-year-old woman, was admitted to Maimonides Hospital April 10, 1950, with a history of bloody diarrhea for three weeks and fever, weakness, and massive bleeding from the rectum for 10 days. On admission she appeared extremely ill and in a toxic state with a fever spiking up to 103 F. Sigmoidoscopic examination revealed a fulminating, necrotic, ulcerative colitis with pseudopolyp formation. She was treated with transfusions and antibiotics, but her fever continued and the toxic state became severe. Bilateral pleuritis and pericarditis developed, and the abdomen became distended and tender. Because of her rapid downhill course and the development of obvious peritonitis, colectomy was undertaken April 14, 1950. At operation, the entire colon was extensively involved with ulcerative colitis, with three areas of free perforation and a walled-off abscess in the region of the splenic flexure. The colon was removed to the level of the lower sigmoid, which was exteriorized. The postoperative course was stormy, but the patient recovered and is alive and well today. She has had a subsequent abdominoperineal resection of the rectum because of continued bleeding and discharge.

CASE 3 (fig 5)—W J, a 29-year-old man, was admitted to Maimonides Hospital Sept 19, 1951. This patient had had ulcerative colitis for 10 years, but 24 hours before admission he became acutely ill with severe abdominal pain, nausea, vomiting, and bloody diarrhea. At the time of admission he was in an extremely toxic state, with a rigid, tender, distended abdomen. Roentgenograms revealed free gas in the peritoneal cavity, and a preoperative diagnosis of colonic perforation was made. Immediate laparotomy was performed, and at operation acute ulcerative colitis complicated by carcinoma

Fig 4 (case 2)—Course of patient R P showing response to resection of the colon (Wycillin is crystalline procaine penicillin G)

of the transverse colon and a free perforation of the cecum was found. Colectomy and ileostomy were carried out, and the postoperative course was uneventful. The patient gained 40 lb (18.1 kg) in the next few months and was well for 10 months after operation, when he began to complain of back pain, which was found to be due to metastatic carcinoma.

COMMENT AND SUMMARY

It appears that primary resection of the diseased colon with ileostomy is the surgical procedure of choice in cases of acute ulcerative colitis that fail to respond to medical therapy. The operation may appear radical, but, in removing the source of blood and protein loss, elimi-

Fig 5 (case 3)—Course of patient W J showing response to resection of the colon

nating the focus of infection and toxic absorption, and forestalling the danger of perforation, it offers the patient a better chance of survival than does ileostomy alone. When ileostomy is performed without removal of the diseased bowel, the factors of fluid and electrolyte loss are added to the patient's burdens. An arbitrary interval of three weeks has been selected as the trial period for conservative management in these cases, if the patient does not improve in that time, operation is carried out. In the face of complications, such as hemorrhage or perforation, emergency surgery is indicated. The operation of primary colectomy was carried out in 43 patients with acute exacerbations of ulcerative colitis, there were two deaths in this group, a mortality of 4.6%.

4802 10th Ave (19)

Diagnosis and Treatment.—It was a common reflection a couple of decades ago that treatment lagged behind diagnosis, the physician was often accused of being more interested in the latter than in the former. In so far as the charge had reference to the common bacterial infections the lag has been eliminated. Indeed, the position has perhaps been reversed. There is in this field such a wealth of available resources in treatment that the temptation to 'get busy' with one or more of the sulpha drugs, or with one or other of the antibiotics, or indeed, with one or other of both of these, before the nature of the infection is fully ascertained, is almost irresistible. This is not always the doctor's fault, his hand is sometimes forced by the patient's anxious friends, who do not know, as does the doctor, that powerful remedies sometimes have 'side-effects' and that the patient's germ may have been rendered insensitive to the antibiotic when he badly needs it because he has already received it when it was not really necessary, or even indicated. But diagnosis is, after all, the alpha and omega of Medicine, and side by side with these slow advances in treatment came developments equally important, if less dramatic, in this sphere.—Lord Horder, M.D., *Fifty Years of Medicine, Journal of the Royal Institute of Public Health and Hygiene* March, 1953.

MODERN EXTRAPLEURAL PNEUMOTHORAX IN THE CHANGING TREATMENT OF TUBERCULOSIS

J W Cutler, M D, Philadelphia

Modern drug therapy and resectional surgery are producing dynamic changes in current thinking on the treatment of pulmonary tuberculosis. Pneumothorax, a long-established and flexible procedure, has been virtually abandoned in many institutions, because of possible complications, rather than limited to patients with proper indications. Thoracoplasty is decreasingly resorted to as an independent and definitive form of collapse. Extrapleural pneumothorax is seldom used because of prevailing prejudices. Pneumoperitoneum, an inefficient form of therapy and not without serious complications, is still popular in some quarters. On the other hand, resection is greatly on the increase and has become the treatment of choice with many physicians.

The development of streptomycin, *p*-aminosalicylic acid, and the isoniazid compounds has introduced new problems. Needed surgery is often delayed or neglected, with the hope that the new drugs will obviate all other therapeutic procedures. Overlooked is the fact that collapse or resection, or both, is ultimately needed in the great majority of cases to consolidate the gain achieved by bed rest and drug therapy, and the fact that surgery, if indicated at all, should be completed early in the course of therapy, when the tubercle bacillus is still sensitive to all the drugs. In the midst of such rapid and radical developments, the rules for good treatment in tuberculosis are still being formulated. Physicians, after all, are human beings too and, like other persons, are faddists to a considerable degree.

RESECTION

It is questionable whether the current marked trend to resection, on the assumption that resection is the best if not the only proper surgical approach, is really the best answer to the tuberculosis problem. It is possible to be overly enthusiastic about the newer benefits of resection and to forget the many valuable contributions good collapse therapy can make to recovery. This appears to be happening today. If the current trend is continued, a point is likely to be reached at which apparently little can be done for the tuberculous patient to assure recovery unless resection can be done, that is, unless the disease is sufficiently stabilized and localized for resection or can become so after months of bed rest and drug therapy and perhaps pneumoperitoneum. For the patient not so fortunate, this leads to a dreary, if not hopeless, outlook for a useful life, for he must depend solely on what drugs and institutional care can do for him. As a direct result of this trend, many patients are forced to stay in sanatoriums much longer than is really necessary or desirable, and the shortage of beds for tuberculous patients increases, although the death rate and incidence of the

disease is dropping. This is an unsatisfactory and unhealthy situation and is really not an advance in therapy. On the contrary, it is a step backward, as the following recent case well illustrates.

CASE 1—A white man, aged 35, married, consulted me on Feb. 2, 1953, and gave this history. He was first given a diagnosis of pulmonary tuberculosis on April 12, 1951, after a chest survey x-ray examination at his place of employment. There was moderately advanced disease, consisting largely of soft infiltration involving the middle two-thirds of the left lung field, with a small cavity in the outer zone of the second anterior interspace. There were also a few tuberculous deposits in the subclavicular area on the right. His general health was good, and for the most part he was asymptomatic. Tubercle bacilli were found in the sputum. On June 15, 1951, he was admitted to an institution, where he received rest, good food, all the antibacterial drugs available, a left temporary phrenic nerve interruption, and pneumoperitoneum. But his sputum continued to show tubercle bacilli, and on the whole the disease showed little resolution. The cavity remained open.

The patient, however, was getting restless. He was anxious to return home to a normal life and support his wife and child. In January, 1953, he asked his physician how much longer he would remain in the institution. He was told that at the rate his disease was improving it would take at least one more year before a limited resection could be undertaken and that another year of bed rest would be necessary after the operation to heal the diseased area that could not be removed by resection. He would have had three to four years of hospitalization, in other words, for a relatively mild case of moderately advanced tuberculosis, which before resection and chemotherapy could have been handled easily and effectively with therapeutic pneumothorax in a fraction of the time and at relatively little cost. As it was, intrapleural pneumothorax was not even suggested, let alone tried.

Resection and collapse, however, are not necessarily competitive or mutually exclusive procedures. On the contrary, they complement and supplement each other. But more important, they are needed in different types of patients. For instance, there are patients with special problems, such as a fibrotically stenosed bronchus, in whom collapse therapy is a predictable failure. In such instances resection is the answer. On the other hand, there are patients in whom the disease is so advanced and so badly distributed that resection cannot be considered at any time. In many such cases, collapse therapy has scored some of its most brilliant successes. Then again, collapse and resection have been combined successfully in the same patient. Both forms of therapy, resection and collapse, are valuable and necessary.

Most good results after resection are recorded in patients with roentgenographic evidence of limited or isolated and well-stabilized disease. But cases of such limited disease were never the real problem in tuberculosis therapy. It is the patient with the more advanced, more scattered, and less stabilized disease who constitutes the challenge and who represents the great majority of patients seeking treatment. For most of these patients reversible collapse, and not resection, is the better procedure. The problem, therefore, is a complex one, and it is important to keep an open mind. Obviously, integra-

This study was aided by a grant from the Wawa Foundation for Pulmonary Disease.

From Wawa Chest Hospital Wawa Pa., and the Department of Thoracology, Chester Hospital, Chester Pa. Dr. Cutler is an Associate in Medicine in the School of Medicine and Graduate School of Medicine, University of Pennsylvania and an Associate in Research, Henry Phipps Institute.

tion of therapy and careful planning of the over-all therapeutic attack to fit the needs of the individual patient are clearly indicated. Only in this way can the best interests of the patient be served. Such planning must also take into consideration the ultimate effect of the chosen therapy on pulmonary function, and all available methods of treatment should be employed, including, of course, collapse therapy. Important recent advances have taken place in this field, especially in extrapleural pneumothorax collapse, as well as in resection.

DEPRESSIVE EFFECT OF EXTRAPLEURAL COLLAPSE ON TUBERCLE BACILLUS

To fully appreciate extrapleural collapse, it is essential that one think of collapse therapy in terms of more than intensive rest. Important as this is, standing alone it fails to control the disease. Instead, one must think of collapse, first of all, in terms of a profound and long-continued depressive effect on the tubercle bacillus itself.

Extrapleural collapse deprives the bacillus (a strict aerobe) of vitally needed oxygen by preventing the normal replenishment of atmospheric air through closure of terminal bronchioles. This produces a specific inhibitory, even bactericidal, effect on the bacillus, similar to that produced by streptomycin and isoniazid, except that it is achieved mechanically by creating a serious oxygen deficiency at the point of disease. In this respect, extrapleural collapse is even more valuable than present drug therapy, for it is as effective against strains of bacilli resistant to the various drugs as against those still sensitive. Moreover, the inhibitory action of the extrapleural collapse can be maintained indefinitely, even for years after the drugs have lost their potency. This effect of collapse is poorly appreciated and is, therefore, rarely emphasized,¹ yet this is essentially the mechanism of cure by collapse. The supporting evidence of the injurious effect of oxygen starvation on the tubercle bacillus is voluminous and fully convincing.² Attention, however, should be called to the recent findings reported by Dubos.³ Dubos stated that oxygen deprivation not only disturbs the respiratory system of the bacillus directly in the manner stated but also alters unfavorably the biochemical environment within the necrotic lesion. He found that certain chemical substances, such as long-chain fatty acids and lactic acid, present in the tuberculous lesion, may become sufficiently bactericidal in low concentrations under semi-anaerobic conditions to kill the tubercle bacillus when its oxygen intake is lowered. A sort of chain reaction is thus set up, with chemical factors in the lesion acting as unexpected antituberculosis agents, "closing in" on the bacillus already weakened through oxygen starvation. Oxygen starvation of the bacillus, resulting from the walling off of the tuberculous process by the natural forces of the body so that the lesion does not communicate with a patent bronchus, and the action of the above chemical factors undoubtedly constitute part of the mechanism of spontaneous healing in tuberculosis.

Oxygen starvation of the tubercle bacillus is also the outstanding accomplishment in extrapleural pneumothorax. By preventing replenishment of atmospheric air through closure of terminal bronchioles, extrapleural collapse applies on a large scale, and in a controlled and

scientific manner, the very mechanism of cure so successfully employed by nature, for it converts open, oxygen-rich lesions into closed, oxygen-poor ones and prevents closed lesions from becoming open. Since closed lesions constitute a highly unfavorable environment for the survival of the bacillus, if kept closed by the collapse they invariably heal and need no resection.

A cavity in which the walls can be approximated and the draining bronchus closed behaves in the same way as a closed lesion. The tubercle bacillus, deprived of oxygen by the collapse and weakened still further by the chemical factors in the lesion, becomes attenuated, the infection subsides, and the cavity undergoes contraction and finally obliteration. It may leave behind no visible trace or may be represented by a few scars and calcified spots. The surrounding alveoli, in the meanwhile, expand.

Fig 1—Comparison of selective thoracoplasty done on the left and extrapleural pneumothorax on the right.

to fill out the space formerly occupied by the destroyed lung tissue. A good example, but not an exceptional one, is the disappearance of the large apical cavity (4 by 3.5 cm) in case 7 with extrapleural pneumothorax collapse. It is literally amazing how much of the diseased area,

previously refractory to all other therapy, can disappear under collapse and leave little or no trace behind

In retrospect, and viewed from the standpoint of the completeness of the collapse and the resultant degree of oxygen starvation, it becomes obvious at once that virtually all poor results in patients who are given collapse therapy can be attributed to inadequate, poor, or ineptly applied collapse. On the other hand, an area of lung well collapsed invariably heals, regardless of ultimate outcome. For instance, in ineffectual intrapleural pneumothorax there is always an area of lung that, by chance, is technically well collapsed. Such an area always improves, despite the fact that it is surrounded by progressive and fatal disease.

The whole question of what constitutes good treatment in tuberculosis has to be reevaluated in the light of these facts. If tubercle bacilli die or remain harmless in closed tuberculous lesions, as current studies on resected lungs

principle in the treatment of pulmonary tuberculosis. Extrapleural collapse provides the most intensive rest possible and does so for an indefinite period of time. It thus promotes healing of the lung in the same sense that a cast heals a broken leg.² Once the diseased portion of the lung has been physically reduced to a minimum by the collapse and the blood and lymph current slowed through mechanical blockage of these channels, toxemia with all its attendant symptoms disappears promptly and the sputum becomes normal. The relatively short time required for collapse to produce a feeling of clinical well-being and normal sputum is one of the wonders of modern medicine, with far reaching social, economic, and public health implications.

Extrapleural collapse, therefore, unquestionably represents sound scientific treatment, direct and definitive. Through suppression of the infection, it can alter in dramatic fashion the reaction of the lung in tuberculosis from one of apparent extreme susceptibility to that of apparent high resistance and thus give the healing forces of the body the opportunity and the time to create the necessary immunity, which alone can bring about lasting cure. Fully integrated with bed rest, supportive measures, and chemotherapy, extrapleural collapse can create miracles of healing.

INTRODUCTION OF EXTRAPLEURAL COLLAPSE

Although extrapleural pneumothorax is potentially the most useful of surgical procedures, it is also, unfortunately, one of the most controversial. The objective is to create a selective extrapleural pocket between the outer layer of the pleura and the chest wall and maintain it by air pressure. This is accomplished by mobilizing the lung extrapleurally after resection of about 5 cm. of the fourth or fifth posterior rib through a small paravertebral incision, beginning at the transverse process. In one case (fig. 1) thoracoplasty was done on the left side in September, 1941, and extrapleural pneumothorax on the right in October, 1950. The extent of the disease at the time of surgery was about the same in both upper lobes. The thoracoplasty resulted in a deformity, but the extrapleural pneumothorax did not, the latter procedure was much more complete. The patient is now in good health, is physically active, and has normal sputum.

Extrapleural collapse, of course, is not a new operation. It was first tried by Tuffier in 1891 for pulmonary hemorrhage. During the 30's the operation was popularized by Zorini (1933), Graf (1937), and Schmidt (1937). In 1940 Dolley³ and associates reviewed about 2,000 operations from 27 clinics and concluded that extrapleural pneumothorax should be instrumental in obtaining sputum conversion in 63% of the cases. In spite of these encouraging reports, the procedure soon fell into disrepute, particularly in this country, and it was, to a large extent, abandoned because of the numerous complications encountered and the relatively few good late results. Another reason for the current lack of popularity of this operation is the difficult and painstaking postoperative care and follow-up essential for a good result. In contrast to thoracoplasty or resection, the extrapleural collapse patient needs constant and skilled attention and protracted refills.

Fig. 2—Extrapleural pneumothorax in case of acute progressive tuberculosis. A, planigram study of right lung after unsuccessful intrapleural pneumothorax. B, seven weeks after successful right extrapleural collapse.

clearly indicate,⁴ and the disease heals, it would appear that major resection, with its needless sacrifice of lung tissue, increased operative risk, and prolonged hospitalization, may be ill-advised and collapse the procedure of choice. What is clearly and undoubtedly needed for many patients is a reversible collapse, similar to intrapleural pneumothorax but without its limitations and potential complications, one that will permit future use of the diseased lung after it has healed. Extrapleural collapse admirably fulfills these requirements, major resection or thoracoplasty obviously cannot.

Extrapleural collapse contributes still further to recovery.¹ Intensive rest is generally accepted as a basic

In retrospect, this operation was introduced too soon, in the preantibiotic era, and before lytic enzymes and the necessary technical improvements were developed. During the past few years, however, chiefly since 1946, the prognosis of this operation has materially improved, due to a number of factors: the availability of penicillin, streptomycin, and other antimicrobial drugs with which to control the infection of the extrapleural space, the return to simple extrapleural pneumothorax and the discontinuance of plombage, the use of streptokinase and streptodornase to overcome fluid coagulum and blood clots with attendant loss of extrapleural space, improvements in the technique of mobilization of the lung, especially the permitting of the mesial surface of the lung to remain adherent to the mediastinum, and other innovations evolved by those who have persevered in the face of discouraging early results.⁶ The serious complications that plagued extrapleural surgery in the past have, to a large extent, been eliminated or can be readily controlled. The very factors that have made resection practical have, by the same token, greatly improved the prognosis of extrapleural pneumothorax, and today old prejudices are no longer valid.

ADVANTAGES OF EXTRAPLEURAL PNEUMOTHORAX

Modern extrapleural collapse has many inherent advantages. As is evident from the accompanying illustrations and report of cases, extrapleural pneumothorax brings about the most complete and the most selective collapse possible, the ultimate in low oxygen therapy. In this respect it combines the stability of the collapse of thoracoplasty with the flexibility and versatility of the collapse of intrapleural pneumothorax, and it does so without the loss of function or deformity, or the uncertainty of cavity closure that may follow thoracoplasty, as well as without the adhesion problem, or complications or physiological disadvantages of intrapleural pneumothorax. Obviously, the more complete the collapse of the diseased area, and the better stabilized, the more intensive will be the local rest, the better the control of the toxemia, the more certain the conversion of sputum, and, above all, the greater the depressive, inhibitory effect on the tubercle bacillus. Extrapleural pneumothorax, therefore, is the most effective of collapse measures. It also offers greater security than resection, for it can bring under control virtually all the demonstrable disease in the treated lung, whereas resection is limited in its effectiveness to the area excised.

Extrapleural collapse is a one stage operation, non-deforming (fig 1) and well tolerated, even in poor risk patients with a low respiratory reserve. It can be combined with other forms of surgical therapy on the same or contralateral side or used bilaterally. This makes it possible to extend the benefits of collapse therapy even to the patient with extensively advanced bilateral disease who otherwise could not be considered for any type of surgery. It can also be used in patients desperately ill with acute progressive tuberculosis and in the presence of serious uncontrolled pulmonary bleeding, at a time when other forms of surgical intervention may be plainly contraindicated or too risky. In all such poor risk cases extrapleural collapse may be dramatic in its effectiveness and truly a life-saving procedure. The following case

histories are typical examples of the potential usefulness of extrapleural collapse in various types of cases: acute progressive tuberculosis, uncontrolled hemoptysis, advanced bilateral fibroulcerative tuberculosis, and cases of both young and old persons.

CASE 2—A white woman, aged 33, was seriously ill with acute caseocavernous tuberculosis involving the right lung when she came under my care on Aug 17, 1950. The entire right upper lobe was virtually destroyed through cavity formation, and infiltrative changes were noted in the remainder of the lung. The left lung was apparently free of disease. She had a temperature of 101 F, cough and expectoration, and hoarseness, and had lost much weight. Many tubercle bacilli were found in the sputum.

Intrapleural pneumothorax was unsuccessful because of adhesions and had to be abandoned (fig 2A). Thoracoplasty and resection were considered but were ruled out as too hazardous. The patient showed little improvement after therapy with streptomycin and *p*-aminosalicylic acid (isoniazid was not then available). A right extrapleural pneumothorax was performed on Sept 29, 1950, and the disease was well controlled, with all cavities closed within one month (fig 2B). The sputum became normal in March, 1951, and has remained so since. Her health is excellent today, 30 months after operation. She takes care of her home and leads a reasonably normal life.

Fig. 3—Case of far advanced bilateral disease. A Intrapleural pneumothorax on the left side had been unsuccessful. B eight years later the right side had collapsed with intrapleural pneumothorax (July 1 1945 followed by pneumonolysis) and the left side with extrapleural pneumothorax (May 1 1946). There is marked improvement in both lungs: the left extrapleural collapse is more selective and more complete than the right intrapleural collapse.

In this instance, extrapleural pneumothorax was not only dramatic in its effect but life-saving. Fortunately, since the availability of isoniazid, the chances of controlling the acuteness of the disease with drug therapy have been materially increased and the urgency for surgical intervention correspondingly lessened. Nevertheless one can foresee cases of patients with acute disease in whom all drug therapy may fail and collapse provides the only solution.

CASE 3—A white woman, aged 24, had advanced exudative tuberculosis with cavity formation involving the left upper lobe and bronchogenic spread to the right upper lobe, complicated by serious and continued hemoptysis. Intrapleural pneumothorax was tried on the left, but the collapse was ineffectual and had to be abandoned. The outlook appeared ominous. A left-sided extrapleural pneumothorax was established on May 9 1947, with complete success. This patient remains well today and lives a normal life, approximately six years after surgery.

CASE 4—A white man, aged 41, when first seen May 14, 1945, had far advanced, bilateral fibroulcerative tuberculosis with multiple cavities, the sputum showed tubercle bacilli (fig 3A). Intrapleural pneumothorax on the left side (May, 1945) was unsuccessful, but that done on the right side July 1, 1945,

6 Cutler J W Importance of Extrapleural Pneumothorax in the Collapse Therapy of Pulmonary Tuberculosis *J Thoracic Surg.* 21: 217 258 (March) 1951

was successful, after pneumonolysis on Aug 16, 1945 Continued bed rest and sanatorium care for one year resulted in only slight improvement of the disease in the left lung The cavity remained open Accordingly, a simultaneous extrapleural pneumothorax was performed on the left side on May 1, 1946 (fig 3B) An excellent result has been recorded to date, seven years later, sputum is normal, the patient is working, and there is noticeable resolution of disease in both lungs

CASE 5—A white man, aged 61, had advanced exudative tuberculosis of the right upper lobe with a cavity 3 by 2.5 cm. in the region of the clavicle when he first came under my care on July 8, 1947 Tubercle bacilli were found in the sputum Intrapleural pneumothorax was done, but, since the apex was found widely adherent, treatment was discontinued within a month In the meantime, the cavity had increased in size to 6 by 6 cm A right extrapleural pneumothorax was performed on Sept 5, 1947 The cavity closed shortly thereafter and has remained closed, with the sputum normal since November, 1947 At present (March, 1953), the patient, aged 67, is self supporting and enjoying a normal life, nearly six years after the operation

Fig 4—Reexpansion of extrapleurally collapsed lung A before surgery and B one month after extrapleural collapse

Extrapleural collapse is also a happy solution for young persons who dread thoracoplasty or extensive resection and has also been carried out successfully during pregnancy

Extrapleural collapse is a practical solution to pressing social, economic, and public health problems Because the collapse can be established shortly after the diagnosis is made, it can bring about early effective control of the tuberculous process, early conversion of sputum and an early return to good clinical health, frequently within a matter of months These results are possible because the collapse may be instituted in the presence of a wide variety of unfavorable clinical conditions without waiting for the disease to become stabilized and localized, as is necessary with thoracoplasty or resection, or until pleural adhesions are severed, as in intrapleural pneumothorax Although the disease is not yet cured, the patient

so restored can live a reasonably normal life, mingle freely with others, and become self-supporting Men can go back to their accustomed jobs, women can bear children, and young persons may continue their studies There is no reason why, in the light of the new experiences with this operation, the tuberculous patient need have his life's ambition thwarted or be forced to live a life of semi-invalidism or remain indefinitely in an institution This is one of the truly big achievements of modern medicine—rehabilitation at its best

Since the extrapleural collapse exerts a continuous and profound depressive effect on the bacillus years after all the drugs have lost their value, all that is needed to keep the patient in good health is to maintain the collapse long enough to permit complete healing of the tuberculous lung—empirically, for three to five years The lengthy period of treatment is no particular hardship, or even an important inconvenience, and is a small price to pay for good health Particularly is this true when the collapse is reversible and results in healing with little loss of lung tissue and insignificant disturbance to pulmonary function Extrapleural collapse, therefore, not only solves the immediate pressing social, economic, and public health problems of the tuberculous patient in minimum time and at the least cost but also makes possible long range planning and ultimate eradication of the disease Through a more rapid turnover of patients, it can also alleviate the present shortage of hospital beds The following report is a typical example of the potentialities in this direction

CASE 6—A white married man, aged 36, first came under my observation on May 5, 1949 At that time he had far advanced bilateral pulmonary tuberculosis, involving primarily the upper two thirds of the left lung, with a cavity (2 by 3 cm) at the apex Closely set, flocculent spots were also present in the posterior segment of the upper section of the right lung He had been ill with tuberculosis since March, 1943, and responded to bed rest, only to break down again in 1949 The sputum again contained tubercle bacilli Intrapleural pneumothorax was attempted on the left side shortly after he came under my care but without success, because of an adherent pleura On June 10, 1949, the left lung was successfully collapsed by an extrapleural pneumothorax The cavity promptly closed, and the sputum became normal one month later (July, 1949) It has remained normal ever since and gives negative culture studies

On Dec 11, 1949, six months after surgery, he was discharged from the institution to continue with outpatient extrapleural pneumothorax treatment Shortly thereafter he returned to work At present (March, 1953) he is on the local police force and enjoys good health He is in no way deformed or handicapped in his pulmonary reserve The disease in the right lung, in the meantime, has improved spontaneously and needs no treatment Here was a potentially difficult problem, solved with extrapleural pneumothorax without much hardship or prolonged hospitalization

The importance of always preserving maximal pulmonary function in the treated lung has been increasingly recognized during recent years Neglect of this principle can be of serious consequence to the patient should the need arise for major surgical treatment of the contralateral side, a distinct possibility in about 50% of treated patients

Extrapleural collapse conserves pulmonary function in two ways 1 As a surgical procedure, extrapleural collapse disturbs lung function less than either intra-

pleural pneumothorax, thoracoplasty, or resection, and very much less than resection and thoracoplasty combined in the same patient, a fact substantiated by pulmonary function studies carried out before and after surgical intervention. In fact, the resultant established loss of function after extrapleural collapse is small or nonexistent and is at the expense only of functional residual air.² There is another aspect of the problem of pulmonary function after surgery. Good treatment must always take into consideration the indisputable fact that the tuberculous disease may clear and leave behind healthy lung. Because of the largely reversible character of the modern extrapleural collapse and the tendency for the disease to disappear under collapse, recovery can be achieved with little permanent loss of lung tissue. In contrast, lung lost through thoracoplasty or resection is gone forever.

Contrary to past experiences and commonly held beliefs, modern extrapleural collapse, relieved of empyema and of serious fluid problems, is, in my experience, largely a reversible collapse—more so than intrapleural pneumothorax. This is true even when the patient is given extrapleural collapse therapy for a period of years. The physical factors operating in the extrapleural space always favor long-term reexpansion of the collapsed lung. The following case illustrates this point, as well as many others stressed in this paper.

CASE 7—A white man, aged 26, came under my care on April 27, 1947. Examination revealed far advanced disease involving the right lung: a cavity (4 by 3.5 cm) at the apex, and infiltration extending as far down as the diaphragm, centering chiefly in the third and fourth anterior interspaces (fig. 4A). The left lung was apparently successfully collapsed with intrapleural pneumothorax, which had been maintained since October, 1944. Intrapleural pneumothorax was attempted on the right side to control the disease in this lung but without success. Thoracoplasty or resection was considered too risky. Accordingly, an extrapleural pneumothorax was carried out on Sept. 19, 1947, and an excellent result obtained (fig. 4B). The cavity was closed, the disease in the remainder of the lung controlled, and the sputum rendered normal within a few weeks. The patient now had bilateral collapse: intrapleural collapse on the left side and extrapleural on the right. Within six months he returned to part time work and left my care in August, 1949, in good health.

The intrapleural pneumothorax on the left side was discontinued elsewhere November 1949 and the lung permitted to reexpand. The extrapleural collapse on the right side, however, was maintained. The patient continued to do well. In January, 1952, he started to cough and tubercle bacilli were again found in the sputum. He returned to my care on April 14, 1952. Planigram studies revealed at least one certain cavity in the apex of the reexpanded left lung. The heart and mediastinum were pulled over to the left, and the left diaphragm was more or less fixed and immobile. In addition, there was a fluid cap over the left apex in the area where the lung failed to reexpand. In contrast, the extrapleural collapse of the right lung was virtually the same in extent as shortly after the operation (fig. 5A). The pleural layers were thin, and there was no fluid problem. The right diaphragm was normal in contour and moved freely.

Since the extrapleural collapse had been maintained uninterruptedly for four and one half years, it was decided to reexpand the right lung, at least in part, to restore vital capacity before undertaking surgery on the left side. There was no difficulty whatever in reexpanding the extrapleurally collapsed lung. There was no shifting over of the trachea or mediastinum, no distortion of the diaphragm and no fluid problem during the reexpansion process (fig. 5B). In the planigram

of the reexpanded right apex there were a few calcified spots but no evidence of the original large cavity (fig. 6).

On Sept. 26, 1952, an extrapleural pneumothorax was established successfully on the left side and the simultaneous extrapleural pneumothorax on the right maintained without difficulty. If this patient had been subjected to a thoracoplasty on the right side or lobectomy and concomitant thoracoplasty in October, 1947, instead of a reversible extrapleural collapse, he would have been seriously handicapped in his pulmonary reserve five years later when the disease recurred in the left lung. As it was, he left the institution on Dec. 13, 1952, free of symptoms and with sputum negative by culture. At present, (March, 1953) he is living a reasonably normal life and is self-supporting. All he has to do in the line of treatment is report for refills. He is also continuing with long term combined drug therapy. The prospects for lasting recovery are excellent. The disappearance of the large cavity under collapse in this instance is striking but not at all exceptional.

Fig. 5—Same patient as in figure 4. A four and one-half years later B one month later after reexpansion of the right extrapleurally collapsed lung. Note thinness of the pleural layers after 57 months of continued collapse.

COMPLICATIONS, MORTALITY, AND LATE RESULTS

It is evident from what has been said and from the examples cited, that extrapleural pneumothorax is an exceedingly valuable procedure with a wide field of usefulness. My experience with 129 extrapleural operations in a consecutive series of 121 patients (8 cases of bilateral operations) from December, 1938, to May, 1950, evaluated over an average period of 54 months, has been reported on at some length in a previous communication⁶ and will be brought up to date in detail in a forthcoming paper. Suffice it to say that new experiences with an addi-

7 (a) Gaensler E. A. and Strieder J. W. Pulmonary Function Before and After Extrapleural Pneumothorax: Comparison with Other Forms of Collapse and Resection. *J. Thoracic Surg.* 20: 774-797 (Nov.) 1950. (b) Stead W. W. Physiologic Studies Following Thoracic Surgery. Immediate Effects of Upper Lobectomy Combined with 5-Rib Thoracoplasty. *ibid.* 25: 194-204 (Feb.) 1953.

tional 69 consecutive operations, including poor risk patients with far advanced bilateral disease and deteriorated health, continue to support the published findings

Operative mortality and incidence of important complications will naturally vary with the type of case subjected to operation. The cumulative experience with the entire series of 198 consecutive operations as of March, 1953, is shown in figure 7. To better evaluate this experience, the results are presented as two distinct series of

Fig 6—Same patient as in figures 4 and 5. Note disappearance of large cavity under extrapleural collapse in right side of figure.

operations, those performed during 1938-1946, comprising 64 consecutive operations, and those performed during 1947 through March, 1953, consisting of 134 consecutive operations. Prior to 1946 is the pre-streptomycin era and the period of experimentation, when contraindications had yet to be learned first hand and techniques improved. This is a good record, particularly when one considers the type of patients who were subjected to surgery. 59% had far advanced bilateral disease, and many were not suitable for any other form of effective therapy. Some of the unsuccessful results (seven cases) were due to inability to physically mobilize the lung, and the operation was abandoned without harm to the patient. Other failures can be avoided in future series of cases through more careful attention to detail.

Almost all serious difficulties encountered today are concentrated within the first postoperative week. Once this period is safely past and the collapse well established, extrapleural pneumothorax becomes relatively easy to manage. The fear of late infection of the extrapleural space is not borne out by recent experience. With modern antibacterial drug therapy, serious infection of the extrapleural space is uncommon and the possibility of infection decreases with long-term drug therapy. Fluid, sufficient to require aspiration, may occur from time to time but usually disappears under simple management and is not troublesome. The aim should always be to keep the space dry. The problem of what to do with the extrapleural space when treatment has to be terminated should not be magnified. It is not the serious question one is usually led to believe. In most instances, based on present observations, the lung will reexpand, in others the residual space can be allowed to fill with serum, or safely converted into a selective oleothorax.

These remarks should not be interpreted as implying that a new wave of enthusiasm for use of extrapleural sur-

gery is in order or that other procedures should be pushed aside when plainly indicated or preferred. This would be highly undesirable and is certainly not the purpose of this paper. On the contrary, extrapleural pneumothorax, despite its many advantages, should not be undertaken lightly, for the immediate postoperative management is difficult, time-consuming, and full of pitfalls. Close attention to detail before, during, and long after the operation, and planned use of modern drug therapy are the determining factors in ultimate success. In contrast to thoracoplasty or resection, the extrapleural collapse necessitates constant attention. In fact, extrapleural collapse is a continuous long-term procedure, a one man task or a project for a closely working team. The operation, therefore, should certainly not be used in excess or when indications are lacking. On the other hand, when indications are clear, the gratifying late results fully justify all effort.

SUMMARY AND CONCLUSIONS

There have been rapid and radical changes in the treatment of pulmonary tuberculosis in recent years. Major emphasis today seems to be on drugs and resection surgery, despite the much-needed help available from collapse therapy. Careful study clearly indicates that both resection and collapse are needed, in different types of patients, and that collapse therapy remains an indispensable and important part of good treatment.

Collapse therapy has much to recommend it, the profound depressive effect on the tubercle bacillus is an exceedingly important factor, which is frequently not appreciated. Through closure of terminal bronchioles, collapse deprives the bacillus (a strict aerobe) of vitally needed oxygen, causes it to die or become attenuated, gives the body a chance to build immunity, and results in recovery. In this respect, collapse has one decided advantage over all present antituberculosis drugs. It acts as well against bacilli resistant to the drugs as against those still sensitive, and its effect lasts long after the drugs have lost their value.

Fig 7—Comparative results in extrapleural pneumothorax.

What is surely needed, particularly for the patient with advanced disease, is a reversible form of collapse, similar to intrapleural pneumothorax but without its limitations or potential complications. Extrapleural pneumothorax, expertly performed and managed, admirably fulfills this need.

Since 1946, many important advances have been made in extrapleural collapse technique, which have freed this procedure of its former major complications and objections. Today it offers many advantages. 1 It is effective and well tolerated under a variety of unfavorable clinical

conditions at a time when other forms of surgery are unavailable or inadvisable.² Because it acts quickly, it offers a practical solution to social, economic, and public health problems.³ It disturbs lung function less, and because the collapse is reversible it salvages diseased lung tissue, important considerations in cases of recurring disease.

Seven cases of a consecutive series of 186 are reported to demonstrate the usefulness of extrapleural collapse in acute progressive tuberculosis, uncontrolled hemoptysis,

advanced bilateral fibroulcerative tuberculosis, and in elderly and young patients.

Despite its many advantages, extrapleural collapse should not be undertaken lightly or when indications are lacking. The postoperative management is difficult, exacting, and time consuming. Moreover, the procedure is followed by a protracted refill period. But when indications are clear, the excellent late results fully justify all effort.

IMPENETRABLE CICATRICAL OBLITERATION OF THE THORACIC ESOPHAGUS

TREATMENT BY COMBINED THORACOTOMY AND ENDOSCOPY, WITH REPORT OF TWO CASES

Jorge de Castro Barbosa, M D, R. Martinho da Rocha, M D
and

F. Carneiro da Cunha, M D, Rio de Janeiro, Brazil

In the majority of cases of cicatricial esophageal stricture caused by ingestion of caustics, such as sodium hydroxide (lye), the lumen is safely penetrable endoscopically and dilatations, either peroral or retrograde, through a gastric stoma, can be carried out in an efficient manner, with good anatomic and functional results, when handled by a competent bronchoesophagologist. The combination of peroral and retrograde esophagoscopy with stereofluoroscopy can accomplish much in enabling the endoscopist to penetrate the strictured portion completely and safely, however, in about 3 to 5% of cases more radical measures are needed.¹

Adams and Hoover^{1b} apparently can be credited as the first to have employed thoracotomy in combination with endoscopic treatment of a corrosive stricture of the thoracic part of the esophagus. The obliterated portion was perforated by a metal suction catheter introduced into the distal part of the esophagus through a gastric stoma. Then a thread, which previously had been placed in the proximal portion of the esophagus, together with sodium chloride solution, was aspirated into the distal portion. Shortly thereafter, Barreto,^{1a} working independently, devised more efficient instruments with which to carry out this recanalization. He, in collaboration with de Freitas,² in São Paulo, Brazil, performed the first operations. Later, in 1947, Botelho,³ also in São Paulo, employed Barreto's technique in two cases.

In our series of 40 cases we employed Barreto's^{1a} method in 2 and were successful in both. The technique we employed is as follows. With the patient supine, anesthesia is induced by means of intravenous injection of pentobarbital sodium and an intratracheal tube is placed to enable respiration to be mechanically controlled. Retrograde esophagoscopy is carried out via a gastric stoma constructed at a previous operation. The esophagoscope is advanced through the cardia as far into the esophagus as the obstruction permits. The instrument is anchored to the abdominal wall with adhesive tape. Next, peroral esophagoscopy is carried out, using a scope of wider diameter than the first. This instrument

is carried as far down as possible into the esophagus and is anchored to the patient's mouth with tape.

The patient is then moved to a left lateral position, in preparation for right thoracotomy. Access is through an intercostal space or the bed of a resected rib. Usually the fifth, sixth, or seventh rib is removed to gain access to the midthoracic segment of the esophagus. The patient is then anesthetized with nitrous oxide and oxygen supplemented by curare. The patient's abdomen is placed as near the edge of the operating table as possible, and the sterile drapes are so placed as to leave an ample screened-off space in which the esophagoscopist who handles the retrograde scope can work with ease. The main maneuvers will be carried out through this scope. It is helpful to this endoscopist to see, also extra-esophageally, the progress of his maneuvers. For this purpose a fairly large mirror may be placed above the thoracic operative field in such a way as to permit all movements of the retrograde scope to be reflected and seen by the esophagoscopist from his position at the proximal end of the abdominally-placed scope.

The lung is retracted anteriorly, and the mediastinal pleura is cut longitudinally to expose the desired segment of esophagus. There is no need to crush the phrenic nerve, since the diaphragm need not be immobilized. Depending on the upper level to which the esophagus has to be mobilized, it may be necessary to section, between ligatures, the arch of the azygos vein as it joins the superior vena cava. This was necessary in one of our cases, since the lower end of the upper scope could be felt and the glow from the illuminating bulb could be seen through the esophagus under this vein. The edges of the pleura are dissected anteriorly and posteriorly and retracted by

3 Botelho J. A. de A. in discussion on Barreto^{1a}

means of long, thin threads of silk tagged with forceps. These threads may be used later to suture the mediastinal pleura.

The esophagus is then carefully dissected out of its bed and is mobilized enough to straighten its normal curvature and permit the esophagoscopes to be placed

Fig 1—Instruments used for recanalization of the esophagus with cicatricial atresia from below upward (1) cannula in left hand and proximal end of screwed in stopper in right hand (2) long needle with triple cutting edges at tip threaded with double strand of no. 2 cotton thread (3) smaller esophagoscope used in a retrograde direction through gastric stoma and (4) larger scope with wider lumen used perorally

more nearly in the same axis. One will find at this point that it is possible to advance the scopes even further. Thus, their extremities can be more nearly approximated than was feasible previously. The dissection of the peri-esophageal tissue should be carried out away from the esophagus so as not to damage its muscle. Care should be taken also to preserve the vagus nerves. This dissection is the most delicate phase of the operation, and haste should not be allowed to defeat the purpose of the surgeon to preserve as much as possible of the wall of the esophagus. As the dissection progresses at the site of the involved segment, the number of muscular fibers that can be spared is unexpectedly large. Finally, a fairly muscular walled segment of esophagus is seen, although at first the esophagus appeared to be considerably destroyed.

At this point the esophagoscopist who handles the retrograde scope may begin his maneuvers in collaboration with the surgeon. The instruments are represented in figure 1. A long, thin cannula, supplied with a stopper that is screwed in at the proximal end, is advanced through the lumen of the retrograde scope. It is found that the cannula can be advanced further than the scope into a narrowed portion of lumen that tapers off into the obstructed portion. Then the surgeon, using cotton gloves over his rubber ones to prevent slipping, "dresses" the esophagus over the end of the cannula, making it advance now even further. The ends of the scopes are now found to be apart only half the distance that was seen between them in the roentgenogram taken preoperatively (Compare figure 2B with figure 2C).

The stopper now is removed from the cannula, and a long needle (fig 1), with three cutting edges at the tip, is introduced through the cannula and made to perforate completely the atresic esophageal segment. This is done under the direct guidance of the surgeon, who conducts the needle safely into the wider lumen of the upper scope. Any inadvertent perforation can be sealed immediately by the surgeon. The esophagoscopist whose instrument is above the stricture sees the tip of the needle

as it emerges in his field. Already it is threaded with a double strand of no. 2 cotton thread. The needle is pulled out through the upper scope, and the cotton threads are left in place. The upper ends of the threads are brought out through a nostril and are tied to the lower ends, which make their exit through the gastric stoma. Figure 2B is a roentgenogram taken in the course of the operation, with the two scopes, the cannula, and the needle passing into the lumen of the upper scope.

The dissected segment of esophagus is then encircled by strands of oxidized cellulose gauze, which are left in place. The mediastinal pleura is sutured. The lung is allowed to reinflate, and the thoracic wall is closed except that a catheter is left in the pleural cavity for drainage through the 10th interspace. Continuous underwater sealed suction is employed. The catheter may be removed after 24 or 48 hours and the patient allowed to get up.

The threads are replaced every five days to prevent deterioration. Retrograde dilatations effected via the gastric stoma may be begun 5 to 10 days postoperatively. A "train" of three consecutive rubber Tucker bougies is used at each session. This is continued periodically until metal dilators can be introduced perorally, just as they are employed in treatment of any partial or incomplete esophageal stricture. The patients should be followed closely for the first months and periodically thereafter. During the process of epithelization, small exuberant areas of granulation tissue should be carefully cauterized endoscopically.

REPORT OF CASES

CASE 1—A woman, 23 years old, related that accidentally she had ingested sodium hydroxide 20 years previously. Some form of bougienage had been attempted. When the patient

Fig 2—Roentgenograms taken in case 1. A: preoperative roentgenogram demonstrating complete obliteration of the thoracic portion of the esophagus at a level about 5 cm below the arch of the aorta. B: roentgenogram taken in the course of the operation showing the ends of the two scopes, the tip of the cannula coming out of the lower scope, and the needle already introduced through the cannula and into the lumen of the upper scope. C: anteroposterior roentgenogram showing obliterations of the esophagus from the level of the 7th to level of the 10th thoracic vertebrae. This distance was considerably decreased at operation.

was 3 years of age gastrostomy had been performed for feeding. The gastric stoma had been kept open by permanent use of a thick rubber tube. Through this all nourishment and water was instilled. The patient had to regurgitate swallowed saliva

every hour or so. Two hours was the most that could elapse without regurgitation. From lack of chewing the patient had lost all her teeth, and upper and lower plates had been placed. The woman was undernourished and underweight. Physical examination otherwise gave essentially normal results, and results of routine laboratory examinations were reported to be within normal limits. Roentgenograms of the esophagus after she had swallowed a suspension of barium appeared

Fig 3—Roentgenograms taken in case 2. A, preoperative roentgenogram showing lower end of proximal part of esophagus at a level 5 cm below the aortic arch. Other examinations failed to demonstrate a lumen immediately below the level of the obstruction. B, roentgenogram taken three weeks postoperatively and after two weeks of treatment; the patient had undergone four dilatations and could eat any pasty food and liquids liberally. C, recent roentgenogram showing normal roentgenologic appearance of the esophagus.

as in figure 2A. Similar roentgenograms were made using more fluid contrast mediums. Simultaneous peroral and retrograde esophagoscopy (fig 2C) was carried out. Multiple attempts to penetrate the obstructed esophageal segment failed.

After the patient had reached a good nutritional state, recanalization of the esophagus by means of bidirectional esophagoscopy and thoracotomy combined was carried out with the technique previously described. The thorax was entered through the bed of the resected sixth rib on the right side. The arch of the azygos vein, as it entered the superior vena cava, had to be sectioned between ligatures.

The postoperative course was uneventful. The pleural drainage tube was removed 24 hours postoperatively, and the patient was out of bed 24 hours later. Retrograde dilatations with rubber Tucker bougies were begun five days postoperatively. Use of these was followed by employment of oral metal dilators. The patient was eating everything she wished about three months postoperatively. Six months after the operation roentgenograms disclosed that the upper third of the esophagus was moderately dilated and that the lumen was slightly narrowed at the old site of stenosis. Fourteen months have elapsed now since the operation. Recently, on esophagoscopy, the recanalized segment was seen to be completely epithelized.

CASE 2—A woman 19 years of age, related that she had ingested sodium hydroxide for suicidal purposes almost three years prior to her admission. Bougienage had not been attempted. A gastric stoma had been constructed, through which all food was instilled. The preoperative roentgenogram of the esophagus is represented in figure 3A. Similar roentgenograms were made after the patient had swallowed more fluid contrast mediums. Simultaneous peroral and retrograde esophagoscopy, with insufflation of air, was carried out. Multiple attempts at penetrating the obstructed esophageal segment failed. The patient was undernourished and underweight. Physical examination otherwise gave essentially normal results, as did routine laboratory examinations.

After adequate preoperative preparation, including use of a high caloric, high protein diet and vitamin supplements, the operation described earlier was carried out. The right side of the thorax was entered through the bed of the resected sixth rib. The arch of the azygos vein was left intact. The pleural drainage tube was removed 48 hours postoperatively, and the patient was allowed to get up. The postoperative course was smooth.

Figure 3B is a roentgenogram of the same patient three weeks postoperatively and after two weeks of treatment. Dilatation had been done four times. The proximal portion of the esophagus is still somewhat dilated, and a short part of the lumen is still narrowed. Figure 3C shows that the roentgenologic appearance of the esophagus is normal. Esophagoscopy examinations by two of us (R. M. R. and F. C. C.) revealed that the esophagus was normally epithelized.

This woman was operated on more than a year ago. The gastric stoma closed spontaneously, and the functional result was excellent.

SUMMARY

In two cases of esophageal stricture caused by ingestion of sodium hydroxide (lye) thoracotomy and endoscopy, according to the technique of Barreto, were successfully applied. Esophagoscopes were introduced nearly simultaneously, one through the mouth and the other through a previously made gastric stoma. Thoracotomy was performed and the esophagus exposed. In one case the arch of the azygos vein had to be cut between ligatures. The exterior of the esophagus as it lay in the surgeon's field was made visible by means of a mirror to the endoscopist who handles the retrograde instrument. The upper and lower portions of the esophagus were brought into the same axis, and the distal ends of the two esophagoscopes were approximated as closely as possible. A long cannula was introduced through the retrograde scope and advanced into the narrowed portion of the esophagus below the stricture. The surgeon "dressed" the esophagus over the cannula as far as possible. A long needle, bearing threads, was introduced through the cannula and was thrust through the atresic portion of the esophagus into the upper esophagoscope. The threads, brought out through a nostril and the gastric stoma, were used to carry dilators. The patients were promptly out of bed. Results were excellent.

Rua Debret 23—s 513 (Dr Barbosa)

The General Practitioner.—General practice, no less than the specialties, needs a leavening of exceptionally able men and women.

Prompt and accurate diagnosis is the foundation of successful general practice. The function of the family doctor is to understand the health problems of his patients and to recognize early the nature of their troubles. This is a large order, for his patients are unselected. They come to him with complaints that may be trivial or serious, obvious or obscure, real or imagined, simple or complicated. He must sort them out. In doing so he recognizes those needing immediate treatment from those requiring more observation and study. He decides whether he can treat the patient himself, or if help is necessary. Frequently this latter decision bears little relationship to the seriousness of the condition. He may be able to care for the most serious as well as anyone else. The first diagnosis is often the most important. Making this correctly is not easy, but it steadily is being made easier through the many aids and facilities being placed at the disposal of the family doctor.—W. V. Johnston, M.D., The Changing General Practitioner, *University of Western Ontario Medical Journal*, March, 1953.

CURRENT THERAPY OF GOUT

Charley J Smyth, M D., Denver

Although there is no known cure for gout, the control of the frequency and severity of acute attacks is satisfactory with the measures available. Failure to recognize and manage acute gout leads to much unnecessary suffering and ultimate deformity. Since recent studies point to the hereditary etiology of gout,¹ relatives of patients with active gout who have hyperuricemia should live moderately and avoid obesity, fatigue, exposure to extremes of temperature, excessive trauma to joints, excessive intake of foods high in purines, and all known provocatives of acute gouty arthritis.

A consideration of the treatment of gout must, by the very nature of the disease, be divided into two parts. The now well-known diagram of Dr. Philip Hench (fig. 1) illustrates the typical pattern of the disease and indicates the pretophaceous or first stage, characterized by acute recurrent arthritis with complete remissions, and the tophaceous stage, characterized by chronic arthritis with

Fig. 1—The basic pattern of the course of gout and gouty arthritis (P. S. Hench 1936)

acute exacerbation. During the first stage, the problem of therapy is the management of the acute attacks and measures employed in the intervals to prevent future attacks. In the second stage, the aim of therapy is to relieve the pain of chronic gouty arthritis and to ward off or delay development of the complications of the disease, among which are nephrolithiasis, cardiovascular lesions, and tophi.

TREATMENT OF ACUTE ATTACK

In contrast to most of the other forms of arthritis, the treatment of gout is relatively effective, especially treatment of the acute attacks, results of which are frequently dramatic. In this discussion of current therapy, the traditional measures will be reviewed briefly and the new developments will be emphasized.

Rest—Absolute bed rest, with elevation of the affected part and no weight bearing until the acute pain and tenderness have disappeared, is recommended. The affected part should be temporarily immobilized by means of a

light splint and protected from bedclothes by the use of a cradle.

Drugs—Colchicine. At the first appearance of symptoms of a gouty attack, colchicine, the alkaloid of colchicum, should be taken. Colchicine alone is still the treatment of choice for acute attacks of gout. The recommended dose is 0.5 mg (1/200 grain) in tablet form every hour or two hours until pain is relieved or until diarrhea, nausea, or vomiting occurs. About 10 tablets of colchicine are required in the average attack of gout although the dose may vary from 8 to 16 tablets. Many patients learn by experience the optimum number of tablets to take with each attack, so that alleviation of joint pain may be attained without undesirable gastrointestinal symptoms. The secret of effective therapy is to begin use of colchicine at the very first warning and to use enough to produce some nausea or a loose bowel movement. Use of camphorated opium tincture (paregoric) may be necessary to control the toxic symptoms. The patient should always carry a supply of this drug and start taking the pills at the first appearance of symptoms of a gouty attack. Delay of treatment for a few hours after the onset of acute symptoms may increase the severity and prolong the duration of the acute episode. Response to the drug is often dramatic. Joint pains and swelling begin to subside about 12 hours after the institution of therapy, and, in most instances, pain is completely relieved in from one to two days. Over 95% of acute attacks are materially benefited by a single course of colchicine. Should no benefit occur, a second course of colchicine should be given after an interval of three days; repetition of a course sooner may precipitate gastrointestinal symptoms. The mechanism of action of colchicine is unknown. It does not act through the mechanism of corticotropin (ACTH). Recent studies using isotopically labeled uric acid suggest that colchicine might decrease the rate of uric acid synthesis.³

Corticotropin and Cortisone. The close relation between gouty arthritis and adrenal cortical function was demonstrated by independent investigators soon after corticotropin⁴ and cortisone⁵ were introduced. Gouty persons excrete subnormal amounts of 17-ketosteroids, usually about one-third of the minimal normal value for adult men.⁶ A second endocrine disturbance characterized by disturbed regulation of the rate of excretion of 11-oxysteroids has recently been demonstrated in patients with clinical gout.^{2b} Further evidence to establish acute gouty arthritis as a true endocrine deficiency state are the pronounced biochemical changes and clinical effects of the administration of corticotropin and cortisone in the gouty person. These hormones are capable both of provoking attacks of acute gouty arthritis in patients with quiescent gout and of causing prompt amelioration of acute gouty arthritis. Typical acute attacks of gout may be precipitated in a large proportion of interval gout patients by the administration and then withdrawal of corticotropin. In most patients the joint symptoms begin within 96 hours. This observation has led to the conclu-

sion that, following the withdrawal of corticotropin there is an 11-oxysteroid lack, which in the normal adult is terminated by a short period of "rebound" 11-oxysteroid excess, in the gouty person this "rebound" appears deficient, and gouty attack occurs during this period of induced relative 11-oxysteroid deficiency

When corticotropin is given to a patient during an acute attack, the symptoms promptly disappear. This rapid control may sometimes result from a single injection of 50 mg. When the hormone is withdrawn, a state of 11-oxysteroid lack is once again induced, and many patients experience a recurrence of their attack within a few days. This tendency of acute gout attacks relieved by corticotropin therapy to return after hormone withdrawal limits the use of this hormone as the sole therapeutic agent for acute gout. Fortunately, colchicine given during or immediately after treatment effectively overcomes this tendency and permits full advantage to be taken of the rapid termination of an acute attack that corticotropin can produce.⁷ In the majority of acute attacks treated by concurrent administration of corticotropin and colchicine, a single 50 mg dose of corticotropin effectively terminates the attack within four hours, in a few patients a second or a third dose at six hour intervals is required. Colchicine administration is begun at the time corticotropin is given. The dose of colchicine is 0.65 mg (1/100 grain) four times daily until the first gastrointestinal symptoms of intolerance occur, then for 24 hours no colchicine is given. Administration of colchicine is resumed in a dose of 0.65 mg three times daily for at least two weeks. Except in a few patients, combined corticotropin and colchicine therapy has proved effective in preventing recurrences. This new regimen is rational and appears to be the most rapid and effective method available for treatment of acute gouty arthritis.

Phenylbutazone Phenylbutazone (Butazolidin) has a pronounced beneficial effect in the treatment of acute gouty arthritis.⁸ It is a new synthetic pyrazol derivative, entirely unrelated to the steroid hormones, having the clinical designation 3,5-dioxo-1,2-diphenyl-4-n-butylpyrazolidine. Phenylbutazone was developed as a solvent of the relatively insoluble aminopyrine, and its first clinical use in various rheumatic diseases was in combination with aminopyrine in a preparation known as Irgapyrin in Europe and Butapyrin in the United States. Since July, 1951, phenylbutazone has been investigated extensively⁹ and found to be as effective as the previously used mixture with aminopyrine. It is available for oral use in tablets containing 100 or 200 mg or for intramuscular administration in a 20% solution. The average effective oral dose is 600 to 800 mg daily in divided amounts, the usual intramuscular dose is 5 ml.

The clinical response is excellent in most acute episodes of gout that have been reported. Among the various rheumatic disorders treated, the results in acute gout are perhaps the most spectacular. With oral administration of this preparation, objective improvement of the affected joints is generally apparent within 24 hours, and, with its parenteral use, there is usually pronounced subjective and objective relief within a few hours. The pathologically elevated plasma urate level generally falls to normal or almost normal within a few days of the start of therapy. This decrease is accompanied by a corresponding increase

in urinary excretion of urates. The results in one patient illustrating these changes are shown in figure 2. Note that in this patient phenylbutazone caused a reduction in the serum uric acid level and a sharp rise in the urinary uric acid level, with a corresponding elevation in the renal clearance of uric acid. The uric acid clearance returned toward normal when sodium bicarbonate was added to phenylbutazone. These observations are contrary to those of Kuzell¹⁰ and Kidd and co-workers.¹¹ In the experience of one observer, gouty patients preferred phenylbutazone to colchicine.¹² Undesirable reactions to phenylbutazone include morbilliform rash, edema, nausea, abdominal discomfort, anemia, vertigo, stomatitis, nervousness, thrombocytopenia, and agranulocytosis. In view of the short-term therapy required to control acute episodes of gout, it is unlikely that serious toxic manifestations will occur, however, the patient should be carefully watched for signs of toxicity.

Fig 2—Effect of administration of phenylbutazone (1200 mg daily in four divided doses) on serum uric acid and urine uric acid levels and renal uric acid clearance in a 35-year-old patient who has recurrent attacks of gout.

Hydrocortisone Beneficial effects from the parenteral and intra-articular injection of hydrocortisone (compound F) have been observed by Hollander.¹⁰ It is not surprising that this adrenocortical steroid is capable of correcting the 11-oxysteroid lack, which is a basic metabolic defect in gouty patients with acute joint symptoms.

Diet—Diet during the acute attack should consist of milk, eggs, cereal, fruits, and vegetables with a low purine content. A large fluid intake is indicated, and all alcoholic beverages should be avoided.

INTERVAL TREATMENT

The management of the patient with gout is not completed when the acute attack is over. This is a chronic disease for which treatment must be continued indefinitely. The aim of treatment in the interval between attacks of acute gout is to avoid or postpone the number and severity of subsequent episodes. It is in the treatment of the gouty subject between acute attacks that encourag-

ing progress is being made, but, unfortunately for both the patient and the physician, such interval management is not ideal, and the clinical cure for chronic gout is still not a reality

In outlining a regimen for gouty patients during the intercritical and chronic gouty arthritis states attention is given to the following factors (1) restriction of activity and avoidance of excessive trauma, (2) abstinence from use of alcohol, (3) the use of one or more of the following drugs colchicine, probenecid (Benemid), phenylbutazone, cortisone, and cinchophen, (4) a diet low in purines and high in fats and carbohydrates, and (5) the care of tophi. Each of these measures deserves further detailed consideration

Activity—The pathogenesis of acute episodes that characterize this disease cannot be traced with certainty, but clinical observations for many centuries have established certain events as factors in precipitating an acute flare-up of quiescent gout. One of these factors is acute trauma to a joint. Unusual physical activity, such as excessive walking, will also precipitate a bout. A patient may be suddenly incapacitated by acute gout during his usual occupation and may attempt to place the blame on minor injury. To avoid unjust claims for an industrially connected or aggravated event, it is important to point out that dietary indiscretions, alcoholic overindulgences, minor surgical operations, the use of certain drugs (liver abstract, mercurial diuretics, or sulfathiazole), and exposure to cold and dampness are also provocative factors.

Alcohol—Despite abstinence from the use of alcoholic beverages many patients continue to have repeated bouts of joint pain. Although evidence of the therapeutic value of such abstinence is inconclusive, it is preferable that use of alcohol be avoided, except in small amounts, and these should be permitted only if the patient insists on this privilege.

Drugs—**Colchicine** There is a conviction among some physicians that colchicine has a preeminent place in the prophylaxis of acute gout in cases in which there are recurrences of acute severe attacks. In such cases the patient regularly takes 0.5 to 1 mg. every night. In 23 cases reported by Gutman¹¹ this daily ingestion of colchicine together with dietary restriction of proteins and purines has proved to be by far the most effective method of minimizing the frequency and intensity of acute gouty attacks. In some instances it has made the difference between virtual incapacitation and relatively normal activity. These patients are also taught to take larger abortive doses of colchicine on the first intimation of an attack, such as pain, stiffness, or other indisposition.

Probenecid Probenecid is a relatively nontoxic urate diuretic, which is effective in the treatment of the interval and chronic gouty arthritis stages of this disease. It was first introduced into clinical medicine as an adjunct to penicillin and *p*-aminosalicylic acid therapy. In patients with chronic gout it effectively lowers the serum urate level by blocking tubular reabsorption of glomerular filtered urates. The clinical application of probenecid was evaluated by Talbott¹² in more than 30 patients with chronic gout. With its use, blood uric acid levels promptly fell to normal and remained there even after prolonged therapy. The urinary uric acid excretion was increased

20 to 30%. Gutman¹¹ and Yu¹³ reported the results of the use of this uricosuric agent in 14 patients and concluded that probenecid was the most satisfactory urate diuretic for protracted administration, no new tophi developed in any of their patients with chronic tophaceous gout, and in several of their patients who had received protracted therapy there was disappearance or decrease in size of tophi together with reduction in swelling of chronically enlarged joints. Administration of 0.5 gm. daily for one week followed by 1 gm. daily in divided doses is recommended. This latter dose can be given for an indefinite period. Acute attacks of gout may develop soon after the onset of therapy, but their incidence diminishes with continued therapy. If an acute attack of gout occurs during therapy, probenecid should be continued and full doses of colchicine should be administered. When aspirin is given simultaneously with probenecid, the action of the latter drug in lowering the serum urate level is completely annulled.¹⁴ Therefore, salicylates should not be given in conjunction with probenecid, either for an analgesic or a diuretic effect. Thus far, there have been no indications of aggravated renal damage owing to the increased excretory urate load on the kidneys produced by this agent. To summarize, probenecid is of value in the long-term control of chronic gouty arthritis, it is of no value in acute attacks of gout. Although experience is limited, it appears that mobilization of gouty tophi by the protracted use of this uricosuric agent may be accomplished.

Phenylbutazone Reports of the clinical evaluation of phenylbutazone in the second stage of gout (chronic gouty arthritis and superimposed attacks of acute gout) are few. Kuzell¹⁵ has treated 58 patients with chronic gout with phenylbutazone and compared the results with those in 41 other patients with chronic gout who received Butapyrin. In this comparative study there was no significant difference in the therapeutic response to Butapyrin and phenylbutazone. In 36 patients with chronic gouty arthritis maintenance therapy was employed. Twenty-seven of the 36 had decreased frequency of acute attacks as well as amelioration of the chronic gouty arthritis. Acute exacerbations in patients with chronic gout responded to increased amounts of the drug. The maintenance dose varied from 200 to 800 mg. daily. In this study most gout patients preferred phenylbutazone to colchicine. Steinbrocker and his associates¹⁶ administered phenylbutazone to 52 patients with painful muscular disorders, among these was one patient with chronic gout who was treated for three and one-half months, with great improvement. This patient considered his condition better during that time than when he had used cortisone. These early results are promising. Additional clinical trials are indicated to determine the incidence and severity of toxic effects. The influence of phenylbutazone on uric acid metabolism warrants extensive investigation.

Cinchophen The use of cinchophen in chronic gout is a controversial subject. Because of its toxicity and because the same results can be obtained without the risk of complications by the use of salicylates and probenecid, cinchophen should not be used in this disease.

Dietary Restrictions—It is widely accepted that the diet of the patient with chronic gout should be low in

purine-rich foods to relieve the already overburdened mechanism for the disposition of purines. There is no altogether convincing evidence to prove that adherence to a rigorous purine-free diet reduces the frequency of acute attacks or prevents chronic arthritis or the complications of gout. It is well established, however, that less uric acid is excreted in the urine when a regimen of reduced purine intake is followed. It appears unreasonable, therefore, to introduce unnecessary amounts of purines. A reasonably low purine intake can be obtained by eliminating sweetbreads, anchovies, sardines, liver, kidneys, and meat extracts, a restriction that offers no hardship to most patients. Further confusion with respect to the value of dietary restrictions has resulted from the recent demonstration by several groups of investigators¹⁵ using isotopically labeled carbon and glycine that synthesis of uric acid occurs regularly from the simplest nitrogen and carbon compounds. It is clear from this discovery that all proteins, fats, and carbohydrates must be regarded as potential precursors of uric acid and that complete control of uric acid formation by dietary regulation is impossible. Although the usefulness of dietary restriction is still not established, it seems advisable in patients with chronic gout to limit the purine as well as the protein intake.

Treatment of Tophi—If tophi of the hands or feet become large or ulcerate, excision with thorough débridement results in prompt healing and obviates the danger of infection and possible amputation. If the report of Yu and Gutman¹³ can be confirmed, the prolonged administration of probenecid would be useful in reducing the size of old, established tophi and removing the urates that are deposited in involved joints and bursae.

SUMMARY

In recent years, real progress has been made in the development of new methods for the management of gout. A more rational approach to therapy, based on knowledge of the basic mechanisms of the metabolic defect in gout obtained from new methods of investigation, especially the employment of isotopes, has developed. The establishment of gout as an endocrine disease occurring in persons with hereditary susceptibility permits the physician to promptly recognize and treat the early stages of gout. Within the past few years, several new drugs have been introduced that produce profound biochemical changes and definitely influence the clinical course of this disease. The hormones corticotropin (ACTH), cortisone, and hydrocortisone (compound F) have a dramatic effect on the acute episodes of gout and provide new tools for further investigation of the pathogenesis of this illness. The concomitant use of corticotropin and colchicine, as recommended by Wolfson, offers a promising new approach to the control of acute episodes of gouty arthritis. The prolonged administration of the urate diuretic drug probenecid (Benemid) effectively removes the urates that are deposited in the joints and bursae, and recent studies in a limited number of cases have shown that its long-term use reduces the size of established tophi. The spectacular results already reported indicate that phenylbutazone (Butazolidin) may be a useful drug in both the acute and chronic stages of this disease. If the occasional undesirable effects prove not to be serious hazards, this new pyrazole derivative will be a welcome addition to the growing list of drugs of value in this crippling disease.

TRYPSIN INHALATIONS IN RESPIRATORY CONDITIONS WITH THICK SPUTUM

Leon Unger, M D

and

Albert Howard Unger, M D, Chicago

For many years one of us (L U) has been interested in securing an ideal preparation to dissolve the thick tenacious material that impedes the respiration of patients with bronchial asthma and other respiratory conditions. In 1937, in collaboration with Albert H Andrews, assistant clinical professor of bronchoesophagology at the University of Illinois Medical School, an aerosol was made of an enzyme derived from the fruit of the plant *Carica papaya* and was tested in animals and on 10 patients. The investigation, which was unpublished, was discontinued because of severe local reactions including bleeding and marked hoarseness. Recently, our interests were drawn to trypsin, a natural body enzyme that digests necrotic tissue without producing adverse action on living tissue. The effects of this enzyme on 73 patients are herewith reported.

PHARMACOLOGY

The highly purified crystalline trypsin used in this study and available as Tryptar is derived from mammalian pancreas and is found normally in the intestinal

tract. This enzyme has a broad spectrum of vigorous proteolytic action on protein, denatured protein, true peptones, respiratory and intestinal mucin, fibrin, and protein split products. The final degradation products of tryptic digestion are small polypeptides and some amino acids. Crystalline trypsin does not digest living tissue, since both serum and viable cells contain specific trypsin inhibitors as well as nonspecific inhibitory substances, which act as protective mechanisms against proteolytic digestion. This selectivity of digestion plus the absence

Roth, Assistant Medical Director, the Armour Laboratories, assisted in the program of this study. La Verne LaMarche and Tybee Sue Meyers, technologists, gave many of the inhalations. Mr Robert R. Lee, technician in anesthesia, Wesley Memorial Hospital, gave assistance.

of antigenicity or sensitivity appealed to us, as well as to a number of other workers, as a preparation well worth investigation

PREVIOUS CLINICAL WORK

The first clinical paper presented on crystalline trypsin pertained to the significant value of its intrapleural administration in the sterilization of the disease process and reexpansion of the lung in selected cases of tuberculous and nontuberculous fibrinopurulent empyema.¹ This was followed shortly by articles² on the use of the enzyme in the local therapy of many suppurative and necrotic lesions, such as grossly contaminated amputation stumps, subcutaneous hematomas, chronic osteomyelitis, diabetic gangrene, slough wounds after failure of skin grafts, and decubitus and varicose ulcers. The use of trypsin by inhalation was commented on by one of us (L. U.),³ Roettig and co-workers,⁴ and Limber and co-workers⁵, the latter reported on studies undertaken in patients with active pulmonary tuberculosis who had tenacious sputum as well as in patients who had other conditions in which the high viscosity of the sputum presented a problem. Limber and co-workers⁵ stated that "In vitro 50,000 units of crystalline trypsin produces a dramatically rapid liquefaction in 25 cc samples of thick sputum obtained from patients with active pulmonary tuberculosis." This lysis was reflected by a decline in the measured sputum viscosity. Rabbits were also given trypsin in aerosol form and showed no marked histological deviation from the normal appearance of the tracheobronchial tree and lung parenchyma. These authors concluded that "Aerosol trypsin is relatively nontoxic, harmless to respiratory tissue, and does not impede ciliary action."

SELECTION OF CASES

The vigorous fibrinolytic properties of crystalline trypsin, plus its ability to cause digestion of respiratory mucin, indicated that the preparation should be of value in the treatment of disorders of the bronchial tree associated with hypersecretion and accumulation of fibrinomucinous sputum. Thus, this study, conducted both in the hospital and in the office, included a varied group of respiratory conditions, such as bronchial asthma and emphysema that had not responded to usual therapy, bronchiectasis,

infectious bronchitis and pneumonitis, acute atelectasis, and recently some work with bulbar poliomyelitis

ADMINISTRATION

Earlier in this study 125,000 to 250,000 units of aerosol trypsin was given routinely to all patients, however, because of frequent hoarseness at that time the initial dose is now 75,000 units dissolved in 1.5 cc of the aerosol trypsin diluent (Sorensen's phosphate buffer solution). The first follow-up dose consists of 100,000 units in 2 cc of the diluent, which is then increased to 125,000 units in 2.5 to 3 cc of the diluent. It has been observed that 50,000 units of trypsin dissolved in each cubic centimeter of the diluent provides a very satisfactory concentration for clinical results. When larger amounts of the enzyme are dissolved in too little diluent, the solution is viscous, it is apt to clog the baffle tubing of the nebulizer, and untoward reactions are more frequent. It should be mentioned that early in the study when hoarseness was not infrequent and when the initial dose was 125,000 units or more, the inhalations were probably given too rapidly and little stress was given to thorough rinsing of the mouth. Inhalations wherever possible are given every day or two, and the total number of administrations per patient has so far ranged from one to eight.

Before the inhalation, the patient is usually given 0.25 cc of a 1:1000 solution of epinephrine combined with 0.75 cc of a soluble antihistamine, such as methapyriline (Histadyl) hydrochloride or diphenhydramine (Benadryl) hydrochloride. These drugs dilate the bronchi and bronchioles, and the antihistamine possibly reduces the incidence of hoarseness and dyspnea. The "mask" method of aerosolization is used, which consists of rubber tubing extending from the oxygen tank to a DeVilbiss no. 40 glass nebulizer or a Vaponefrin plastic nebulizer. The latter nebulizer is attached directly to a BLB mask rebreathing bag apparatus, whereas when using the DeVilbiss nebulizer a "threaded connector" * covered with a short section of rubber Penrose tubing must be attached to the mask rebreathing bag apparatus. After placing aerosol trypsin in the nebulizer, the mask is strapped to the face with crevices being closed with cotton or moist gauze to prevent escape of the enzyme, and moist gauze dressings are placed over the patient's eyes. Usually 15 to 20 minutes are required to nebulize 2.5 cc of trypsin solution when using a flow rate of 4 to 6 liters of oxygen per minute.

In addition to the "mask" method, nebulizations may be given by the direct method using oxygen, the direct method using compressed air, or the direct method using a hand pump. The direct method using oxygen consists of rubber tubing extending from the oxygen tank to a glass Y-tube. The latter is connected by rubber tubing to a DeVilbiss or a Vaponefrin nebulizer, which is held between the teeth. During inspiration the open end of the Y-tube is occluded with the thumb to direct the flow of oxygen through the nebulizer. The direct method using compressed air consists of rubber tubing from the compressed air source to a glass Y-tube. The latter is connected by rubber tubing to a DeVilbiss or a Vaponefrin nebulizer. The direct method using a hand pump consists of a DeVilbiss hand pump, rubber tubing, and a nebulizer (combination 740). The hand pump may be operated by either the patient or another person.

In order to avoid nasal or oral irritation, patients are advised to inhale through the mouth and exhale through the nose during administration of the aerosol and, immediately after discontinuation of the treatment, to blow the nose and wash out the mouth with water and then to drink a glass of water

RESULTS

As can be observed in the tables, aerosol trypsin constitutes an ideal agent for removing from the respiratory tract thick sputum that the patient is unable to expel. Generally speaking, the thicker the sputum and the greater the volume the better are the results. In order to determine the efficacy of the inhalations, sputum was collected in a basin after some of the treatments and examined for color, mucoid plugs, and viscosity. It was noted that 14 of 19 patients with bronchiectasis with or without bronchial asthma obtained excellent relief after receiving two to eight inhalations with total dosage varying from 200,000 units to 2 million units. One patient who received 2 million units and one patient who received 1,750,000 units were each given four inhalations followed later by another series of four inhalations. Four of the five patients with acute atelectasis had excellent results from aerosol trypsin inhalations, it is unfortunate that in the first case aspiration through the bronchoscope was performed before the enzyme was available. Nevertheless, the many rales that were present after bronchoscopy disappeared after aerosol trypsin inhalations. In the last case the patient was in a terminal status before inhalations were begun, and even though he died 14 hours after the first inhalation he coughed up much thick sputum. In the other three patients the atelectatic areas vanished after the inhalations. Despite this small number of patients, it would appear that in acute and in impending atelectasis aerosol trypsin could well be an excellent substitute for bronchoscopic aspirations. It has been noted that in many of our patients inhalations of the enzyme produce a slight tickling sensation of the posterior pharyngeal wall, which stimulates coughing, this occurs even in surgical patients who have refused to cough or in whom coughing has been ineffectual due to postoperative pain. Seven of 11 patients with bronchial asthma plus infectious bronchitis or pneumonitis obtained excellent results. The infectious elements were quickly controlled, although the bronchial asthma did not respond as well. In paroxysmal bronchial asthma, aerosol trypsin produced excellent results in four patients (one was a repeat treatment on second admission), good results in one, and no results in two. These comparatively good results contrast rather sharply with the mediocre effects obtained with the use of the enzyme in chronic bronchial asthma associated with more or less emphysema. In this latter group of patients excellent relief was secured in only 5 of 31 patients, with good benefit in 9 patients, and no benefit in 17.

REPORT OF CASES

CASE 1—A white woman, aged 45, with bronchiectasis was admitted to the hospital May 17, 1952, because of increased dyspnea for the past month, fever, and bubbling rales. Bronchograms revealed a mild cylindrical and sacular bronchiectasis of the lower lobes of both lungs and of the lingular division of the upper lobe of the left lung. A consultant surgeon advised against lobectomy. On the fifth hospital day 250,000 units of aerosol trypsin was given. Within three hours

the patient filled an emesis basin with tenacious sputum. The next morning the temperature, which had been up to 101.8 F, was normal for the first time since admission, and remained normal until her discharge six days later. The daily sputum volume while she was in the hospital decreased from 100 cc down to 15 to 20 cc, and rales greatly diminished. She received three aerosol inhalations totaling 750,000 units. In October, 1952, wheezing and increased expectoration were brought on by a cold. Excellent results were again obtained with a series of three inhalations, each consisting of 125,000 units of aerosol trypsin. This patient will probably need aerosol therapy from time to time.

CASE 2—A white man, aged 49, had hypostatic pneumonia with atelectasis on the third day following a gastric resection. His morning oral temperature was 103 F, he was slightly cyanotic, and breath sounds were absent in the lower lobe of the left lung, because of pain he would not cough. Roentgenograms confirmed the diagnosis of atelectasis. A single dose consisting of 500,000 units of aerosol trypsin in 7 cc of Sorensen's phosphate buffer solution (trypsin diluent) was given by aerosol during a period of 40 minutes. The patient coughed during the entire inhalation and within 30 minutes following termination of treatment filled an emesis basin with thick yellow green mucus, and mucous plugs. His color improved remarkably, and a roentgenogram taken seven hours later with a portable x ray machine revealed no evidence of atelectasis, although some density was still present.

TABLE 1—Results Obtained with Aerosol Trypsin in Seventy-Three Cases

Diagnosis	No. of Cases	Results		
		Excellent	Good	None
Bronchiectasis with or without bronchial asthma	19	14	4	1
Acute atelectasis	5	4	1	
Bronchial asthma with infectious bronchitis or pneumonitis	11	7	4

Chronic bronchial asthma with emphysema	31	5	9	17
Total	73	34	19	20
Addendum				
Bulbar poliomyelitis with tracheotomy	8	5	3	

CASE 3—A white man, aged 56, had pulmonary disease for five years and was admitted to the hospital acutely ill, with marked dyspnea, orthopnea, and wheezing. Roentgenograms revealed marked bilateral infiltration with a suggestion of bronchiectasis, emphysema, and some fluid at the bases of both lungs. Following the administration of 0.5 cc of 1:1,000 epinephrine, the patient was given 125,000 units of aerosol trypsin. Within one hour he coughed up 150 cc of thick tenacious sputum containing many plugs. That night he slept well for the first time in three weeks, without dyspnea or orthopnea. On the following day, after the use of 250,000 units, the patient expectorated twice as much sputum. Transient hoarseness developed three hours after the aerosol was given. Roentgenograms taken three days later revealed dramatic clearing of the pulmonary densities. On this day two inhalations, each consisting of 250,000 units, were followed with expectoration of 250 cc of sputum. The clinical picture continued to improve, the vital capacity increased from 33% to 90% of normal, and he was able to walk up and down stairs without discomfort. The patient was discharged on the 10th hospital day and on readmission for a check up three months later was in good health. This patient also received injections of penicillin, and credit for his remarkable improvement must be shared by both procedures.

CASE 4—A white woman, aged 44, was admitted to the hospital with a diagnosis of paroxysmal bronchial asthma. She received four inhalations of 250,000 units each. After each administration several mucous plugs were coughed up, and the clinical picture improved daily. After the first inhalation a transient rash appeared about the margins of the mouth. Three months later when readmitted to the hospital, similar inhalations gave similar excellent results.

CASE 5—A white housewife, aged 64, was admitted to the hospital with chronic asthma, emphysema, and mild diabetes. She received three inhalations of aerosol trypsin (125,000, 75,000, and 100,000 units) over a period of seven days. There was no appreciable increase in sputum, and wheezing continued.

COMMENT

On the basis of the aforementioned data it is obvious that aerosol trypsin gives best results in patients with thick or copious sputum such as occurs in bronchiectasis or in acute atelectasis. Favorable results are also obtained in paroxysmal bronchial asthma and in patients with both bronchial asthma and pulmonary infections. The poorest results are in those with chronic bronchial asthma associated with emphysema. The amount of sputum induced by aerosol trypsin immediately following inhalations varied from a few cubic centimeters to as much as three emesis basins full of purulent material. As a corollary to the amount of expectoration, the chest findings are proportionately changed. In those patients who have profuse expectoration and bubbling rales, the dyspnea, wheezing, and cough usually decrease and rales disappear or are lessened. Aerosol trypsin inhalations do not constitute a cure, however, they provide temporary relief to many patients with respiratory disease. When sputum again accumulates, aerosol trypsin should be readministered, good results can again be expected.

TABLE 2—*Untoward Reactions Observed with 270 Trypsin Aerosol Inhalations in 73 Patients*

Transient hoarseness	14
Increased asthma	4
Rash about lips	1
Nausea and vomiting	1
Total reactions	20

Transient hoarseness occurred in 14 of 73 patients in whom a total of 270 inhalations were given (table 2), however, as studies proceeded, it was observed that the degree and incidence of hoarseness were considerably diminished by administering inhalations more slowly, by giving smaller initial doses, and by having patients wash out their mouths with water after each inhalation. Of the 14 patients with transient hoarseness, the reaction was severe in 3 but disappeared in a few days, some patients received additional inhalations with no recurrence of hoarseness.

In the latter part of our study each patient received 0.25 cc of 1:1000 epinephrine, and 0.75 to 1.0 cc of an antihistaminic preparation such as methapyrilene hydrochloride or diphenhydramine hydrochloride 15 to 30 minutes prior to aerosolization. The administration of these drugs probably increases the caliber of the bronchial tree to such a degree that aerosol trypsin reaches a larger area. Furthermore, it is possible that these drugs may have contributed to the lower incidence of hoarseness noted in the latter part of our study.

A temporary skin rash was observed around the margins of the lips in one patient, increased difficulty in

breathing in four patients, and caused nausea and vomiting in one patient when the aerosol was given. The latter patient expectorated large amounts of sputum and obtained good therapeutic results. There was no evidence of sensitivity in any of the patients, not even in those patients in whom therapy was resumed after having been discontinued for long intervals. One of the medical technologists has some burning of the eyes and rawness of the throat when administering the aerosol, and another technologist, who is allergic, has transient increase in coughing and rhinitis when not wearing a gauze mask.

SUMMARY AND CONCLUSIONS

Seventy-three patients with respiratory conditions with or without thick, viscous sputum were treated with a naturally occurring body enzyme—trypsin—in aerosol form. This enzyme, which is nontoxic and does not affect living tissue, lessens the viscosity of the sputum.

From the data obtained we believe the following conclusions may be drawn: 1. Inhalations of aerosol trypsin are extremely effective in ridding the upper part of the respiratory tract of thick sputum that the patient is unable to expectorate. 2. Excellent results were obtained in most patients with bronchiectasis, acute atelectasis, and bronchial asthma complicated with bronchitis or pneumonitis, good results were secured in paroxysmal bronchial asthma. We strongly recommend aerosol trypsin in these cases. The majority of patients with chronic bronchial asthma and emphysema received little or no relief, although a few were benefited. 3. Aerosol trypsin is a safe preparation to administer, and, when given in the manner used in the latter part of the present study, hoarseness, the only troublesome side-effect, became much less frequent.

ADDENDUM

With the loss of natural humidifying processes in the patient who has a tracheotomy, especially when he is in a respirator because of respiratory failure from acute bulbar poliomyelitis, dried respiratory secretions present one of the most difficult hurdles in management. The commonest respiratory disease found in these patients at autopsy is probably atelectasis, due partially to the passive activity of the iron lung and partially to mucoid plugs that occlude the bronchi and larger bronchioles. The poliomyelitis patients mentioned in table 1 are but a small number of those who received trypsin inhalations at several Chicago hospitals during the 1952 epidemic. Recently, several articles have appeared on the use of trypsin in selected poliomyelitis patients.⁶

The use of aerosol trypsin in the patient who had undergone a tracheotomy was of necessity different from the aforementioned technique. The DeVilbiss no. 40 nebulizer was used, and a small length of rubber tubing was attached to the mouth of the nebulizer, with the other end of the rubber tubing resting in the cannula of the tracheotomy tube. A flow of 6 or 7 liters per minute of oxygen was passed through the nebulizer. The patient was placed alternately on each side and on his back. One half to one hour after completion of the inhalation, the patient was placed in extreme Trendelenburg position, and tracheobronchial aspiration was done with a long suction catheter. During the aspiration, the patient was again turned from side to side to help postural drainage.

6. Steigman, A. J. and Scott, C. H. Trypsin in Poliomyelitis Patients with Tracheotomy. *J. A. M. A.* 150:1403-1404 (Dec. 6) 1952. Peck, M. E. and Levin, S. Atelectasis: Physiopathology and Treatment. Special Reference to its Occurrence in Bulbar Poliomyelitis and to a Suggested Therapeutic Aid by the Intrabronchial Administration of Trypsin. *J. Thoracic Surg.* 24:619-636 (Dec.) 1952. Enzymes and Tracheotomy annotations. *Lancet* 1:233 (Jan. 31) 1953.

CASE 6—A white woman, aged 28, was admitted to the hospital with acute bulbar poliomyelitis. She had undergone tracheotomy and had been in a respirator for 36 hours prior to trypsin inhalations. It was believed that the patient's airway was clear, since only a small amount of mucus could be suctioned through the trachea, however, during this period the patient became progressively more cyanotic, despite the fact that the respirator was in good working order. The patient was unresponsive immediately prior to and during the early part of the inhalation of 250,000 units of trypsin. The enzyme was nebulized directly into the trachea, and during the

administration she was rotated from side to side. One half hour after completion of treatment, the patient was placed in extreme Trendelenburg position and tracheobronchial aspiration was necessary for the next 70 minutes to remove all the mucus that drained into the trachea. The patient was greatly improved.

Aerosol trypsin may become an important procedure in the management of patients who undergo tracheotomies, especially in those with acute bulbar poliomyelitis.

HYPERVENTILATION AND PSEUDOHYPOGLYCEMIC REACTIONS IN DIABETES MELLITUS

Marc J Musser, M D , Thomas H Lorenz, M D

and

Gerald J Derus, M D , Madison, Wis

Reactions that usually are regarded as hypoglycemic in origin quite frequently complicate the treatment of diabetic patients receiving insulin. When these are relieved by simple alteration in diet or insulin dosage, they do not become a matter of undue concern to either the patient or the physician. On the other hand, when they fail to be controlled satisfactorily by such measures, their management presents a perplexing problem. The lack of correlation that may occur between the clinical manifestations of reactions and the blood glucose level² adds further to the confusion.

Reactions of the latter type—where characteristic symptoms occur in the presence of normoglycemia or hyperglycemia—have been referred to as pseudohypoglycemic reactions.² The mechanism for these is not completely understood. Most investigators have sought to relate them to the physiology of diabetes mellitus and have postulated that they are due to some disturbance in the availability, transportation, or utilization of carbohydrate by the brain.³ Others, however, have presented evidence that reactions of this type may be caused by factors entirely unrelated to diabetes. In 1948 Fabrykant and Pacella reported on seven labile diabetic patients who had frequent pseudohypoglycemic reactions.² Because six of these subjects had borderline or abnormal electroencephalograms and three improved with anticonvulsant therapy, it was proposed that electrocerebral dysfunction was the basis for their reactions. (No explanation was offered for those of the seventh patient, who had a normal electroencephalogram and was unimproved by six weeks of Mesantoin [3-methyl-5,5-phenylethyl hydantoin] therapy.)

In the course of a study of the emotional status of a group of diabetic patients, the frequency with which symptoms of hypoglycemic reactions appeared in those who had excessive anxiety was striking. Also, an intimate temporal relationship between such symptoms and anxiety-provoking situations was apparent. When it was established that many of these reactions were of the pseudohypoglycemic type and none of the patients had significant electroencephalographic abnormalities, it seemed possible that some circumstance related to anxiety might be responsible for them. It is interesting that in

1936 Daniels⁴ pointed out the similarity between the clinical manifestations of hyperinsulinism and "anxiety neurosis" and subsequently Fabrykant and Pacella⁵ commented upon the resemblance of spontaneous hypoglycemia and "hysteria." No efforts were made to elucidate these clinical relationships, however.

The precipitation of hypoglycemia (as well as hyperglycemia) by emotional stress in diabetic patients has been reported by several investigators.⁶ Although such observations may pertain to reactions associated with hypoglycemia, they do not provide evidence regarding the possible relevance of emotions to reactions unaccompanied by abnormal depression of blood glucose.

Anxiety has been noted to be a common and prominent component of the personality patterns of diabetic patients.⁷ It is well recognized that anxiety is accompanied by physical manifestations that vary widely in their nature and severity. One of these is hyperventilation, which may produce alarming and occasionally incapacitating symptoms. The frequency with which overbreathing occurs in various types of emotional disorders has led to the recognition of the "hyperventilation syndrome" as a clinical entity.⁸ As shown in table 1, a comparison of the usual symptoms resulting from hyperventilation with those accompanying mild to moderate hypoglycemia shows a remarkable degree of similarity. In view of the foregoing considerations, the possibility that emotionally induced hyperventilation in certain diabetic patients might be the mechanism responsible for their nonhypoglycemic reactions seemed worthy of investigation.

METHODS AND MATERIALS

All diabetic patients admitted to the medical service of the university hospitals during a 12 month period who were between the ages of 21 and 50 years and who complained of frequent "insulin reactions" were studied. For the purpose of this investigation, however, those whose reactions always were accompanied by hypoglycemia and those who had proved cerebral dysrhythmia (three

Dr Derus is now on the Staff of St. Mary's Hospital From Department of Medicine University of Wisconsin Medical School and the University Hospitals
Owing to lack of space, the bibliographic references have been omitted from THE JOURNAL and will be included in the authors' reprints

patients) were excluded. Each of the remaining patients had a detailed evaluation by a member of the section of psychosomatic medicine and a social service interview, in addition to the usual medical history, physical examination, and appropriate laboratory studies.

During psychosomatic consultation a comprehensive description of each person's "insulin reactions" was recorded. Later in the interview, with the patient in the sitting position, a hyperventilation test (deep respiration at a rate of approximately 30 per minute for two minutes) was carried out. Throughout the course of this test a careful appraisal was made of objective and subjective symptoms. Finally, the patient's description of his "insulin reactions" and his response to hyperventilation were compared.

While hospitalized, all of the patients in this series had daily fasting blood glucose determinations (Folin-Wu). In many instances, blood glucose levels were obtained several times daily. In addition, an effort was made to

TABLE 1—Comparison of the Usual Symptoms and Signs of Hyperventilation and Hypoglycemia

Hyperventilation	Hypoglycemia
	Mild Manifestations
Dizziness	Dizziness
Apprehension	Apprehension
Weakness and fatigue	Weakness and fatigue
Paresthesias (extremities and face)	Paresthesias (extremities and face)
Palpitation and tachycardia	Palpitation and tachycardia
Sweating (flushing and pallor)	Sweating (pallor)
Disturbed vision (blurring)	Disturbed vision (blurring, diplopia)

Nausea and gagging	Nausea
Shortness of breath	Vomiting
	Severe Manifestations
Panic and hysterical reactions	Apathy and confusion
Muscular hyperirritability (tetany)	Incoordination and ataxia
Syncope	Unconsciousness and convulsions

RESULTS

As presented in table 2, 14 patients (11 men and three women) ranging in age from 28 to 50 years (average, 37 years) were included in this study. With one exception, all were "unstable" diabetics who received insulin in doses of 20 to 70 units daily. Two patients were considered as having "brittle," four severe, and seven moderately severe diabetes mellitus. The remaining subject had mild diabetes that did not require the use of insulin for metabolic control. The duration of diabetes in this group ranged from 3 months to 21 years (average, 9 years). All of the patients had a recent history of frequent (daily to twice monthly) reactions that were attributed to hypoglycemia. During hospitalization 11 of

the group had an aggregate of 60 such reactions. The vast majority of these were considered to be "mild" in that they were manifested only by feelings of weakness, dizziness, sweating, nervousness, and/or hunger. Five reactions occurred that were "severe." These were accompanied by apathy, confusion, unconsciousness, and/or convulsions.

Without exception, each of the patients in the series was found to have personality features and emotional patterns regarded as characteristic of patients with diabetes mellitus and similar to those described by Daniels^{6a} and Hinkle and associates.^{6c} Excessive anxiety was discernible in all of them. Furthermore, their diabetes had become evident clinically in the wake of some particularly stressful life situation, and the subsequent course of the disease seemingly had been influenced by the instability of their emotional reactions.

Correlation of Blood Glucose Levels with Clinical Symptoms of Hypoglycemia—During 27 of the 60 reactions that occurred, blood samples for glucose determination were drawn before therapy was instituted. Blood glucose levels were found to be normal or hyperglycemic (range from 79 mg per 100 cc to 274 mg per 100 cc) in 16 and distinctly hypoglycemic (range from 60 to 40 mg per 100 cc) in 11. Included in the latter group were the five "severe" insulin reactions. In contrast to the foregoing, it was repeatedly demonstrated that blood glucose levels obtained at times when these patients were symptom-free were in the hypoglycemic range or, as was true in one case, were less than the levels associated with their reactions.

Response to Hyperventilation—As shown in table 3, all of the 14 patients were found to be hyper-reactive to hyperventilation, i.e., moderate to severe symptoms occurred with overbreathing for two minutes or less. It is noteworthy that, in four of them, hyperventilation produced such an effect within one minute and, in one instance, this occurred with merely "six deep breaths."

In eight patients (including the five who were markedly sensitive to hyperventilation), overbreathing produced symptoms identical to those of their usual reactions. In the other six their hyperventilation symptomatology was regarded as "similar" to that which characterized their reactions.

Electroencephalograms—The electroencephalographic records of eight of the patients showed low voltage, fast activity, two showed 7 to 9 per second waves in all leads, and four had 10 to 12 per second (alpha) activity. All were interpreted as being within normal limits. In only one instance was there alteration in the electroencephalographic pattern with three minutes of hyperventilation. This occurred in one of the 10 to 12 per second records (case 12) and consisted of slowing of the waves to five per second with a build-up in amplitude to 200 mv (grade 1.5) during the period of overbreathing.

COMMENT

The data presented show that in certain diabetic patients, reactions simulating mild to moderate hypoglycemia occurred as a result of hyperventilation. Thus, hyperventilation as well as cerebral dysrhythmia pro-

vides an explanation for pseudohypoglycemic reactions occurring in diabetes mellitus

Although the electroencephalograms of the patients in this series were consistently within normal limits, it is known that hyperventilation will uncover or potentiate otherwise unrecognized cerebral dysrhythmias.⁹ It also has been reported that the effects of hyperventilation are

presence of anxiety reactions and other psychoneurotic disorders has been emphasized in diabetes mellitus, the occurrence of the hyperventilation syndrome has not. Fortunately, it is a simple matter to test a patient's response to hyperventilation. If typical symptoms of a "reaction" are reproduced by such a test, the physician is afforded a clue that further evaluation of the patient's

* These patients were hyper reactive to one minute of hyperventilation

† This patient was hyper reactive to six deep breaths

augmented in the presence of hypoglycemia.¹⁰ It is entirely possible, therefore, that hyperventilation may have broader ramifications as a mechanism of symptom production in diabetes than merely as an alternative basis for reactions operating in the absence of hypoglycemia and electrocerebral dysfunction

The hyperventilation syndrome and its diversified symptomatology are recognized readily in the psychoneurotic person who has excessive anxiety. While the

emotions and their relationship to the course of his diabetes is in order. Obviously, the successful management of such diabetic patients entails appropriate psychotherapy and correction of their faulty breathing pattern under stress, in addition to the usual medical measures

Unquestionably, most reactions in diabetic patients are hypoglycemic and likewise most are controlled effectively by manipulating the diet and/or insulin dosage. This is not true of all patients suffering from diabetes nor of all

reactions, however. Other causes for similar symptoms exist. When these are present, it is understandable why efforts directed solely at the regulation of carbohydrate metabolism prove ineffective in their control.

SUMMARY AND CONCLUSIONS

Detailed study of 14 diabetic patients who were having frequent "insulin reactions" revealed the following facts: 1. Reactions that were not accompanied by hypoglycemia occurred quite commonly in this group. 2. All of the patients were excessively anxious and also were hyper-reactive to two minutes of hyperventilation. 3. The symptoms incurred by overbreathing reproduced

in these patients their typical symptoms of "insulin reactions."⁴ None of the patients had electroencephalographic evidence of cerebral dysrhythmia (even with hyperventilation).

It is concluded that, when the hyperventilation syndrome occurs in anxious diabetic patients, it can produce symptoms that simulate, and thus are easily misinterpreted as, true insulin reactions. With the recognition of this role of hyperventilation and with institution of appropriate psychotherapy for its correction, the physician can be assured of more successful management in certain of his unstable diabetic patients.

THE PRESENT STATUS OF PLASMA EXPANDERS

Frank W. Hartman, M.D.

and

Vivian G. Behrmann, Ph.D., Detroit

The term "blood substitute," used extensively during World War I and at the beginning of World War II, has been abandoned, since it is agreed that there is no real substitute for blood either in content or in function. In addition, the use of this term is misleading, especially to the public, raising the question as to the necessity for contributions of blood for military and civil defense use or even for friends and relatives. Actually there is no substitute for blood plasma, but certain macromolecular colloidal solutions possessing some of the physical properties of plasma are capable of maintaining the circulating blood volume by virtue of their oncotic pressure, which attracts interstitial fluids into the blood vascular system. The large molecular size prevents their rapid escape into the tissues or through the kidneys until the blood volume has been restored to normal. The term "plasma expander" is now used by the National Research Council and seems the logical name for this group of substances.

The ideal characteristics of these substances have been variously described and defined by many workers. White and Weinstein¹ suggest a plasma expander to be "an agent which will overcome the disparity of the circulatory system that exists in shock, and thus tide a patient over a critical period until such materials as are specifically needed can be given, or the patient can himself manufacture and disseminate enough material to restore his own blood volume."¹ The desirable properties of a plasma expander should include a molecular size large enough for 50% to be retained for 24 hours, an isotonicity, sedimen-

tation rate, osmotic pressure, and viscosity comparable to that of plasma, a molecular structure allowing slow metabolism but not subject to prolonged tissue storage, freedom from pyrogenic, allergic, antigenic, or toxic qualities, and reproducibility and stability.

The earlier experimental and clinical attempts to utilize vegetable colloids having the oncotic properties of plasma, particularly acacia and pectin, proved disappointing chiefly because they produced marked agglutination of the red blood cells *in vitro* as well as sludging *in vivo* and prolonged storage in the tissues instead of metabolic degradation. These deficiencies were probably due to the size, shape, and chemical nature of their molecules. Oncley and his associates² offer tangible evidence to explain this in physical chemical studies of plasma proteins, showing that their molecular weights vary from 69,000 to over a million and that they are ellipsoid in shape, with only fibrinogen which has a maximum length of 500 Å, being in any way comparable to the long chain polysaccharide molecules proposed as plasma expanders. The Council on Pharmacy and Chemistry of the American Medical Association in 1951 reported that so far no blood substitute entirely free from disadvantages has been found. The selection of a foreign material that has the desirable characteristics of human plasma and that could be completely metabolized without producing toxic or allergic reactions would solve the problem.

METHODS OF EVALUATION

In addition to the physical and chemical requirements for plasma expanders, testing in larger animals and man is necessary as regards their effectiveness in hypotensive shock as well as their safety. Their effect in relation to the functional and structural integrity of the vital organs, particularly the lungs, liver, kidneys, and vascular system, must be ascertained.

For determining the relative effectiveness of plasma expanders in the restoration of blood volume after experimental hemorrhage, the methods reported by Bollman, Knutson, and Lundy³ are apparently simple and

accurate Rabbits, dogs, and rats were used. The typical experimental procedure included a hemorrhage of 20 ml per kilogram of rabbit body weight, immediately followed by a blood volume determination using erythrocytes labeled with radioactive phosphorus (P^{32}) and an estimation of the relative erythrocyte-plasma volumes from a hematocrit reading. Immediately after withdrawal of the three minute sample of blood used to determine the volume, the substance used to expand the volume was injected as rapidly as possible into the femoral artery by way of indwelling plastic tubes. Subsequent estimations of blood volume were then made by reverting hematocrit values taken at 15, 30, and 60 minutes as well as at 2, 3, 6, and 24 hour intervals to the original blood volume determination. Using this procedure, these workers show the relative effectiveness of several macromolecular substances in the maintenance of blood volume immediately after replacement and up to 24 hours.

Data⁴ relating to the distribution and storage of expanders may be obtained in the case of dextran and polyvinylpyrrolidone when these substances are labeled with radioactive carbon (C^{14}). With other macromolecules as well as with dextran and polyvinylpyrrolidone histological studies are indicated. In prolonged retention they are readily recognized through the presence of the phagocytized material in parenchymal cells, endothelial cells, and especially the reticuloendothelial cells.⁵ In addition material escaping into the tissues may produce a foreign body reaction or a granulomatous inflammatory reaction. The use of specific stains for these macromolecules affords additional evidence of their presence.

Experimental methods designed for evaluating the efficacy of a plasma extender in combating marked hypotension usually employ the hemorrhage and replacement technique. The method in which a single massive hemorrhage is continued until respiratory arrest or cessation of bleeding occurs and then the test substitute is employed for immediate replacement has been useful but is scarcely crucial enough for evaluation of hyperoncotic expanders currently being used. Therefore, the animal survival method used by Govier and his associates was our selection. It was employed with the advantage of coincident continuous blood pressure tracings.

Dogs, under light thiopental (Pentothal) anesthesia, were prepared for blood pressure recording from the right femoral artery and for bleeding from the left femoral artery. Intravenous infusions were made through the right femoral vein. The animals were subjected to three massive hemorrhages at 30 minute intervals, which would be fatal if untreated. Accordingly, in the first stage enough blood was removed to cause respiratory arrest, in the second 70% of the amount in the first stage was removed, and in the third 48% of the amount in the first. There was immediate rapid replacement after each bleeding with an equivalent volume of test substance. Blood for hematocrit estimation was drawn during each hemorrhage and 15 minutes after the end of the third infusion. The cannulated vessels were tied off, and the wounds were disinfected and sutured. The animals were considered to have survived the experiments if they lived for 24 hours after the end of the third replacement. As

data with this method accumulated, we were impressed with the marked individual variation in the experimental animals. It seemed expedient, therefore, to include another end point for the first hemorrhage as well as that laid down by Govier. In some animals, cessation of blood flow occurred prior to respiratory arrest and so was taken as an end point. In this series, the first massive hemorrhage equaled from 4 to 5% of the body weight. Consequently, 75 to 80% of the blood volume was replaced with plasma expander. At autopsy complete gross and microscopic examination of all tissues was carried out.

DATA

Hueper⁶ and others have pointed out that there are three classes of macromolecular substances found worthy of consideration as plasma extenders. These are proteins, including serum albumin, globulin, bovine plasma, and the gelatins, carbohydrates, including gum acacia, glycogen, pectin, dextran, and okra, and the synthetic polymer, polyvinylpyrrolidone.

Proteins as Plasma Expanders—Gelatin, the incomplete protein derived from the collagen of bones and skin and degraded by several different methods, has been widely used during the last war and is commercially available. The gelatin concentrations in solutions available vary from 3 to 6%, and the viscosities and oncotic pressures vary not only as to the percentage but also according to the amount and type of degradations. Gelatin (5%) supplied by the Upjohn Company has a relative viscosity of 8.12 to 14.0 and an oncotic pressure of 69 to 75 cm of water at 25 C while that supplied by the Baxter Laboratories (6%) has a relative viscosity of 5.45 and an oncotic pressure of 75 to 80 cm of water at 25 C. Both of these solutions solidify on refrigeration. These products apparently correspond to the commercial preparation of special gelatin solution, intravenous, which is degraded with heat for shorter periods and has an average molecular size of above 30,000. In 1942, Pauling and his associates⁷ prepared gelatin by using glyoxal and hydrogen peroxide to degrade the molecule to a smaller size. The resulting product, oxypolygelatin, has a molecular weight of about 30,000 to 40,000 and does not solidify at temperatures above 5 C. Oxypolygelatin, in 5% solution, has a relative viscosity of 2.25 and an approximate oncotic pressure of 39 to 45 cm of water at 25 C, both values being somewhat higher than those of plasma. Pulaski⁴ has recently mentioned a "fluid" gelatin, prepared by treatment with an aromatic amine that solidifies at 0 to 4 C in 6% solution. This report further states that in "hemorrhagic hypotensive

shock" the new preparation appears more effective than other gelatins or dextran. This product may be identical or at least similar to the "modified fluid" gelatin reported by Parkins, Perlmutt, and Vars.⁸

In combating hematogenic shock in dogs, the gelatins are effective not only in establishing a prompt rise in blood pressure but also in assuring recovery. Typical data, using plasmoid gelatin as the replacement fluid, are shown in figure 1. In the hemorrhage replacement technique employed, 100% or eight of eight animals survived with 5% plasmoid gelatin, 83% or five of six survived with 6% gelatin, and 67% or four of six survived with 5% oxypolygelatin. This indicates the superiority of 5 and 6% gelatin over 5% oxypolygelatin as a plasma expander.

Tissue changes produced by gelatin solutions consist chiefly of transient swelling of the tubular epithelium of the kidney and temporary storage in the liver and reticulo-endothelial system. Recent histological studies on rabbits who received 15 cc per kilogram every other day for five injections showed a giant cell reaction in the lung (fig 2A).

Fig 1—Effect on blood pressure of 5% plasmoid gelatin (PG) used as the plasma expander. A dog weighing 17.1 kg was bled until it lost 4% of its body weight after the 684 cc of blood was removed the hematocrit was 47.5% (1). Then it was bled for 70% of the amount of the first bleeding with the hematocrit being 28.3% (2) and finally for 48% of the first bleeding with the hematocrit being 14.8% (3). The blood pressure at the end of the third infusion of gelatin was 134 mm Hg and the hematocrit 12%. The dog survived. The arrows pointing down indicate the times of bleeding and ones pointing up the times of infusion of gelatin.

There is difference of opinion concerning the percentage of gelatin metabolized, but all workers agree that some of it is utilized. The excretion of gelatin by the kidney depends for the most part on the molecular size. As many as 50% of the molecules weighing over 30,000 to 35,000 are reported to be retained for 24 hours.

Carbohydrates as Plasma Expanders—Dextran, according to Bull,⁹ is a biosynthetic polysaccharide composed of glucose units produced by the growth of

Leuconostoc mesenteroides in sucrose through enzymatic action. As first precipitated with acetone, dextran appears as a sirupy gum with long chain molecules of such large size (probably at least 1 million) that degradation by acid hydrolysis is necessary to get a substance suitable for intravenous use. Many small molecules also result but the desirable range, about 75,000, can be obtained through fractional precipitation with acetone. Dextran (6%) supplied in limited quantities to us through the National Research Council is a pale straw-colored solution with a viscosity of 3.16 to 3.66 and an oncotic pressure of 65 to 70 cm of water at 25°C.

Dextran in 6% concentration has excellent characteristics for restoring the blood pressure following hemorrhage. In fact, the blood pressure elevation following three hemorrhages and replacements usually exceeds the blood pressure at the onset of the procedure, as illus-

Fig 2—A section of lung of rabbit which was killed after it was given 15 cc per kilogram of body weight of 5% oxypolygelatin every other day for five injections. Foreign body giant cells and a granuloma can be seen (medium power). B section of liver of rabbit which was killed after being given 15 cc per kilogram of 6% dextran every other day for five injections. The liver shows necrosis of the liver cells, foreign body giant cells, and round cell invasion (medium power).

trated in figure 3. The survival rate in these experiments with dextran was four of six animals or 67%. Studies in progress on this expander may raise this percentage.

When administered intravenously to mice and rabbits, it is well tolerated. Allergic reactions, as reported by Pulaski⁴ in rats and man, were not observed in our mice, rabbits, or dogs. Immature mice receiving 15 cc per kilogram of a 6% solution three times per week to a maximum of 46 injections continued to develop and to gain weight. Young rabbits averaging 2 kg in weight who received a comparable amount every other day for five injections showed no gross effects.

Bull and associates,⁹ Craig and others,¹⁰ and Pulaski⁴ have reported that dextran compares favorably with or

is actually superior to other currently investigated expanders Pulaski states that after injection of C¹⁴-tagged dextran in the dog, the urine shows 65 to 70% of the radioactivity, with 4 to 6% in the expired CO₂ and 3 to 5% in the viscera at the end of 72 hours This indicates that at least 25% remains "lost" C¹⁴-marked material was found also in the liver, spleen, and lymph nodes The

Fig 3—Effect on blood pressure of 6% dextran solution (D) used as the plasma expander A dog weighing 10 kg was bled until it lost 4% of its body weight after the 401 cc of blood was removed the hematocrit was 50% (1) Then it was bled for 70% of the first bleeding with the hematocrit being 22.8% (2) and finally for 48% of the first bleeding with the hematocrit being 10% (3) The blood pressure at completion of the third infusion of dextran was 134 mm Hg and the hematocrit 9% The dog survived The arrows pointing down indicate the times of bleeding and the ones pointing up the times of infusion of dextran

latter observation corresponds with our histological findings in mice and rabbits The production of foam cells in the reticuloendothelium of the lymph nodes and in the lungs in mice and focal necrosis of the liver in rabbits was most striking The pathological findings in the liver are shown in figure 2B

Fig 4—Effect on blood pressure of 3.5% polyvinylpyrrolidone (PVP Macrose) as a plasma expander A dog weighing 18 kg. was bled until it lost 4% of its body weight after the 720 cc of blood had been removed the hematocrit was 57% (1) Then the animal was bled for 70% of the first bleeding with the hematocrit being 25% (2) and finally for 48% of the first bleeding with the hematocrit being 14% (3) At the end of the third infusion of polyvinylpyrrolidone the blood pressure was 78 mm Hg and the hematocrit 9% The dog survived The arrows pointing down indicate the times blood was withdrawn and those pointing up the times polyvinylpyrrolidone was infused

Synthetic Polymers as Plasma Expanders—Polyvinylpyrrolidone (PVP) is a colloid produced through the chemical combination of formaldehyde and acetylene

Weese¹¹ first tried it as a plasma extender in Germany during the last war and many reports of its clinical application have been made Studies on tissue retention have also been numerous The imported polyvinylpyrrolidone material used by us was furnished by the General Aniline Corporation The molecular weight of the 3.5% solution is reported to be approximately 40,000, the viscosity was found to be 2.14 to 2.20, and the oncotic pressure, 33 to 35 cm H₂O Another polyvinylpyrrolidone preparation, PVP-Macrose (3.5%), as supplied to us by the Schenley Laboratories, has a higher molecular weight (65,000 to 70,000) than the imported product The oncotic pressure was found to be 38 to 40 cm H₂O at 25 C and the relative viscosity, 2.11 to 2.26 Both of these solutions are stable, nontoxic, and nonantigenic in mice and rabbits Mice tolerate this expander intravenously, but both the rabbit and the dog show imme-

Fig 5—A section showing thrombosis in the pulmonary vein of a dog weighing 8.5 kg that had received 744 cc of a 3.5% polyvinylpyrrolidone solution (PVP Macrose) in a hemorrhage replacement experiment (medium power) B section of lung of rabbit that was killed after being given 15 cc of 3.5% PVP Macrose per kilogram of body weight every day for five injections A foreign body giant cell reaction can be seen (medium power)

diate reactions unless a preliminary injection is given 24 hours in advance

In evaluating polyvinylpyrrolidone in the dog by the survival method, one must administer a desensitizing dose (2 to 3 cc per kilogram) of polyvinylpyrrolidone at least 24 hours prior to the experiment. If this is done, untoward reactions, especially prolonged hypotension, are avoided A characteristic tracing of blood pressure in a hemorrhage-replacement study with PVP-Macrose is shown in figure 4 Although this polyvinylpyrrolidone as an expander does not create as prompt nor as marked an elevation in blood pressure as do the gelatins and dextran, survival figures are comparable In our experi-

11 Weese H Indifferente Kolloide in innerer Medizin und Chirurgie Deutsche med Wchnschr 76 757 761 1951

ence, PVP-Macrose is superior to the imported product in counteracting hemorrhagic hypotension. The imported polyvinylpyrrolidone allowed only a three of six or 50% survival rate, whereas PVP-Macrose brought about recovery in six of seven or 86% of the animals.

Pulaski states that 40 to 60% of injected polyvinylpyrrolidone is excreted unchanged by the kidneys in the first 24 hours. Definite storage can be demonstrated with polyvinylpyrrolidone tagged with I^{131} or C^{14} . In our studies with the General Aniline polyvinylpyrrolidone storage was well marked in the endothelial cells of blood vessels, the reticuloendothelial cells, the liver, and the kidney in the mouse. In the survival studies on dogs, signs of retention were encountered in tissues taken at autopsy. Figure 5A depicts a pulmonary vein showing thrombus formation in a dog weighing 8.5 kg that had received 744 cc of polyvinylpyrrolidone as blood replacement. Foreign body giant cell reactions were observed in the lungs of rabbits receiving 15 cc per kilogram every other day for five injections of PVP-Macrose, but retention in the endothelial and reticuloendothelial cells was less striking (fig 5B).

COMMENT

The available plasma expanders have been evaluated as to those characteristics that are required of an effective substitute for plasma. Molecular weight, oncotic pressure, pH, and relative viscosity data are summarized in table 1.

Gelatins, dextran, and polyvinylpyrrolidone have been studied in mice, rabbits, and dogs. Mice and rabbits have been used from the standpoint of tolerance, growth, development, and tissue changes during and after the intravenous injection of these colloids. The effectiveness of these plasma expanders in restoring the blood volume after three hemorrhages is shown by the kymographic

TABLE 1—Data Relating to the Characteristics Required of Effective Plasma Expanders

	Approximate Molecular Weight	Approximate Oncotic Pressure Cm H ₂ O at 25°C	pH Range	Relative Viscosity to H ₂ O at 20°C
Gelatin 6%	60,000-80,000	70-80	6.80-7.07	4.62-5.50
Plasmoid gelatin 5%	40,000-60,000	60-75	6.58-6.79	8.12-14.00
Oxypolygelatin 5%	10,000-48,000	80-45	4.98-6.17	1.08-2.25
Polyvinylpyrrolidone (Imported) 3.5%	40,000 (average)	33-35	0.13-7.0	2.14-2.20
PVP Macrose 3.5%	65,000-70,000	33-40	6.63-7.07	2.11-2.26
Dextran 6%	31,000-58,000	65-70	5.00-6.22	3.16-3.66

tracings of the blood pressure. The gelatins seem to give somewhat better immediate and sustained blood pressure responses as well as a higher percentage of survivals. This observation may have its explanation in the greater molecular weights, higher oncotic pressures, and increased relative viscosities of the heat-degraded gelatins.

No immediate toxic or allergic reactions were observed with these colloids in mice or rabbits. Reactions in dogs were seen only with polyvinylpyrrolidone when the recommended preliminary injections were omitted.

Survival data obtained in hemorrhage-replacement experiments on the plasma expanders studied are summarized in table 2. The hyperoncotic properties of 5 to 6% gelatin and dextran establish blood pressures following three hemorrhages that exceed the existing pressure at the time of the first massive hemorrhage. Polyvinyl-

TABLE 2—Rate of Survival in Experiments in Which Blood Was Replaced with Plasma Expanders

Plasma Expander	No that Survived	Survival Rate %
NaCl 0.85%	0 of 7	0
PVP (Imported), 3.5%	3 of 6	50
Dextran 6.0%	4 of 6	67
Oxypolygelatin 5.0%	4 of 6	67
Gelatin, 6.0%	5 of 6	83
PVP Macrose, 3.5%	6 of 7	86
Plasmoid gelatin 5.0%	8 of 8	100

pyrrolidone, with an oncotic pressure only slightly higher than plasma, is less effective in maintaining normotension, yet the survival rate is almost as good.

Tissue retention with foreign body giant cell as well as foam cell formation was observed with the various gelatins as well as the other preparations for the first time in rabbits. This is in agreement with the tissue changes previously reported in mice with pectin, dextran, and polyvinylpyrrolidone. The localization was in the lungs and liver.

CONCLUSIONS

After this second year's work on the experimental use of the plasma expanders, the data support the view that the gelatins are the most promising class of substances used for this purpose. The emergency use of dextran and polyvinylpyrrolidone in limited quantities as well as gelatin is justified in the treatment of shock states. The tissue changes observed should not interfere with function unless greatly exaggerated and multiplied.

Q Fever.—The importance of ticks as a reservoir of *C. burnetii* is shown by the large number of species found naturally infected or capable of experimental transmission, their wide spread geographical distribution, the profuse multiplication of rickettsiae within infected ticks and the failure to implicate any other group of arthropods. However, ticks have very little relation to human infection. On the other hand, the reservoir of infection represented by cows, sheep and goats is very important as a source of human infection. Infectivity resides particularly in placenta and milk. Human case-to-case infection is on record, but is rare.

The association of 'Q' fever patients with the animals from which they were presumably infected shows all degrees of closeness. Some patients were occupationally in immediate contact with animals, some resided near by. Infection was occasionally carried on clothing and very often in dust. Some times the association with animals was remote but traceable. Sometimes no association at all could be discovered. The high resistance of *C. burnetii* to heat and desiccation allows contaminated material to retain its infectivity for long periods during which it may be transported to a distance. Inhalation is the mode of entry of *C. burnetii* into man in the great majority of cases. A small but definite group appears to be due to the ingestion of raw milk. Occasional examples of other portals of entry may be found. —E. H. Derrick, The Epidemiology of "Q Fever. A Review, *The Medical Journal of Australia* Feb 21, 1953.

ORALLY ADMINISTERED HEXAMETHONIUM CHLORIDE IN HYPERTENSION

John H Moyer, M D , Sam I Miller, M D
and
Ralph V Ford, M D , Houston, Texas

Causative factors in the development of hypertension are numerous, however, one common denominator in the hypertensive state appears to be sympathetic predominance over the vasoconstrictor mechanisms responsible for maintaining arterial blood pressure. Today, there are available a number of therapeutic agents that are capable of lowering the blood pressure by "blocking" the flow of nervous impulses over the sympathetic nervous system. The majority of these drugs are impractical for routine use, because of the development of tolerance or the presence of untoward side-effects or because they are destroyed in the gastrointestinal tract and must, therefore, be given parenterally. Despite this fact, great impetus has been given to the search for more effective agents that can be administered orally and that will lower the blood pressure on a long-term basis and thus arrest the progression of the disease. Frequently, original reports on potential hypotensive drugs are enthusiastic, yet, when the drugs are distributed for general use, the results cannot be duplicated. This has been especially true when the preliminary drug evaluation has been carried out with hospitalized patients under the strict control of highly specialized investigative teams. Failure of subsequent investigators and physicians in general office practice to reduplicate the results is due largely to the fact that exact control of the patient's activities and the drug administration cannot be maintained as well on an outpatient basis. It is the purpose of this report to present results on the treatment of hypertension with orally administered hexamethonium chloride, an effective autonomic ganglionic blocking agent. Since these studies were conducted on an outpatient basis, the problems encountered will closely parallel those met in general office practice. The results are compared with those obtained with other currently available hypotensive drugs that have been used in this same clinic under similar circumstances.

METHOD AND MATERIALS

At the start, a group of 98 unselected ambulatory patients who attended the medical and cardiac clinics and 35 private patients were given hexamethonium orally, however, 13 were lost to the study because they moved from the area or because they failed to return to the clinic. All of the remaining 120 patients had blood pressures, as measured in both the supine and upright positions, of 160/100 mm Hg or greater. They appeared at the clinic at weekly or semiweekly intervals for six weeks to three months before being given the drug. Some of the more seriously ill patients were hospitalized for the induction of drug therapy and were not followed for so long a control period. There were 40 men and 80 women, whose ages ranged from 26 to 71 years. All were subjected to the usual laboratory tests for evaluating patients with hypertension. These included electrocardiogram, chest roentgenogram, eye ground examination, routine

urinalysis, urine concentration, phenolsulfonphthalein excretion, urea clearance, and blood urea nitrogen determinations. Following the control periods, during which the patients received only supportive therapy and placebo medication, therapy with the chloride salt of hexamethonium was started, and the patients were followed at weekly or semiweekly intervals as outpatients. The severer the hypertension, the more frequently the patients were seen. When special problems arose, the patients involved were seen in the clinic every day or were hospitalized. During the initial studies some patients were treated with the bromide rather than the chloride salt, but an analysis of the results indicated that there was no difference in the hypotensive response.¹ Because of the potentiality of brominism,² the use of the bromide salt was discontinued. The control as well as the follow-up blood pressure determinations were taken in both the supine and upright positions at the time of each visit of the patient to the clinic. This is necessary for adequate evaluation, because the hypotensive response is predominantly orthostatic, which is also true with the use of other ganglionic and adrenergic blocking drugs. The blood pressure was determined by the investigator on each clinic visit as well as by the clinic nurse at the time the patient registered in the clinic and several hours later, just prior to the patient's return home. These multiple observations over a three to four hour period offered an additional opportunity for evaluating variations in blood pressure between doses of the drug. The control supine and upright blood pressure for each patient in the present report was determined by taking the average of all blood pressure observations during the control period in each position. The post-drug blood pressure is the average of the values obtained after the titration period (during which the blood pressure and drug dosage were being stabilized). In addition to the observations on blood pressure, clinical manifestations of excessive hypotension, such as dizziness on standing and excessive weakness during certain parts of the day, were taken into account while adjusting the dose schedule. The initial dose of hexamethonium was usually 250 mg. four times a day, given orally with each meal and at bedtime. Taking the drug with meals was found advisable in most patients, because it decreased the variation in gastrointestinal

absorption of the drug. Also, mealtime and bedtime were good reminders to the patients to take their medicine. Although a more constant blood level of hexamethonium no doubt can be maintained if the drug is administered in smaller doses every three to four hours around the clock, when this technique was followed, most of the patients objected to the routine and were less dependable in taking their medicine than when the drug was given as outlined above. Because of the psychogenic aspects of hypertension and because too much of the patient's attention has already been focused on the disease, such considerations as dose schedule become of utmost importance if therapy is to remain practical over a long period. The dose of hexamethonium was gradually increased in a stepwise fashion until an adequate blood pressure response was obtained or until side-reactions forced discontinuance of use of the drug. One week was allowed between changes in the dose schedule, unless the patient was in the hospital during the titration period. An example of the titration method for establishing the dose schedule is as follows:

	7 A.M.	12 Noon	5 P.M.	10 P.M.
1st week	250 mg	250 mg	250 mg	250 mg
2nd week	500 mg	250 mg	250 mg	500 mg
3rd week	500 mg	500 mg	500 mg	500 mg
4th week	750 mg	500 mg	500 mg	750 mg

In raising the dose of hexamethonium, the morning dose and that taken before retiring were increased first, since the interval between these two (in which the patient did not receive medication) was greater than at any other time during the 24 hour period. This also helped avoidance of excessive increases in blood concentrations of hexamethonium during the afternoon and early evening. Several patients who showed too much variation in blood pressure between doses were given the drug in smaller amounts more frequently.

RESULTS

Thirteen of the original 133 patients were lost from the study for one reason or another. This does not include any of the patients who were dropped because of prohibitive side-reactions or death. For purposes of analysis, the remaining 120 patients on whom adequate follow-up could be maintained have been divided into three groups, according to the diastolic blood pressure. Group 1 consists of 29 patients with less severe hypertension, in whom the average diastolic pressure during the control period was more than 100 but less than 120 mm Hg, group 2 consists of 58 patients in whom the control diastolic pressure was more than 120 but less than 140 mm Hg, and group 3 includes 33 patients with the severest hypertension, in whom the diastolic blood pressure was more than 140 mm Hg. The patients who failed to respond to treatment were predominantly Negro women. This latter observation probably reflects inability to cooperate with the therapist rather than any variation in pharmacological response to the drug.

Some of the pertinent clinical and vital data on these patients are summarized in table 1. About one-third of the patients had evidence of renal impairment prior to therapy, as indicated in the renal function studies employed. Of the patients in group 1, only 4 of 29 showed evidence of renal involvement, whereas in group 3

(diastolic pressure above 140 mm Hg) over half showed evidence of impaired renal function. This did not indicate that renal disease preceded the hypertension. More likely the reverse was true in most instances, since patients with frank evidence of acute or chronic nephritis were not included in the study. The blood urea nitrogen level was elevated in 9 instances, and numerous red cells were found in the urine of 22 patients (table 2). Most of these patients fell into group 3, additional evidence of the severity of the disease in this group. Eight patients in group 3 and 12 in group 2 were classified as having malignant hypertension. About one-third of the patients had evidence of congestive heart failure. This had already been treated prior to hexamethonium therapy in most instances. In a few of the patients with less severe failure, no cardiac therapy was inaugurated in order to evaluate the effect of blood pressure reduction alone on the clinical course of heart failure. Thirty-one patients complained of precordial pain prior to therapy. This was typically anginal in type in 15. Three of these patients had previously had myocardial infarction. Three additional patients who had had coronary occlusions had no residual anginal pain. The electrocardiograms during the control periods were interpreted as being abnormal in 92 patients included in the present study. In 48 there was evidence only of left ventricular hypertrophy, whereas in the remaining 44 there was evidence of frank myocardial damage. Cerebrovascular disease was present in 22 patients, as evidenced by previous cerebral arterial occlusions or hemorrhages or by the presence of encephalopathic manifestations.

The blood pressure responses of the three groups of patients are presented in table 3. The period of follow-up after receiving hexamethonium varies from 3 to 18 months. For purposes of evaluating drug tolerance, hypotensive response, and clinical improvement, the patients in each group have been subdivided according to the follow-up period as of the present time, i.e., 3 to 6 months, 6 to 12 months, or 1 year or longer. Table 3 shows the mean blood pressure values for all patients in each group and subgroup who showed a reduction in mean blood pressure of 20 mm Hg or more as well as the mean values for the unresponsive patients in each group. There was no evidence to indicate that increasing amounts of hexamethonium were required with time to maintain the hypotensive response, that is, that drug tolerance occurred, since the patients who were treated for one year or more did not require more of the drug after this period than patients who had received it for only three months. In looking over individual patients' records, it was observed that a number of patients required more drug per day after one year than they did initially, but just as many required less. There was no obvious answer to account for the variability of drug requirements from time to time, however, it was noted that during periods of increased activity or hot weather the drug requirement decreased. This may represent decreased excretion due to depressed renal function at these times. On the other hand, periods of increased nervous tension usually increased the amount of drug necessary to control the blood pressure. If the blood pressure was reduced excessively, the amount of drug required to maintain the hypotensive response was less than if the

blood pressure was allowed to remain at mildly elevated levels, probably owing to changes in the glomerular filtration rate and variations in the drug excretion rate. Patients in all three groups who were considered unresponsive to the drug received as large as or larger average daily amounts than the responsive patients.

The reduction in blood pressure was greater in the upright position than in the supine. Percentagewise, there

standing of each patient's problems and idiosyncrasies by both the physician and the patient himself over a longer period.

The initial side-effects associated with hexamethonium therapy were numerous, but in very few instances were they prohibitive or serious enough to cause concern. This was not the case if the dose of the drug was built up too rapidly and the blood pressure was reduced exces-

was often more of a decrease in systolic than in diastolic blood pressure while standing. In the supine position, the percentile reduction in systolic and diastolic pressure was about equal. Since the drug blocks off the sympathetic innervation to the heart (fig 1), reflex tachycardia usually did not accompany the reduction in blood pressure. When compared with the control observations, the average blood pressure for patients with severer hypertension (group 3) was lower in those who had been followed for six months to a year than it was in those who had been followed for only three months. This probably reflects greater stability of the blood pressure and better under-

standing by overshooting the point at which the dose of the drug was optimal. When this occurred, syncope on standing was almost always seen. At the same time, the patient complained of weakness, dryness of the mouth, blurred vision, and difficulty in defecation. All these improved as

* One of the authors (J. H. M.) has had occasion to observe two patients elsewhere treated by a more rapid titration method under hospital conditions in whom segmental paralytic ileus developed. In one of these the ileus was relieved within 18 hours after use of the drug was stopped. The second patient was in severe uremia (and had been prior to therapy also with a blood urea nitrogen level of 150 mg per 100 cc.) and had associated lower abdominal pain. The attending physician and a surgical consultant, being aware of this complication, performed a laparotomy and the patient died within four days from progressive uremia.

the drug was excreted and the blood pressure rose to normotensive or mildly hypertensive levels. When excessive reduction in blood pressure caused concern, any of the peripherally acting vasopressor agents were effective as antidotes for raising the blood pressure, since hexamethonium has no peripheral blocking action. Excessive hypotension and constipation were the most difficult side-effects to handle effectively and still control the hypertension. Cholinergic drugs were of little value for the correction of constipation. Cathartics, in the form of cascara sagrada, liquid petrolatum (mineral oil), and magnesium hydroxide (milk of magnesia), were adequate and were used freely whenever indicated. Intermittent nausea, occasional vomiting, and abdominal cramps were seen frequently, but these were usually observed during the initial period of therapy. Most of the side-reactions decreased as treatment continued. There was one exception. Diarrhea was seen more frequently in patients who

blood pressure was adjusted to strict normotensive levels. The difference between the supine and upright blood pressure reduction in many patients tended to decrease as therapy was continued, but some orthostatic effect was present even in those who received the drug for a year or more (table 2). Urinary retention occurred in three patients, but in each instance the dosage had been increased rapidly. Hexamethonium therapy was abandoned in two of the three patients, after which this symptom was completely relieved. The retention subsided spontaneously in the third patient, despite continued drug administration. Many of the men experienced some degree of impotence but no alteration in sexual drive. Attempts to occasionally relieve this symptom by omitting the night dose proved ineffective unless the blood pressure also escaped from control. Therefore, in most patients with very severe hypertension, it was thought inadvisable to overcome this complaint or to bring the

had been receiving the drug for prolonged periods. Even after the patients had been on the drug for long periods, if they obtained an increased response to the drug, owing to increased intake, increased absorption, or decreased excretion, the previous symptoms returned as the blood pressure dropped. This was especially true of fatigue, blurred vision, and constipation. Orthostatic dizziness was experienced at some time by the majority of the patients. This suggests excessive reduction in blood pressure. If it occurs at the same time each day, it is an indication for reducing the amount of drug being ingested in the preceding dose. A history of recurrent orthostatic dizziness between clinic visits was of considerable value to the physician in arriving at a correct dose schedule. Owing to some day to day variation in the blood pressure of most patients, an attempt was made to regulate the upright blood pressure at levels slightly above normal (150/90 to 100) to avoid periods of excessive orthostatic hypotension and syncope. Persistent dizziness when standing occurred almost invariably if the supine

possibility to the patient's attention. On withdrawal of hexamethonium, the symptom was always relieved.

The most outstanding symptomatic improvements were the relief of headache and angina pectoris. This occurred in three-fourths of the patients with these complaints. Precordial pain associated with the hypertension but not typically anginal in type was also relieved as the blood pressure was reduced. Eyeground examination showed definite objective improvement in numerous instances. This was in the form of reduction of hemorrhages and exudates, which was usually associated with improved vision. Of 53 patients with grades 3+ and 4+ (Keith-Wagener classification) changes due to hypertensive vascular disease, improvement to the next grade or better was noted in 68%. All but two of the patients showing improvement also obtained a significant reduction in blood pressure. In the two exceptions, spontaneous improvement occurred. Although an increase in phenolsulfonphthalein excretion was not observed in most of the patients, progressive impairment also did not

occur as long as the blood pressure could be controlled. The presence of albumin and red cells in the urine, which was observed during the control studies in many of the more severely hypertensive patients, was diminished. This was especially true in the case of intermittent hematuria that accompanied exacerbations in the hypertension. Of the nine patients with azotemia, three showed a good blood pressure response, but the blood urea nitrogen level increased during maximum hypotensive therapy. This was reversed in one of the three when the blood pressure was allowed to increase to a moderately hypertensive level but one that was still considerably below the control value. Therapy was discontinued in the second. The third patient had malignant hypertension and broke out of control as soon as the dose of hexamethonium was decreased. The blood urea nitrogen level was elevated but returned to normal as the blood pressure

responded to treatment but broke out of control, rapidly progressed downhill, and died. Therefore, they are included in the unresponsive group in the present report. Four patients who died never obtained a reduction in blood pressure. Three of these were also given combined hexamethonium and hydralazine (Apresoline) therapy, according to the method of Schroeder, without a response being obtained. The eighth death was due to a cerebral hemorrhage that followed abandonment of therapy on the patient's own volition and against medical advice. None of the patients who obtained and maintained a good reduction in blood pressure with this therapy have died.

Forty-four patients who have been treated with orally administered hexamethonium and who have been followed for one year or more are available for long-term comparison with other patients treated in the same clinic.

§ Four discontinued therapy on their own volition after this length of time and for four others another hypotensive agent (hydralazine) was added to the therapy.

decreased in four patients in the responsive group. Two of the nine patients had malignant hypertension and showed no blood pressure response to the drug. Both have since died as a direct result of their hypertension. The symptoms and signs of heart failure improved as the blood pressure was reduced in about two-thirds of the patients. This occurred in patients who had previously received digitalis and diuretics as well as in the patients who had not received specific therapy for heart failure. Improvement of the cardiac status was verified by observation of a decrease in heart size seen on roentgenograms in numerous instances. In general, the electrocardiograms that showed a left ventricular strain pattern improved, however, when evidence of frank myocardial damage existed, little change was observed. Patients with malignant hypertension and simultaneous cardiac failure and severe renal disease were especially resistant to hypotensive therapy. During the course of this study, eight patients died. Three had malignant hypertension associated with renal disease and heart failure. They originally

with other hypotensive drugs. Eight of the 44 failed to obtain a good initial therapeutic response and are included in the unresponsive group. Four others have discontinued use of hexamethonium on their own volition after one year, although they had initially obtained and had continued to have a satisfactory reduction in blood pressure (table 4). In four other patients, hydralazine was added to the therapeutic program, despite an initial and maintained reduction in blood pressure for one year or more when hexamethonium had been used alone. This was done either in an effort to obtain a greater reduction in blood pressure with less side-effects or because the blood pressure seemed excessively labile when hexamethonium was used alone. Therefore, hexamethonium alone has been found to be a satisfactory therapeutic agent for the treatment of hypertension in 64% of the patients who have been treated for one year or more. There is no indication at this time that the drug will not continue to be effective indefinitely in this group of responsive patients.

PHARMACOLOGICAL ACTION

Therapeutic agents that are capable of lowering the blood pressure through their action on the nervous system can be divided essentially into three groups, according to their primary site of action (1) centrally acting drugs (on the brain), which depress the central outflow of vasoconstrictor impulses (hydralazine and Veratrum viride extracts), (2) ganglionic blocking drugs, which block the transmission of impulses through the autonomic ganglions (hexamethonium), and (3) peripheral blocking agents, which block the transmission of impulses from the sympathetic nervous system to the end organ (phentolamine [Regitine] and Dibenzylamine [N-phenoxypipropyl-N-benzyl- β -chloroethylamine hydrochloride]).

Fig 1—Representation of the ganglionic blocking action of hexamethonium. The transmission of vasoconstrictor and cardiac accelerator impulses over the sympathetic nerves to the heart and blood vessels is interrupted following administration of hexamethonium causing a reduction in blood pressure without a significant change in pulse rate (Dibenzylamine is N N-dibenzyl β -chloroethylamine).

side)] Certain drugs, such as Hydergine (methanesulfonates of dihydrogenated ergotoxine alkaloids), affect more than one focus by acting both centrally and peripherally. Hexamethonium falls into the ganglionic-blocking group of drugs (fig 1). It, like tetraethyl-

ammonium, is exceptional by comparison to other known ganglionic paralyzing agents in that it does not stimulate the ganglions prior to paralysis. It differs from tetraethyl ammonium in that the paralysis lasts longer and the hypotensive effect is much less variable and more prolonged. Hexamethonium belongs to the bismethonium compounds, which are composed of two ammonium radicals in which the hydrogen ions are replaced by methyl and halogen groups and which are united by a chain of a varying number of methyl groups. The compound so formed is named according to the number of methyl groups in the chain between the two nitrogen atoms. Thus, a compound with 10 methyl groups in the chain is called decamethonium (C_{10}) and one with 6 methyl groups, hexamethonium (C_6). The C_{10} derivatives have been found to have a curare-like action. When hexamethonium produces ganglionic blockade, it blocks the parasympathetic as well as the sympathetic ganglions. Most of the side-effects associated with the reduction in blood pressure can be attributed to the curare-like effect (weakness and fatigue), parasympathetic ganglionic blockade (constipation, urinary retention, dry mouth, and anorexia), or excessive hypotension (dizziness and syncope), which is predominantly orthostatic. Since the drug blocks the cardioaccelerator ganglions to the heart, reflex tachycardia after blood pressure reduction does not occur with hexamethonium as it does following comparable reduction by adrenergic blocking drugs and other means.

When blood pressure is reduced, the cerebral vessels dilate and cerebral blood flow and cerebral metabolism are maintained³, however, if the pressure is reduced excessively, cerebral blood flow decreases, and disturbances in cerebral function follow^{4b}. This is more likely to occur in the upright position (fig 2), especially if not accompanied by muscular activity, since reflexes responsible for readjusting vasoconstriction to changes in position are also blocked by hexamethonium. Therefore, the blood pressure should always be measured in both the supine and upright positions in evaluation of ganglionic blocking drug therapy. If cerebral ischemia is to be avoided while the patient is standing, the blood pressure should be adjusted with the patient in the upright position. Note in figure 2 that reduction in blood pressure in the supine position had no significant effect on cerebral blood flow or cerebral oxygen uptake, because of the reduction in cerebrovascular resistance, a result of cerebral arterial dilatation. In the upright position, there was a slight reduction in cerebral blood flow. Further reduction in systemic blood pressure was apparently minimized by active motion of the extremities, thus maintaining adequate venous return of blood to the heart. In the 45 degree head-up position with passive tilting there was an additional sharp reduction in systemic blood pressure, and cerebral blood flow was reduced. The patient complained of dizziness just prior to the termination of this aspect of the study. These observations have therapeutic significance with regard to the effect of blood pressure reduction on cerebrovascular hemodynamics. Passive head-up tilt should be undertaken with extreme caution in these patients.

Following acute blood pressure reduction with hexamethonium (studies in supine position) there is an initial depression of renal function.⁴ Glomerular filtration gradually returns to normal, however, despite a maintained reduction in blood pressure, provided⁶ the reduction is not excessive. The patient whose course is shown in figure 3 was admitted to the hospital in a semicomatose state associated with a hypertensive crisis. The blood pressure was reduced acutely with parenterally administered hexamethonium, and renal functions (glomerular filtration rate and renal plasma flow) were depressed as the blood pressure decreased. Despite maintenance of the reduction in blood pressure, renal function returned to normal. The patient was later given the drug orally, and, although blood pressure was maintained at 130 mm Hg systolic and 100 mm Hg diastolic, renal function was not depressed in comparison with the pre-treatment levels.

Renal blood flow and the glomerular filtration rate are depressed following exercise in untreated patients

Fig. 2.—Cerebral hemodynamic response to blood pressure reduction with hexamethonium in a patient with malignant hypertension. The effect of reduction in blood pressure in the supine position is contrasted with that in the upright position accompanied by active motion of the legs and that in a 45 degree head-up position with passive tilting.

This also occurs in patients who have been treated with hexamethonium.⁶ Patients with renal damage respond to blood pressure reduction qualitatively, similarly to patients with normal kidneys, but the readjustment is slower.⁴ A few patients fail to completely readjust⁶ to a lowered blood pressure. If readjustment is incomplete, there is little need for concern if renal function is relatively normal, however, if renal function is severely impaired, even small reductions in glomerular filtration may seriously decompensate the excretory capacity of the kidney. Therefore, in the presence of impaired renal function, the therapist must be alert to this possibility. When the blood pressure is reduced excessively, the glomerular filtration rate is depressed, and anuria supervenes, even in the presence of relatively normal kidneys. When this occurs, arterenol infusion will quickly reverse the process, with improvement in glomerular filtration. The patient whose course is shown in figure 4 had a normal glomerular filtration rate during the control period, however, because of excessive reduction in blood pressure with orally administered hexamethonium,

glomerular filtration decreased sharply, and anuria supervened. When this patient's blood pressure was increased by means of arterenol infusion, the glomerular filtration rate and urinary output returned toward the control levels. After 12 hours, when arterenol infusion was dis-

Fig. 3—Acute response of blood pressure and renal function to intramuscularly administered hexamethonium and their status 10 days later during maintenance therapy with orally administered hexamethonium.

continued, the blood pressure remained elevated, and glomerular filtration approximated the control observations.

CLINICAL CONSIDERATIONS

The beneficial effects of blood pressure reduction can be argued pro and con. In the hypertensive state there are three vascular beds that are especially likely to cause complications. These are the cerebral vessels, the heart and coronary vessels, and the renal vasculature. The present studies confirm many previous observations that the vascular stress on the heart and cerebral vessels in patients with hypertension is relieved by reducing the

Fig. 4—Effect of excessive hypotension due to hexamethonium on the glomerular filtration rate in a patient with a normal control rate.

blood pressure. Hypertensive headaches were improved in about four out of five patients with this complaint. Relief was obtained without altering cerebral blood flow. As the blood pressure is reduced, the cerebral vessels dilate (fig 2), and, thus, cerebral blood flow is main-

6 Ford R. V. Moyer J. H. and Spurr C. L. Hexamethonium in the Chronic Treatment of Hypertension—Its Effect on Renal Hemodynamics and the Renal Excretion of Water and Electrolytes. *J Clin Investigation* to be published.

tained, even during treatment for severe and malignant hypertension.^{7b} If the pressure is reduced excessively, complications, such as cerebral ischemia with thrombosis and paralytic phenomena, may be anticipated. This was not observed, although one older patient experienced transient weakness at a time that her blood pressure had declined to 80 mm Hg systolic and 50 mm Hg diastolic in the upright position. As soon as the patient reclined, immediate and complete recovery followed. The manifestations in this instance were probably those of ischemia rather than thrombosis. Apparently, the cerebrovascular dilatation associated with the reduction in blood pressure tends to prevent the formation of thrombi. Certainly, reducing the blood pressure decreases the possibility of occurrence of hemorrhages and small vessel bleeding. This is well demonstrated in the improvement and resolution of retinal hemorrhages in numerous instances as the blood pressure was reduced.

The decrease in precordial pain and improvement of the anginal syndrome in many instances suggests that the ratio of coronary blood flow to oxygen and metabolite demand is improved. In only one instance was coronary pain precipitated by reduction in blood pressure, whereas definite improvement in angina was noted in three-fourths of the patients who had this complication. Improvement was also noted in patients who experienced precordial pain that was not typically anginal in type. Apparently the reduction in work load on the heart compensates for any decrease in coronary flow associated with the drop in arterial blood pressure. It is also possible that ganglionic blockade of either the sympathetic or parasympathetic nerves to the heart inhibits vasoconstrictor impulses traveling to the coronary vessels. In addition, the drug may exert some direct action or it may block afferent sensory nerves traveling over the sympathetics. When the blood pressure was reduced in patients with associated heart failure, cardiac output^{8b} increased, and heart failure improved. This observation suggests that the cardiac efficiency is improved as the work load is reduced.

It can be concluded from the above observations that if cerebral pathological changes or cardiac failure exist either alone or in combination and if they are secondary to severe and prolonged hypertension, attempts to reduce the blood pressure should be undertaken. This is particularly true if renal function is not impaired. Contrariwise, if impairment of renal function predominates, caution must be exercised when reducing the blood pressure, since further impairment of renal excretory capacity may occur. Although the damaged kidney responds to a reduction in blood pressure by vasodilatation in a relatively normal fashion, this occurs more slowly⁷ than in the normal kidney and is occasionally incomplete.

Failure of complete renal hemodynamic readjustment is more likely to occur if the blood pressure is reduced to absolute normotensive or hypotensive levels. In the presence of renal damage, glomerular filtration is critical, and small, absolute changes may throw the patient into frank and progressive renal failure. With normal renal function, the renal reserve is adequate to compensate for minor changes, however, even in this case, if blood pressure reduction is excessive, glomerular filtration is greatly depressed, and anuria supervenes (fig 4). These observations do not indicate that blood pressure reduction is not feasible in the presence of impaired renal function. They do indicate that, when blood pressure reduction is undertaken, it must be done with extreme caution and with constant evaluation of renal excretory function. Any tendency toward an increase in the blood urea nitrogen level is a definite contraindication to further reduction in blood pressure. When this occurs, the blood pressure must be allowed to return to levels at which renal excretory capacity is not further impaired. Blood pressure reduction with hexamethonium should not be undertaken under circumstances in which determinations of the blood urea nitrogen level are not feasible.

COMPARISON WITH OTHER DRUGS

When hexamethonium is compared with some of the other drugs that currently are being used under similar circumstances, the superiority of the former as a hypotensive agent is obvious (table 4), for example, if semi-purified *Veratrum viride* preparations, such as Verloid and Anatensol,⁸ are administered by the oral route, the blood pressure can be reduced significantly for prolonged periods in only a small number of patients. When enough drug is given to consistently reduce the pressure, nausea and vomiting will be experienced by almost all patients. This limits the usefulness of these compounds, and follow-up after one year indicates that 20% of the patients, or less, continue to obtain any reduction in blood pressure. Only in exceptional patients (3 to 7%) can the blood pressure be reduced to levels approaching normotensive values.

The effectiveness of hydralazine (Apresoline) may be limited when given alone, either orally or parenterally, owing to the tachycardia and increased cardiac output that accompany the reduction in blood pressure.⁹ This is a serious consideration in the presence of coronary artery disease, in which myocardial ischemia may develop as a result of the cardiac stimulant effect on a heart in which the coronary arteries are unable to deliver an adequate supply of blood to the myocardium. When the tachycardia is marked, the electrocardiogram shows T wave changes consistent with coronary insufficiency, presumably on the basis of the increased cardiac work.¹⁰ In studies on the isolated heart-lung preparation, there is some evidence that hydralazine may actually increase the blood flow through the coronary vessels. If this occurs in the intact animal it is apparently not adequate to completely compensate for the increased work load on the heart caused by the tachycardia. When the sympatho-

⁹ (a) Freis.¹⁰ (b) Moyer J. H., Handley C. A. and Huggins R. A. Some Pharmacodynamic Effects of 1-Hydrazinophthalazine (C 5968) with Particular Reference to Renal Function and Cardiovascular Response. *J Pharmacol & Exper Therap* 103: 368, 1951.

mimetic effect on the heart is previously blocked off by the use of ganglionic blockade (hexamethonium), hydralazine is a valuable adjunct in the treatment of hypertension, since ganglionic blockade does not alter the vasodepressor effect of the hydralazine but blocks at least part of the tachycardia and increased cardiac output¹⁰ that accompany administration of this drug alone. Out of 25 patients who did not obtain adequate hypotensive response to hexamethonium alone, we have been able to reduce the standing blood pressure to normotensive levels in 9 patients, and, in an additional 6, the systolic pressure was reduced more than 40 and the diastolic more than 20 mm Hg. Schroeder¹¹ has considered use of combined hexamethonium and hydralazine as the method of choice in the treatment of hypertension. In our opinion, the proper use for hydralazine in the treatment of hypertension is as an adjunct to hexamethonium or to surgical sympathectomy in patients who do not obtain adequate reduction in blood pressure when these procedures are used alone. This conclusion is reached because of the greater difficulty in regulating dosages in combined hexamethonium and hydralazine therapy and the higher incidence of side-reactions, which include headache, diarrhea, dyspnea, nausea, vomiting, and occasional paresthesias.

Phentolamine (Regitine), when given orally in effective doses to patients with essential hypertension, is usually associated with nausea, vomiting, weakness, and headache, so that less than 15% of patients can tolerate the drug for longer than one month. After three months, tolerance develops. Perhaps, the cardiac stimulant effect that has been observed occasionally will be a further contraindication to its widespread use, even by the parenteral route.

Dibenzylamine is the most specific and the most effective of the peripherally acting adrenergic blocking agents when taken orally. If the patient would continue taking this drug, hypotension could usually be maintained¹², however, in patients receiving Dibenzylamine reflex tachycardia and palpitations frequently develop as the blood pressure decreases, since the sympathetic nerves to the heart are not blocked. In addition, patients receiving this drug just "feel badly" without being able to identify the complaint, probably a cerebral effect. These side-effects are limiting factors in most instances. The tachycardia is especially difficult to control and is probably a contraindication to the use of this drug in the treatment of hypertension on a long term basis. Tachycardia does not follow the reduction in blood pressure from ganglionic blocking drugs, which block the sympathetic impulses before they reach the heart. Hypotensive reflex tachycardia is not, therefore, a factor in hexamethonium therapy. This is an important reason why long term therapy is so much more successful with hexamethonium than with Dibenzylamine.

SUMMARY AND CONCLUSIONS

1 The results obtained with orally administered hexamethonium in treatment of 120 patients with hypertension are summarized. The patients in this study were

treated as outpatients and were followed for 3 to 18 months after institution of therapy. The conditions of patient care closely paralleled those met in a general office practice. Therefore, the results obtained in the present study should closely parallel those obtainable in a general office practice, provided the therapist understands the pharmacodynamics of the drug and pays strict attention to the regulation of a dose schedule, which is an individual problem for each patient. There is no set dose, and the drug must be titrated in each patient to establish the proper dose schedule. If this is not done, excessive hypotension and serious complications may result.

2 Hexamethonium chloride, when administered orally, was found to be an effective agent for reducing the blood pressure. Of the 120 patients treated, all but 17 responded with a significant reduction in blood pressure. The amount of drug required was only slightly greater in the patients with diastolic blood pressures above 140 mm Hg than in those with diastolic pressures less than 120 but more than 100 mm Hg. No difference could be detected between patients who responded and those who failed to respond, except that patients with severe hypertension complicated by cardiac failure and moderate to severe renal disease seemed to be especially resistant to therapy. After the dose schedules were established, the outstanding problems in therapy were those related to decreased intestinal peristalsis and periodic variability in the hypotensive response. Of the patients treated for one year or more, about 64% are well controlled with hexamethonium as the only therapeutic agent.

Measurement of Adrenal Cortical Function—The response of the adrenal cortex to exogenously administered ACTH is one of the most specific and predictable hormonal measurements available. Occasionally, ACTH given intramuscularly is inactivated or destroyed and hence does not reach its target gland—the cortex. Following the intravenous administration of ACTH, this almost never occurs. The response of the circulating eosinophils to ACTH is highly specific as an indication of increased adrenal secretion of 11,17-oxysteroids, this is not true for epinephrine. The measurement of 17-keto steroid and 11,17-oxysteroid excretion following ACTH administration increases the specificity of the interpretation of the ACTH response and adds an important quantitative evaluation. At present, there is no specific differentiating test for pituitary ACTH deficiency. Progressive increased responsiveness of the adrenal cortex, beginning from a subnormal level, is, however, highly suggestive of either primary, spontaneous pituitary insufficiency or adrenal atrophy secondary to adrenal steroid therapy.—G W Thorn, M D, Measurement of Adrenal Cortical Function, *The Journal of Clinical Endocrinology and Metabolism* May, 1953.

METHOD FOR THERAPEUTIC EVALUATION OF DIURETIC AGENTS ADMINISTERED ORALLY

Theodore Greiner, M D

and

Harry Gold, M D, New York

In the treatment of the patient with congestive failure, the experience of recent years has firmly established the fact that it is the major if not the first order of business to put to work an effective system of diuretic medication. The recognition of this fact has altered the therapeutic approach and results in the management of these patients. In a study published from our clinics a few years ago,¹ it was shown that with the daily mercurial as the nucleus of the regimen for the routine treatment of congestive failure, approximately 90%, instead of the usual 50 to 60%, of hospital patients may be discharged free of congestive failure in an average of about a week, in place of about three or four weeks. One of the points of emphasis in the current planning for this group is that of adequate maintenance with the continued use of potent diuretic agents. The most satisfactory results have thus far been obtained with a maintenance regimen of injections of a mercurial diuretic, some patients being able to carry on satisfactorily with injections at intervals of a week or longer, others requiring two or three injections a week, and some even daily. The problem of frequent injections over a period of years has stirred up interest in the development of new mercurial as well as non-mercurial diuretic agents that might be used by the oral route.

Two of the problems presented by a new orally administered diuretic are similar to those with an injected diuretic, namely, that of diuretic potency and systemic toxicity. The orally administered agent, however, presents a third problem, that of local gastrointestinal irritation and the relation of the intensity of this action to that of systemic toxicity and of diuretic results. This seems to be the chief problem at the present time in regard to the agents currently in use and those experimental materials that we have had an opportunity to examine.

This paper describes results that we have obtained in the endeavor to relate the size of the obstacle of local gastrointestinal irritation to the effectiveness of the diuretic response for several agents that we have recently tested, and calls attention to the kind of orientation that is necessary to understand what can be accomplished and what may be expected of oral diuretic therapy with the materials available at present.

METHOD AND MATERIALS

The diuretic agents shown in the accompanying table were examined for two facts concerning the effects of their oral administration: (1) the diuretic potency and

(2) the incidence of sufficient local gastrointestinal irritation to give rise to unpleasant symptoms such as abdominal distress, diarrhea, nausea, and vomiting. The diuretic potency was determined by a method that was recently developed in our clinics² for the bioassay of diuretic agents in ambulant patients with congestive failure. The method meets the standard requirements for bioassays and yields results with a high degree of reliability, which is tested by the conventional methods for statistical significance. In essence, the technique is as follows: Selected adult ambulant patients with congestive failure in attendance at the cardiac clinics are accurately weighed, receive an intramuscular injection of meralluride (Mercurhydrin) as the standard, are weighed 24 hours later to ascertain the diuretic effect, and return for

Dosage and Effectiveness of Diuretic Agents in Cases of Congestive Failure

Drug	Dose Mg	No of Patients	Effect of the Dose in Terms of Intra- muscular Administra- tions of Meralluride (Cc.)	Per centage of Patients in Whom Gastro- intestinal Symptoms Developed	Rank of Prepara- tions on Basis of D E/ T I*

* D E = diuretic effectiveness of column 3. T I = toxicity incidence of column 4. This is an arbitrary expression showing that one preparation is more favorable than another if it shows a greater diuretic effect for a particular incidence of local toxicity.

† Experimental orally administered preparations not commercially available.

another weighing a week later when the loss of weight is usually restored. This is repeated with different doses of the standard. The various doses and the corresponding weight losses are then plotted against each other to form the dosage-response curve. The same procedure is then repeated with the preparation being tested. In the case of the study of cumulative effects from oral medication it is necessary, as in the case of ammonium chloride, to make use of a longer period, treatment for two days or more, between weighings for the diuretic effect. The results are two dosage-response curves from which the relative potency of the standard and the test preparations may be read off directly. In connection with the various doses of the orally administered material utilized for securing the data of the dosage-response curves, records are made of the incidence of disagreeable gastrointestinal effects. Each assay is based on the average response of

a group of 25 or more patients, the same patients serving both for the standard and the test preparation as a means of reducing sources of error that would arise from differences between different groups of patients

RESULTS

In the accompanying table we have assembled the results of such assays with eight diuretic agents—ammonium chloride, several mercurials, an aminouracil, and xanthines. In order to give the data therapeutic meaning, the results are presented in terms of the dose of the agent, the dose of intramuscularly administered meralluride to which its effect corresponded, and the amount of gastrointestinal trouble encountered in a group of patients with a particular dose. To explain the need for this type of analysis, one might take the position that an orally administered diuretic agent would be ideal if it were possible to obtain with each dose in a patient with congestive failure a diuretic response represented by a weight loss of approximately 2 lb (907.1 gm), as is the usual case with 1 cc of meralluride by the intramuscular route, without gastrointestinal side-effects, and that another agent might be considered quite unsatisfactory if, for example, diarrhea developed in two-thirds of the patients with a dose that provided a weight loss of only about 0.5 lb (226.8 gm), an effect equivalent to the effect of a 0.25 cc dose of meralluride intramuscularly. The diuretic effect is expressed in terms of intramuscular meralluride rather than as actual weight loss, since whether the average weight loss for 1 cc of the mercurial is 1 lb (453.5 gm), 2 lb, or 3 lb (1,360.7 gm) depends on the amount of edema the particular test group shows. This variation in the weight loss for a particular dose of the diuretic agent does not materially influence the results of an assay for potency by the method that we employ, since the method calls for comparing the test preparations with the standard preparation in the same patients. The data for the preparations included in the table were examined for information relating the diuretic potency to the incidence of gastrointestinal irritation, and an arbitrary expression for the relationship has been utilized to facilitate the ranking of the various materials.

It may be seen that all the orally administered materials produce gastrointestinal distress in some patients. It goes without saying that if the oral doses were small enough the incidence of gastrointestinal symptoms would vanish, but also would the diuretic response. We have therefore selected for inclusion in this table those doses of the various materials that would produce gastrointestinal symptoms in as high as from one-fourth to one-half of the patients, since even here the corresponding doses produced only moderate diuretic effects, and since with lower doses showing less gastrointestinal irritation the diuretic responses become negligible.

The results show that there are marked differences between different diuretic agents given orally when they are examined for their diuretic effectiveness in relation to the corresponding incidence of gastrointestinal irritation. Ranked in terms of the arbitrary expression of this relationship, they showed improvement in practical utility from ammonium chloride with a value of 52 up to one of the most recently developed compounds, Neohydrin (3-chloromercuri-2-methoxy-propylurea),³ with a value of 284.

This then appears to be the present status of oral diuretic therapy. The range of its utility is a limited one. None is free of unpleasant gastrointestinal side-reactions. It is not possible with any of the orally administered materials to secure such diuretic effects as follow the intramuscular injection of meralluride or similar injectable mercurials in doses of the order of 2 cc without a prohibitive incidence of gastrointestinal distress. The results show that the average diuretic responses to most of the orally administered materials are in the range that would be represented by about 0.5 cc of meralluride by the intramuscular route.

COMMENTS

One may consider this situation as favorable or otherwise, depending on the point of view. If one expects from current oral diuretic therapy a substitute for injectable mercurial therapy, the current situation is very unfavorable. On the positive side, there is to be considered the fact that, while for a particular preparation diarrhea may develop in one-fourth or one-half of the patients, there are the patients in the remaining one-half or three-fourths of the group who tolerate it well and may even take larger doses with an adequate diuretic response. These patients are to be discovered only by the method of trial, and when they are found it is in them that the difficult problem of long periods of injections may be eliminated. Another favorable aspect of current oral diuretic therapy is the prospect of substantially prolonging the interval between injections by appropriate dosage with the orally administered materials, especially those with the more favorable ratio between diuretic response and local gastrointestinal irritation. There is need for having other diuretic agents intended for oral use examined in the same way.

In recent editorials,⁴ attention was called to the importance of clinical pharmacology in the evaluation of agents intended for therapeutic use. What has been described in this paper is an example of clinical pharmacology that provides the kind of information that should be obtained in connection with all new diuretic agents intended for the oral route before they are put to use in a more general test by the less controlled method of the so-called clinical trial.

Genes and Mermaids: Causation of Congenital Abnormalities.

—Some years ago, there came into my hands for dissection an abnormal fetus of nearly full term, of the very rare variety known as symphus dipus (with fused legs, showing elements of two fused feet), also called symmelus, or sirenomelus, and more usually a 'mermaid'. My search for the possible etiology of the condition has led me into many fields of study, from the folk-lore of antiquity down to modern investigations of morphogenesis, as I sought some reasonable explanation for the occurrence of gross abnormalities in general and of this one in particular. This search has so far led me to consider for the "mermaid" (really a "merman") the implications of the modern theory of the gene and its mutations as a possible basis of explanation: hence the title "Genes and Mermaids"—M F Hickey, M.D., *Genes and Mermaids: Changing Theories of Causation of Congenital Abnormalities*, *Medical Journal of Australia* May 9, 1953.

CLINICAL NOTES

TREATMENT OF PAROXYSMAL SUPRAVENTRICULAR TACHYCARDIA WITH METHOXAMINE

Alfred J. Berger, M.D.

and

Robert L. Rackliffe, M.D., New Britain, Conn.

We wish to call attention to the use of methoxamine hydrochloride (Vasoxyl)¹ in the treatment of paroxysmal supraventricular tachycardia. Not only is this drug effective in arresting the tachycardia, but, because of its powerful pressor action,² it is especially useful in cases complicated by vascular collapse, a frequent occurrence.³ The mechanism of action is believed to be a reflex vagal effect following carotid sinus pressure elevation. Two cases of paroxysmal supraventricular tachycardia complicated by vascular collapse, successfully treated by this agent, have been reported⁴ and two more are now added. The first case is one of nodal tachycardia and the second, one of auricular tachycardia.

REPORT OF CASES

CASE 1—C. M., a 63-year-old man, was admitted to the New Britain General Hospital on July 6, 1952, complaining of tachycardia of sudden onset, accompanied by dyspnea. He had previously experienced two similar attacks of tachycardia, the first occurring two years and the second 10 months prior to admission. These attacks had each lasted about three hours. One was terminated by carotid sinus pressure and the other ended in an unknown manner. Examination revealed a pulse rate of 160 beats per minute, with a regular rhythm. There was no cyanosis or peripheral edema. There were no murmurs or rales in either lung field. The blood pressure was 110/65. An electrocardiogram revealed nodal tachycardia with a rate of 160.

Carotid sinus pressure caused a slight slowing of the pulse rate, but the tachycardia was not stopped. Quinidine therapy was started at 2:30 p.m. of the day of admission, at which time 0.2 gm. was given. This was repeated at hourly intervals for four doses. One-half hour after the last dose, the patient complained of loss of sight and shortly thereafter became delirious.

and incontinent. Examination revealed the patient to be in a state of vascular collapse, with a blood pressure of 30/10 and a cold, clammy, cyanotic skin.

Methoxamine was given intravenously in a 20 mg. dose. Ten minutes later, the blood pressure was 50/30, the pulse rate was not recorded. Thirty minutes after administration of methoxamine, the pulse rate was 88 and the blood pressure was 80/50. During the next 12 hours, the pulse rate remained at about 85, and the blood pressure rose gradually, stabilizing at 120/90. An electrocardiogram revealed a normal sinus rhythm, with rate of 85. The patient was discharged on the second hospital day.

CASE 2—M. S., a 65-year-old woman, was admitted to the New Britain General Hospital on Aug. 30, 1952, because of acute glaucoma. A peripheral iridectomy was done at 2:35 p.m. on the day of admission. The patient had a 35-year history of attacks of tachycardia, which were characterized by sudden onset and spontaneous termination. The duration of the attacks was from several minutes to two hours, and they usually occurred several times each year. Results of examination of the heart and lungs were not remarkable.

On the evening of Aug. 31, 1952, the day after the iridectomy, the patient complained of palpitation, substernal pain, and dyspnea. Examination at 10:30 p.m. revealed the patient's skin to be cold and clammy, the blood pressure was 90/85. The apical rate was found to be 200 per minute, the rhythm was regular. There were rales at the bases of both lungs. An electrocardiogram at 10:45 p.m. revealed an auricular tachycardia with a rate of 206. At 11:30 p.m., after carotid sinus pressure and eyeball pressure proved ineffective, 10 mg. of methoxamine was administered intramuscularly. At the next examination at 11:45 p.m., the heart rate was 102 and the blood pressure 120/90. At 12 midnight, an electrocardiogram was taken, which showed a normal sinus rhythm with a rate of 102. The rales at the lung bases decreased gradually, disappearing completely one hour after the injection of methoxamine. There was no further tachycardia during the remainder of the patient's hospital stay.

COMMENT

The rapid and safe action of methoxamine contrasts with the effects of some of the previous methods of treatment. Carotid sinus pressure and other mechanical measures are often ineffective. Orally administered quinidine is slow to act, and intravenous administration of quinidine is attended by some danger. Procaine amide (Pronestyl) hydrochloride, like quinidine, is slow-acting when given by mouth and somewhat dangerous when given parenterally.⁵ Because of its myocardial depressant effect, caution is advised when it is used in patients with heart disease.⁶ The hazards of methacholine (Mecholyl) are well known, and neostigmine (used in combination with methacholine, because it was ineffective alone) has led to alarming reactions.⁷ Lanatoside C given intravenously is generally considered to be superior to quinidine in the treatment of supraventricular tachycardia.⁸ This superiority is due to its rapidity and safety. It would appear, however, that lanatoside C is not as rapid in action as methoxamine.

Methoxamine may have an almost immediate effect when given intravenously. In the two cases reported by Nathanson and Miller,⁴ the attack was said to have ended within a minute. The order of the rapidity with which methoxamine acts is apparently similar to that of phenylephrine (Neo-synephrine), which admittedly acts more rapidly than lanatoside C,⁸ restoring normal rhythm in from 35 to 70 seconds after rapid intravenous injection.⁹ Methoxamine is safe because it does not cause cardiac irritability. In this regard it is safer than phenylephrine,¹⁰ which, while terminating supraventricular tachycardia by a mechanism similar to that of methox-

amine, i.e., reflexly through the carotid sinus and vagus, tends to cause ventricular extrasystoles.⁹ Methoxamine is perhaps unique among pressor amines in not causing cardiac irritability. It has been found not to increase the irritability of the cyclopropane-sensitized heart, whereas epinephrine, arterenol, and numerous other pressor amines commonly produce either supraventricular or ventricular tachycardia.¹¹ Clinical tests by Nathanson and Miller⁴ provided further evidence that methoxamine does not cause cardiac irritability. They found that, when it was administered to six patients with heart block, it did not cause an increase in the ventricular rate. In contrast, epinephrine and to a lesser degree arterenol do cause an increase in ventricular rate in heart block.¹² They found also that methoxamine did not inhibit the production of cardiac standstill by carotid sinus pressure in six patients with sensitive carotid sinuses. In contrast, epinephrine consistently abolishes the ability of the sensitive carotid sinus to produce cardiac standstill. They also found that production of a tendency toward bradycardia is the characteristic effect of methoxamine on normal sinus rhythm.

SUMMARY AND CONCLUSIONS

Methoxamine, a powerful pressor drug, successfully ended attacks of supraventricular tachycardia complicated by vascular collapse in two patients. This drug is characterized by great rapidity of action, and it differs from many other pressor amines in that it does not cause cardiac irritability. If further experience confirms its safety, it may prove to be the drug of choice in the treatment of supraventricular tachycardia.

SUBACUTE THYROIDITIS TREATED WITH CORTISONE

Richard P Lasser, M D, Brooklyn

The clinical entity known variously as subacute nonsuppurative thyroiditis, deQuervain's disease,¹ or pseudotuberculous thyroiditis is characterized by a tender, firm, inflammatory enlargement of the thyroid gland resulting in (1) fever, (2) pain at the site of involvement and referred to either or both ears, (3) pain or difficulty in swallowing, (4) cough due to tracheal irritation, (5) a mildly hypermetabolic state, (6) marked elevation of the erythrocyte sedimentation rate, and (7) leukocytosis with polymorphonucleosis. This syndrome is readily recognizable and is entirely distinct, both clinically and pathologically, from other nonsuppurative thyroid conditions such as Riedel's struma and Hashimoto's disease.²

The cause of this inflammatory disease of the thyroid gland is not known, but it may be of viral origin. The pathological picture is that of intense inflammation with marked polymorphonuclear infiltration of the colloid follicles, forming what appear to be tiny milium abscesses or pseudotubercles. These have been so named because they appear as circularly arranged groups of foreign body giant cells. The disease may be mild and self-limited, responding adequately to bed rest and administration of iodides, or it may be severe, excruciatingly painful, and may result in persistent fever and disability. The excellent response to cortisone of a patient with subacute nonsuppurative thyroiditis is the subject of this report.

REPORT OF A CASE

A 33 year-old woman was admitted to the hospital on Aug 12 1952, with complaints of weakness, malaise, and pain in the left side of the neck for a period of one month. A low grade, variable fever had been observed during that time. Pain in the neck radiated to the head and to the inside of the left ear. The illness had not been preceded by any known upper respiratory infection, and the patient's history was noncontributory. The significant physical observations were obesity, temperature of 100.6 F, and moderate enlargement of the left lobe of the thyroid gland, which was firm and markedly tender. No enlarged cervical lymph nodes were palpated, and no signs of hyperthyroidism were observed. A diagnosis of subacute nonsuppurative thyroiditis was made. Laboratory studies showed an erythrocyte sedimentation rate of 82 mm in one hour, basal metabolic rate of -9%, hemoglobin level of 77% (12.3 gm [Sahli]), 4,010,000 erythrocytes, and 16,500 leukocytes, with 64% polymorphonuclears, 10% stab cells, 25% lymphocytes, and 1% monocytes. Serologic tests were negative, and blood sugar and blood urea nitrogen levels were within normal limits. No deviation of the esophagus was noted in barium studies.

Treatment consisted of bed rest, strong iodine (Lugol's) solution, 7 drops three times daily, aureomycin hydrochloride, 250 mg four times daily and analgesic agents for relief of pain. Rectal temperature remained about 100 F, but the patient felt somewhat better and asked to be discharged after five days of hospitalization. There was little change in the tenderness or size of the left lobe of the thyroid. One week later all medication was discontinued, and the patient returned to work. After three days the pain became severe. Both sides of the neck became extremely tender and painful, with pain radiating into both ears and to both sides of the head. Severe pain on swallowing was noted for the first time. The temperature rose to 102 F. The patient was readmitted to the hospital in acute distress. The entire thyroid gland, including the isthmus and pyramidal lobe, was markedly enlarged. Laboratory studies showed an erythrocyte sedimentation rate of 126 mm in one hour, a hemoglobin level of 70% (11.2 gm), 3,920,000 erythrocytes, and 19,000 leukocytes with 74% polymorphonuclear neutrophils, 6% stab cells, 18% lymphocytes, 1% monocytes, and 1% eosinophils.

Treatment again consisted of Lugol's solution, 7 drops three times daily, and aureomycin, 250 mg four times daily. Frequent injections of meperidine (Demerol) hydrochloride and oral administration of codeine were necessary but even these did not control the pain and discomfort. After two days, cortisone acetate in four divided doses totaling 100 mg daily was given by injection, and the patient was placed on a low sodium diet (less than 500 mg of salt daily). Diminution in pain and tenderness was observed after the first two injections of cortisone. Within 36 hours, virtually all tenderness had disappeared from the thyroid gland, and 24 hours later, the pain was entirely gone. A distinct decrease in the size of the gland was noted 48 hours after cortisone therapy was begun, and further rapid decrease was noted during the next five days. The temperature remained elevated for four days and thereafter returned to normal levels. Four days after institution of cortisone therapy the leukocyte count fell to 14,500 and one week later had

fallen to 12,500. The sedimentation rate remained high and declined slowly, so that after 12 days of cortisone therapy it was still 105 mm in one hour. After eight days of cortisone therapy, 100 mg per day, the dose was reduced to 50 mg daily in four divided doses. The pyramidal lobe again became tender and slightly enlarged. The dose was increased to 75 mg daily, and the symptoms subsided. The patient was then discharged from the hospital and maintained on orally administered cortisone, 75 mg daily in four divided doses. After another week (19 days of therapy), the sedimentation rate had fallen to 18 mm in one hour. Cortisone therapy, 50 mg daily, was continued for another week and then discontinued entirely. No further recrudescence of the thyroiditis was observed, and there was no return of pain, tenderness, or fever. When seen one month later, the patient had remained entirely well. The basal metabolic rate obtained at that time was -15%. There was still some residual enlargement of all lobes of the thyroid gland. Neither hyperthyroidism nor myxedema has so far been observed.

COMMENT

Cortisone may be expected to influence subacute non-suppurative thyroiditis favorably because of its action of suppressing inflammatory reactions, regardless of their cause. Cortisone provides a means of rapidly bringing the severe pain under control and of arresting the progress of this disease that presumably results from the presence of a marked inflammatory change in the thyroid gland and local structures. Cortisone may exercise a second therapeutic effect by depressing thyroidal activity, and it has been observed to depress the uptake of radioactive iodine³ by the thyroid gland. This seems to indicate that cortisone effects a reduction in hormone production and colloid formation. The use of cortisone in thyroiditis has already been reported by Crile,⁴ who noted a rapid reduction in the size of the gland and decrease in pain and tenderness. He stated, however, that recrudescence followed withdrawal of cortisone after short courses of therapy. It is possible that there was no recurrence in the case reported here because cortisone therapy was continued until after the sedimentation rate had returned to normal levels. This process did not occur rapidly, but required about three weeks' time. The return of the sedimentation rate to normal levels might be used as guide to cessation of cortisone therapy.

Other therapeutic measures, such as administration of Lugol's solution, penicillin, or other antibiotics, have not been conclusively shown to affect the course of this disease and did not do so in the present case. Radioactive iodine administration would not have been effective, because there is very little uptake by the gland during the inflammatory, acute phase of thyroiditis.⁵ Radiation therapy (600 to 700 r) has proved very useful but generally requires one to two weeks to reach full effect.⁶

A case has recently been reported in which thyroiditis developed while the patient was receiving cortisone

therapy for rheumatoid arthritis.⁷ However, in view of the fact that the thyroidal swelling became fluctuant and that the radioiodine uptake by the gland was 35%, it is probable that the condition was of a true suppurative or bacterial nature. The pathological process would then be entirely different from that of the case reported here.

SUMMARY

A patient with severe, febrile, painful, nonsuppurative subacute thyroiditis showed rapid remission of the symptoms and signs of the disease when treated with cortisone. Recrudescence did not occur when therapy was continued until after the sedimentation rate had returned to normal levels. Other therapeutic measures such as administration of strong iodine (Lugol's) solution, penicillin, and aureomycin did not appear to affect the course of the disease.

POISONING IN A CHILD SIMULATING DIABETIC COMA

REPORT OF A CASE

Henry Rascoff, M D

and

Seide Wasser, M D, Brooklyn

The clinical and laboratory picture resulting from the ingestion of poisons is often varied and bizarre. We have found no report in the literature, however, of a condition simulating diabetic coma that followed the swallowing of poisonous berries.

REPORT OF CASE

A 5-year-old white girl was admitted to the Beth El Hospital on Aug. 26, 1952, with the chief complaints of vomiting, abdominal pain, and fever. The child was apparently well until the night before admission, when she complained of pain in the abdomen and vomited. The temperature was normal. The next morning the pain became more intense and localized mostly about the umbilical region. The vomiting continued, and the vomitus was bile stained, the temperature rose to 102 F. A blood count and results of a urinalysis were found to be within normal limits. In the next few hours the child's general condition grew worse, and she was hospitalized.

The past history disclosed nothing remarkable. She had not suffered from any childhood diseases, a maternal grandfather had diabetes. The parents were questioned closely as to the possibility of the child having swallowed some poison, but they denied knowledge of any such act.

On admission, the picture presented was that of an acutely ill child who was semicomatose and had a temperature of 105 F. The pulse was rapid but regular, and the respirations were not labored. The skin was hot, dry, and free of any discoloration. The pupils were somewhat dilated but reacted to light. There was no neck rigidity, no abnormal reflexes were elicited. The heart and lungs were normal. There was some spasm and rigidity of the recti muscles, but no abdominal tenderness. A 5% solution of glucose in sodium chloride solution was given intravenously, but before this was done blood was drawn for chemical studies, and the child was catheterized for a urine specimen. The subsequent findings were revealing. The urine specimen was free of albumin but showed 4+ glucosuria and acetoneuria. The blood chemical findings disclosed a glucose

Mr. Landon Winchester, Botanist of the Brooklyn Botanical Gardens, identified the plant that had poisoned the child.

content of 290 mg per 100 cc and a carbon dioxide combining power of 14 vol %

After we received this report, our impression was that we were dealing with some overwhelming infection and diabetic coma. In view of the report that the urine was normal prior to hospitalization it was decided to withhold insulin therapy until further laboratory study. Intravenous administration of fluid in the form of 1/6 molar lactate and distilled water instead of glucose solution was begun. Antibiotic therapy was given, consisting of one million units of penicillin intramuscularly every three hours and 100 mg of oxytetracycline (Terramycin) in 50 cc of distilled water intravenously every four hours. Adrenal cortical extract was administered, with 10 cc. given initially and 5 cc every four hours.

At 8:20 that evening the temperature rose to 106 F, and the child began to have tonic and clonic convulsions. Phenobarbital was given intramuscularly to control the seizures. At 9:20 p.m. the blood glucose level fell to 210 mg per 100 cc, without insulin therapy, there was 3+ glucosuria, but the twitchings and seizures still persisted and the temperature remained high. A spinal tap done at this time revealed normal fluid content. After continuous antipyretic and hydrotherapy, the temperature fell to 103 F at midnight and the glucosuria was 2+. The convulsions were diminishing. At 6 a.m. the child called for its mother and began taking fluids by mouth. At 10 a.m. the temperature was 100.2 F, and the child sat up. The following day, 48 hours after admission the child was afebrile, and all the laboratory findings were within normal limits. The child was discharged on the fifth day of hospitalization.

One week after the child was discharged, we were notified by the mother that the child confessed to having eaten some berries picked off a bush in the park, just prior to the onset of the illness. A twig with some of the berries was submitted to the Brooklyn Botanical Garden for identification and was subsequently shown to be *Rhodotylos* of the *rosacea* family, a bush imported from Japan whose berries are called "jet beads."

These berries contain the glycoside amygdalin, which, when ingested, breaks down into hydrocyanic acid. Dr. John C. Krantz, professor of physiology of the University of Maryland Medical School, advanced a possible explanation of the clinical condition found in our case. He stated that "it was possible that this drug (hydrocyanic acid) has a centric action in the region of the hypothalamus and that as one has here a glycemic center as well as a heat center, each of these may have been effected by the drug, producing a hyperthermia and simultaneously contributing to the hyperglycemia."

COMMENT

It is difficult to estimate the actual number of accidental poisonings that occur in children, because as a rule only unusual or fatal cases are reported. Aikman¹ considers that the fatal cases alone amount to about 800 a year in the United States. Where the clinical picture is irregular and confusing and poisoning is suspected, the parents and other persons in close contact with the patient must be questioned closely. Although we did not elicit such a history, our clue that this might not be a true diabetic coma was suggested by the report of normal urine obtained several hours prior to admission. A public health question is also posed by this incident because of the evident availability to children of poisonous berries in city parks.

COUNCIL ON PHARMACY AND CHEMISTRY

REPORT TO THE COUNCIL

The Council has authorized publication of the following report from its Committee on Research

R. T. STORMONT, M.D., Secretary

The Committee on Research through its Subcommittee on Steroids and Cancer, is sponsoring a collaborative study on steroids and mammary cancer. Reports summarizing this work have been published (Estrogens and Androgens in Mammary Cancer: A Progress Report, report of the Council on Pharmacy and Chemistry, J. A. M. A. 140:1214 [Aug. 13] 1949; Proceedings of the First Conference on Steroid Hormones and Mammary Cancer, American Medical Association, Chicago, April 4-7, 1949; Current Status of Hormone Therapy of Advanced Mammary Cancer, report of the Council on Pharmacy and Chemistry, J. A. M. A. 146:471 [June 2] 1951). In the following report, the conclusions expressed are those of the authors, and final conclusions of the Subcommittee must await evaluation of the studies now in progress.

PAUL L. WERMER, M.D., Secretary

EFFECTS OF INTENSIVE SEX STEROID HORMONE THERAPY IN ADVANCED BREAST CANCER

B. J. Kennedy, M.D.

and

Ira T. Nathanson, M.D., Boston

Intensive therapy with estrogens and androgens is employed in the palliative treatment of advanced cancer of the breast.¹ Since observations of the systemic effects and complications of this therapy may provide a clue to the mode of action of the sex steroids in breast cancer, they may be important. Many effects of sex hormone therapy have been recorded, but additional manifestations not commonly recognized have become prominent and more frequently noted at the higher dosages usually employed in breast cancer. The purpose of this report is to record these reactions and their relative frequency with intensive and prolonged hormone therapy.

The duration of treatment varied from a few days to several years. Deleterious reactions occurred early in some patients, necessitating discontinuance of therapy. Thus, effects that might have occurred at later intervals could not be recorded. Most of the patients, however, were treated for a minimum of one month, and a large majority received continuous therapy for considerably longer periods. The causes of the shorter periods of observations were as follows: (1) development of later re-

SPECIFIC EFFECTS OF ANDROGENS

These data are based on an analysis of 82 consecutive female patients with advanced breast cancer who received 50 to 100 mg of testosterone propionate in oil, intramuscularly, three times weekly (table 1)

Hoarseness—Hoarseness, which was the commonest of the masculinizing phenomena resulting from androgen therapy, occurred in a minimum of 61% of the patients. The incidence increased with prolonged or more intensive therapy (fig 1). The changes varied from slight huskiness to a coarse, deep, masculine voice. Some patients complained of a persistent cold, sore throat, or rasping voice, others experienced constriction of the larynx and easy fatigability (or "cracking") of the voice. Singers found they could utter only discordant sounds. Apparently, these laryngeal changes are similar to those that develop in boys at puberty. Androgenic hormones produce hypertrophy of the vocal cords and, if continued, may lead to enlargement of the larynx.² Laryngoscopic examination of women in whom these changes develop reveals a generalized, suffused swelling, with injected blood vessels running the length of the cord. A pale, off-white color is a consistent feature of the late changes.³ Edema occurs first but hypertrophy of the muscle of the cord may result later. In the majority of our patients, discontinuation of the male hormone was usually followed by a gradual return of an essentially normal voice. In others, the voice failed to return to pretreatment quality, which undoubtedly resulted from persistence of the hypertrophy of the vocal cords.

Hirsutism—Hirsutism occurred in at least 52% of patients and was generally more noticeable in brunettes and in women with a tendency to hirsutism. The degree of hirsutism varied. With intensive and prolonged treatment, hirsutism usually increased and simulated a more typical masculine distribution (fig 1). Extreme hypertrichosis, characteristic of masculinizing tumors, was also observed. Variants in the sites of hair distribution were commonly seen. This raises the question of the receptor capacities of the end-organ. The presence of increased hair, especially on the face, disturbed many women and prompted measures for its removal. This induced-hypertrichosis, as a rule, gradually disappeared after cessation of therapy.

Alopecia—Partial loss of scalp hair, often associated with hypertrichosis elsewhere, was noted in 22% of the patients. The hair of the scalp became dry and coarse and fell out whenever it was combed. Recession at the temples was noted in some patients, and occasionally baldness of the vertex of the scalp resulted. When use of the hormone was stopped, hair reappeared in these areas. Although hair loss occurs in other debilitating diseases, these women generally felt well and maintained satisfactory nutritional states. Occasionally, the hair of patients who received large doses of androgens turned gray. It has been postulated that androgens produce alopecia primarily in persons who have a hereditary susceptibility to baldness. This was strikingly demonstrated in eunuchs who received androgen therapy.⁴ Queries of women in whom such changes developed revealed that their male predecessors had had a high incidence of spontaneous alopecia.

Dermatological Changes—Aesthetically distressing was the appearance of acne. The lesions resembled those seen in pubertal children and varied from small milia and scattered papules to extensive furuncles and papules over the face, back, and chest. Increased oiliness and thickening of the skin also were noted. Known effects of androgens have been suggested to explain the acne: an increase in sebaceous secretion and hyperplasia of the epithelial cells at the mouth of the hair follicle.⁵ With superimposed infection, papules and pustule formation may follow. The customary measures for skin hygiene were of benefit in the treatment of the acne, although cessation of therapy was usually followed by remission of this complication. In addition, women with brittle nails noted softening, increased flexibility, and a decrease in chipping. These effects were previously unobserved after prolonged androgen therapy but were confirmed on examination.

Ruddy Complexion—The complexion of patients treated over long periods frequently became ruddy and flushed, some times resembling the faces of patients with Cushing's disease. The face, anterior neck, chest, and occasionally the extremities became erythematous and blanched when pressed. The skin was usually warmer than normal, and patients complained of constant hot flushing unlike that of the menopause. Women who ordinarily had cold hands and feet were often relieved of this condition.

In a substantial number of patients with ruddiness of complexion, hemoglobin values rose from subnormal or normal levels to those as high as 19 gm per 100 cc. An elevation of the red blood cell count to 6 million cells and an increase

Fig 1—Incidence of side-effects of androgenic hormones with prolonged continuous therapy

in the hematocrit values accompanied the rise in hemoglobin. The mechanism of this hemopoietic stimulation by androgens is unexplained, but bone marrow studies of 12 patients revealed hyperplasia of the erythroid elements. The apparent increase in red blood cell volume or a vasomotor response may account for the flushing. Both ruddiness and flushing disappeared rapidly after omission of testosterone, but the hemoglobin level remained elevated for weeks.

Increased Weight and Well-Being—One of the most consistent effects observed was a feeling of well being, which was recorded in 76% of the cases. Patients depressed and debilitated by the disease often became euphoric. Well being appeared to be an effect of the androgen itself, irrespective of the course of the disease. This symptomatic response was very noticeable in some patients, despite progress of the can-

* Figures in this column represent those patients in whom positive or negative observations were recorded

cer. Patients frequently bedridden by pain and debility, particularly from osseous lesions, became rehabilitated. X-ray examination of these patients sometimes revealed actual progression of osteolytic lesions. This discrepancy between the subjective and objective responses, which occurred to a lesser degree in a fairly large percentage of patients, emphasizes the difficulties encountered in evaluating the response of the tumor when based on symptomatology alone.⁸ Occasionally relief of pain as a result of testosterone therapy was more satisfactory than that obtained from morphine, which suggested an analgesic action.⁷

Some patients gained so much weight that they became obese, dyspneic, and generally uncomfortable. At times, it was necessary to give these women a reducing diet during active androgen therapy. These effects can be partially explained by the anabolic capacities of the androgens, which may produce nitrogen retention and promote protein synthesis, with a resultant gain in body weight and increase in muscle tone. Fluid retention in some patients, which may be an accompaniment of androgen therapy without evidence of edema, can account for small weight gains as explained later.

Increased Libido—After some months of androgen therapy, 37% of the patients noted an increase in libido, the incidence increased with prolonged therapy (fig 1). This may not represent the true incidence, since some patients were reluctant to discuss it even during direct questioning. The sensation was expressed as a heavy feeling in the pelvis, an increase in the frequency of the sexual act, or a loss of previous frigidity. The degree of accentuation of these sexual impulses varied. Married women were emotionally less disturbed than widows or spinsters. Some found the change so unpleasant that use of the hormone was discontinued. A relatively prompt disappearance of the symptoms usually followed within a short time. This is in accord with previous studies, indicating that androgens cause an increased susceptibility to psycho-

sexual stimulation, enlargement of the clitoris, increased sensitivity of the external genitalia, and a greater intensity of sexual gratification.⁸ The clitoris of each patient was not examined systematically, but cursory observations revealed definite enlargement in a number of patients during androgen therapy. An incidence of 28% was reported.⁹ The increased feeling of well being and improvement of the breast cancer might possibly have contributed to this libido-inciting effect.

Drowsiness, Nausea and Vomiting—A few patients noted headaches, drowsiness, nausea, and vomiting of brief duration at the beginning of androgen therapy, apparently unassociated with hypercalcemia. Serum calcium determinations were normal. These effects seemed to be produced by other reactions of the hormone, although the presence of incipient or transient hypercalcemia must be considered when they occur. In no patient were these symptoms severe enough to necessitate discontinuance of therapy.

SPECIFIC EFFECTS OF ESTROGENS

Data were available for analysis of the effects of estrogens in 235 cases (table 2). Diethylstilbestrol was used as the reference standard in 178 patients. The usual dosage was 15 mg per day orally, but variations from 5 to 400 mg daily were used. Equivalent dosages of other natural and synthetic estrogenic hormones were employed. All but 20 patients included in the analysis received continuous treatment for at least one month and several for more than one year. The remaining patients discontinued the medication early because of severe anorexia, nausea, and vomiting.

Gastrointestinal Symptoms—Anorexia, nausea, and vomiting, the commonest gastrointestinal symptoms, were fleeting at the start of therapy but persisted in some patients. Of 235 patients, 58% had variable degrees of nausea, and vomiting occurred in 32%. With careful attention to the management of these symptoms and adjustment of dosage, the patient usually became tolerant to more intensive and prolonged therapy. If the patient became severely nauseated by the initial dosage, the daily dose of the hormone was decreased or administered only at bedtime. Gradually the dose was increased as tolerated, until the desired dosage could be administered. Occasionally, despite all efforts, patients were unable to accept the standard dose of the initial estrogen but could tolerate smaller amounts or another estrogenic preparation. This latter

Fig 2.—Incidence of gastrointestinal symptoms caused by estrogens with respect to increasing age.

phenomenon needs clarification. A small percentage of patients were unable to tolerate estrogenic hormones of any kind at any dosage. The incidence and degree of gastrointestinal symptoms decreased with advancing years (fig 2). The usual measures to combat nausea and vomiting have seldom been of value in the management of patients treated with estrogen. Patients who tolerated an initial course of estrogens sometimes experienced nausea and vomiting during interrupted courses of the hormone or, occasionally, later during continu-

ous treatment. In a few patients, epigastric pains of short duration were noted. In others, soft or increased frequency of bowel movements or diarrhea occurred, but rarely were these symptoms severe enough to warrant treatment or discontinuance of the hormone.

Dermatological Changes—In elderly women with dry, coarse, atrophic skin, occasionally increased tissue turgor and softening of the skin developed after prolonged estrogen

Fig 3—Appearance of areola, nipple and axilla. A, prior to estrogen therapy; B, after four months of estrogen therapy. Note the stippled appearance of the pigmentation in linear folds of the axilla.

therapy. A few patients noted flushing of the face, which was seen frequently after administration of testosterone. Itching occurred in a few persons. Rarely, skin lesions consisting of diffuse areas of small papules or erythema were noted.

Pigmentation—Pigmentation of the nipples was present in about 80% of the women treated with estrogenic hormones. The earliest and sometimes the only change was a redness of the nipple and areola, particularly in patients who did not have previous pigmentation (fig 3). True pigmentation varied from a faint to a deep brown, frequently covered by a thick, dark, waxy coating. Removal of this waxy substance revealed definite pigmentation beneath it. The pigmentation, sometimes limited to the nipple, usually involved the areola.

Fig 4—Incidence of pigmentation with prolonged estrogen therapy.

and was sharply demarcated at the border. As a rule, the pigment persisted as long as the hormone was administered, although occasionally the color became less intense. After cessation of therapy the pigmentation persisted in some patients for many months. X-ray treatment to the areolar areas usually prevented the formation of pigmentation or destroyed that already present.

During the study, some patients complained that the axilla could not be cleansed. The pigmentation was stippled and was diffuse or confined about the hair follicles in the linear folds

(fig 3). Approximately two-fifths of the patients in this series had axillary pigmentation. The incidence was probably larger, since this aspect was not specifically observed early in the studies. Prolonged estrogen therapy is usually associated with an increased incidence of pigmentation (fig 4). Pigmentation also occurred in scars as well as in those areas usually affected during pregnancy. Pigmentation was noted in the labia, around or in the umbilicus, and in the linea alba. More recently, pigmentation of the linear lines of the anterior cervical region has been noted. Pigmentation of the buccal mucosa or palms was not seen.

Breast Alterations—The clinically detectable response of the uninvolved breast tissue to estrogens varied, but it appeared to be governed, to some extent, by the age and menstrual status of the patient. Such signs as tingling or tenderness of the nipples, engorgement, or venous dilatation appeared. Although the group of patients was heterogeneous, about 20% of the entire group exhibited these signs. The changes were confined mostly to premenopausal and menopausal women. Clinical alterations in elderly women, except for pigmentary changes, were considerably less detectable (fig 5). This implies that the atrophic breast tissue of the postmenopausal and aged woman is not capable of response to the stimuli provided in the prime of menstrual life.

Histological changes may occur without clinical signs, but ordinarily they accompany the overt manifestations.¹⁰ It is quite possible that the status of the breast tissue at the be-

Fig 5—Incidence of breast engorgement from estrogen therapy in women with metastatic carcinoma of the breast.

ginning of estrogen therapy may be a determining factor in the responsiveness of the tumor.

Uterine Bleeding—In contrast to the breast, the postmenopausal endometrium seems to be more sensitive to the action of estrogens regardless of the age of the patient. The latter, however, appears to be a factor in the responsiveness. Large dosages of estrogens produce amenorrhea in premenopausal women with breast cancer, which agrees with observations made in the treatment of patients with other abnormalities.¹¹ This is thought to be partially accomplished by inhibition of pituitary gonadotropins, but estrogens may also act directly on the endometrium. These and other studies reveal that intensive estrogen therapy may exhaust the endometrium in its capacity to respond. Continuous and intensive estrogen therapy in postmenopausal patients with breast cancer resulted in uterine bleeding in about one-third of the patients during therapy. The signs consisted of spotting or staining for brief intervals or a flow simulating a normal menstrual period. Generally, no measures were required for control of the bleeding except cessation of the hormone. In some cases, uterine bleeding could also be controlled by sharply increasing the dose of the estrogen. Occasionally, bleeding was sufficiently severe and prolonged to require curettage; the endometria of the patients subjected to this procedure usually revealed hyperplastic changes. (Prolonged bleeding should lead to the suspicion of stimulated fibroids or cancer of the endometrium.) In younger postmenopausal patients, the bleeding occurred frequently during therapy and almost invariably happened

after treatment was withdrawn. Contrariwise, in elderly women with presumably atrophic endometriums, bleeding was encountered less often during therapy and after withdrawal of therapy. In this latter group, resumption of estrogen therapy resulted in the pattern commonly seen in younger women, for bleeding occurred during the therapy as well as after cessation of the hormone. The incidence of uterine bleeding increased with prolongation of therapy (fig 6).

These observations prompt the following suggestions: 1 The endometrium, even though apparently atrophic, is sensitive to estrogens many years after the menopause. 2 Once an atrophic endometrium is primed, it responds differently, behaving like that of women in the immediate postmenopausal phase. Generally, however, the incidence of uterine bleeding decreases in successive years after the menopause, both during therapy or after withdrawal (fig 7). This raises the question of receptivity of the endometrium, which involves blood supply and cellular responsiveness.

Urinary Urgency and Incontinence—Another effect of large doses of estrogens is frequency and urgency of urination. The urgency of urination is frequently associated with urinary incontinence, usually of the stress type. This was not recognized early in the study because of reluctance of the patients to discuss it. So distressing was the urgency and incontinence that many patients wished to discontinue the medication. Omission of the estrogen was followed by prompt disappearance

Fig 6—Incidence of uterine bleeding after prolonged estrogen therapy

ance of these symptoms. These urinary symptoms occurred primarily in older women who had borne children. Although the mechanism is not understood, estrogens may affect the sphincter and bladder musculature.

Miscellaneous Effects—Early in the course of therapy, a few of the patients experienced headaches and dizziness. These symptoms were present in patients receiving larger dosages of estrogens than those usually employed in this program. Cerebral edema might possibly account for these effects. Among other symptoms were drowsiness, 'jumpiness,' apprehension, lack of pep, depression, and weakness; these disappeared after treatment was omitted. Increase of libido was reported in a very small percentage of patients.

Occasionally, glossitis, consisting of a bright red, smooth tongue resembling that caused by vitamin B deficiency, developed in patients receiving estrogens. These patients were on a diet apparently adequate in vitamin B complex, but it is possible that the estrogens increase the demand for or suppress the utilization of vitamin B.¹¹ Improvement followed supplementary vitamin therapy.

Four patients who received estrogens for more than one year had polydipsia and polyuria. Two of these who drank large quantities of fluid a day demonstrated positive tests for diabetes insipidus. Although this disease may possibly be caused by metastases, there was no evidence of this in two patients at autopsy. It can be postulated that the prolonged administration of estrogen may alter the secretion of the posterior pituitary gland.

EFFECTS COMMON TO BOTH ANDROGENS AND ESTROGENS

Extracellular Fluid Retention—It has been demonstrated that androgens and estrogens produce a decreased excretion and an increased retention of sodium, with a corresponding increase in extracellular fluids.¹² Short-term pilot studies with radioactive sodium in a number of patients revealed an increase in sodium space.

Fig 7—Incidence of uterine bleeding with respect to age during intensive estrogen therapy and after withdrawal of the hormone

Early in the course of estrogen or androgen therapy, mild edema, which subsided spontaneously, developed in many patients. Prolonged hormone therapy produced no increase in the incidence of edema, however, a greater incidence of edema was noted in older women, possibly because the cardiovascular system of such patients is less able to cope with the burden of excessive retention of fluid (fig 8). In the patients treated with massive doses of testosterone, edema of the legs was noted in about one sixth of the cases. Prolonged estrogen therapy produced peripheral edema in one third of the patients.

Fig 8—Incidence of edema during intensive hormone therapy in women with advanced carcinoma of the breast

The degree varied from minimal late afternoon swelling to constant edema of the entire legs. Many patients undoubtedly had retention of fluid that could not be detected on clinical examination, because weight gains of 5 to 10 lb (2.3 to 4.5 kg) were recorded without gross evidence of edema. Discontinuance of the hormone in a number of patients of this group was usually followed by an obvious diuresis and rapid decrease in weight. These patients did not manifest any renal disease before therapy, as judged by routine urinalyses.

or serum nonprotein nitrogen determinations Existing lymphedema of the arm on the affected side was frequently exaggerated during steroid therapy

In 17 patients (9%) of those receiving estrogen therapy, fluid retention led to congestive cardiac failure or exaggerated an existing mild decompensation Five patients who had edema during estrogen therapy died of congestive heart failure at home, according to the family physicians, however, the investigators had not observed any evidence of this condition a short time previously The breast disease did not appear sufficiently far advanced to cause death Thus, the incidence of death apparently resulting from congestive failure was recorded as 2.6% Four cases of acute congestive failure have been reported in men treated with diethylstilbestrol for advanced cancer of the prostate gland Three of these patients had possible preexisting myocardial damage¹⁰ Testosterone led to congestive failure in only one member of the present series

Thrombophlebitis of the lower extremities, which was often unilateral, was prone to occur in women in whom edema

developed It is our impression that this complication happened more frequently than could be expected by chance Edema, superimposed on poor peripheral circulation, may be an important factor influencing the start of this complication

Although fluid retention is a serious sequela of androgenic and estrogenic therapy, employment of specific measures will usually control or minimize this complication and in many instances enable continuance of hormone therapy As a rule, the use of ammonium chloride and a low salt diet are sufficient If these measures are inadequate, mercurial diuretics can usually correct the situation Preexisting cardiac failure should be treated before the initiation of hormone therapy In anticipation of possible fluid retention from steroids, it was our policy to include ammonium chloride and a low sodium intake as a part of the therapeutic regimen in elderly patients or those with known cardiac disease

Hypercalcemia—Hypercalcemia may occur with either androgens or estrogens during treatment of advanced breast cancer with osseous involvement¹³ On the basis of blood studies, it was determined that hypercalcemia occurs spontaneously in about 12% of breast cancer patients with osseous metastases^{12c} The number of cases induced by steroid hormones probably is less, but the syndrome is more serious and may be

fatal Spontaneous hypercalcemia may be corrected by steroids, so it does not contraindicate therapy, providing the patient is carefully observed, however, steroid hormones may also induce the syndrome in patients in whom there was no detectable evidence prior to the initiation of therapy Hypercalcemia was observed in seven (9.6%) of the patients receiving androgenic hormones Three of these died, apparently as a result of this complication Hypercalcemia from estrogen therapy was rare in this series, occurring in only two of the total number of patients Manifestations of hypercalcemia were anorexia, nausea, vomiting, apathy, weakness, drowsiness sometimes merging into disorientation, stupor, or coma, vascular collapse, and, in some instances, death Although the initial symptoms may be subtle, the syndrome must be suspected in any patient who exhibits these mild symptoms Serum calcium determinations should be performed at the beginning of and during therapy, especially if suggestive symptoms arise In addition, the more rapid and simpler estimation of urinary calcium is often informative Ideally, both assays are desirable Clinical and laboratory evidence of uremia was present in four of the patients with hypercalcemia who were receiving testosterone The hypercalciuria apparently produces damage of the renal tubules, with resultant renal insufficiency Postmortem examination may reveal deposition of calcium in the tubules as well as in other tissues¹⁴

The syndrome of hypercalcemia may be corrected, in many instances, by cessation of hormonal therapy, low calcium diet, and infusions of sodium chloride, glucose, and sodium citrate. A 25% solution of sodium citrate can be administered in an amount of 250 cc intravenously every four hours until improvement occurs Sodium citrate temporarily reduces the amount of ionized calcium in the blood caused by the formation of a soluble, nonionized calcium citrate complex¹⁵ However, we believe that correcting the abnormal electrolytic pattern in these patients is most important in treating this serious complication When drug induced hypercalcemia is corrected, further steroid therapy may be tried cautiously The syndrome may recur, but some patients encountered no further difficulty and greatly benefited from the therapy

Temporary hypercalcemia might have been present in patients noting drowsiness and nausea at the start of therapy, but it was undetected The incidence of death resulting from hypercalcemia might possibly be reduced by more frequent serum calcium and nonprotein nitrogen determinations and close observation of the patient for early detection of this complication

Amenorrhea—Cessation of menstruation is common in women without cancer during treatment with high doses of androgens and estrogens^{5a} Such therapy may produce permanent amenorrhea in women passing through the menopause Amenorrhea also occurs in menstruating women with disseminated breast cancer who are receiving androgens or estrogens Of the premenopausal women receiving large doses of estrogenic hormones, 87.5% experienced amenorrhea during this therapy The hormone-produced amenorrhea can be attributed to suppression of gonadotropic activity, especially since patients resume menstruation after cessation of therapy¹⁶

COMPARISON OF NATURAL AND SYNTHETIC ESTROGENS

During the investigation of estrogen therapy in advanced breast carcinoma, both naturally derived and synthetic preparations were employed, in an attempt to evaluate the effectiveness of each The commonly employed compounds, the average dosages, and the incidence of local and systemic reactions of cases in which synthetic estrogens were used are recorded in table 3 Since these data were compiled, the number of patients treated with compounds other than diethylstilbestrol has substantially increased, however, the relative incidence of reactions has not been altered significantly At present, the data are insufficient to determine whether any single agent uniformly produces fewer reactions than any other Further studies with various dosages are necessary to determine the relative incidence of side-effects at each level No attempt has been made in this report to correlate the various compounds or the systemic reactions with the response of the tumors The combined use of estrogens and androgens has been tried in a number of patients, but the data are too

few for critical evaluation, especially in respect to effects that are common to both groups of compounds. It appears, however, that more specific sex changes, usually attributed to typical estrogens and androgens, may be minimized with such a combination.

ESTROGENS IN MEN

Large doses of estrogenic hormones have been employed in the treatment of advanced breast cancer in men. Since the series is small, no statistical analysis was attempted. The reactions, which appear similar to those noted in the treatment of prostatic carcinoma, include anorexia, nausea, vomiting, nipple and areolar pigmentation, tenderness and hyperplasia of the uninvolved breast tissue, extracellular fluid retention, and loss of libido; hypercalcemia has not been observed.

SUMMARY AND CONCLUSIONS

Systemic and local reactions were studied in patients with breast cancer receiving intensive sex hormone therapy. A large variety of reactions occurred, which were not specifically related to the action of the hormone on the tumor but could be attributed to inherent qualities of the compounds. This was particularly true when larger dosages were used; they apparently caused a higher incidence of reactions than doses employed in other syndromes. Moreover, at these dose levels, reactions occurred that are not universally recognized.

Further study of the reactions discussed in this report may disclose additional information as to the physiological action of the sex hormones and an explanation of their mechanisms in the treatment of advanced breast carcinoma. Tabulation of the reactions may also contribute to an evaluation of sex steroid hormone therapy in general.

COMMITTEE ON COSMETICS

The following products have been accepted as conforming to the Rules of the Committee on Cosmetics. A copy of the rules on which the Committee bases its action will be sent on application.

R T STORMONT, MD, Secretary

Athea Laboratories, Inc.

ATHEA HAND LOTION—A white emulsion composed of lanolin, petrolatum, a vegetable oil, stearic acid, hexadecanol, magnesium stearate, propylene glycol, cetyl alcohol, and perfume intended to soften and protect the skin. (Bottle 4 and 8 oz. and 1 gal.)

Cosmetic Laboratories, Inc.

BODY LO—A white emulsion composed of liquid petrolatum, polyol esters, a preservative, perfume, color, and water intended to soften and protect the skin. (Bottle ¼ 3 and 8 fl. oz.)

HAND-LO—A pink emulsion composed of triethanolamine, colloidal clay, fatty acids, and esters, petrolatum, lanolin, alcohol, a preservative, perfume, color, and water intended to soften and protect the skin. (Bottle ¼ ½ 1 2 3 and 8 fl. oz.)

HOMOGENIZED SKIN CLEANSER—A pale yellow heavy cream composed of lanolin, a polyol ester, petrolatum, a wax, magnesium sulfate, a preservative, perfume, and water intended to cleanse the skin. (Jar 1½ 3¼ 8½ and 16 oz.)

PROTECTION (OILY, NORMAL AND DRY)—A white emulsion composed of vegetable gums, petrolatum, waxes, soap, borates, benzoic acid, propylene glycol, and its stearate, a preservative, perfume, color, and water. The ingredients are the same in each of the three forms. The ratio of the ingredients and the perfume content differs in each type. They are intended to keep the skin soft and smooth and to serve as a powder base. (Bottle 2 3 and 8 fl. oz.)

Luzier's Inc.

LUZIER'S LIQUID MAKE UP BASE—A pigmented liquid containing glycerin, a fatty acid, and its glyceryl and polyethylene glycol esters, an alcohol, a petrolatum, triethanolamine, a surface active agent, a preservative, water, and colors intended to serve as a make-up to provide color to the skin and a smooth appearance. (Bottle 1 fl. oz.)

Pharma-Craft Corporation

FRESH CREAM DEODORANT—A white cream composed of basic aluminum formate, aluminum chloride, urea, petrolatum, glycerin, a fatty acid, and its glyceryl ester, a suspending agent, perfume, and water intended to temporarily retard the flow of perspiration. (Jar 0.16 0.42 0.75 and 1.20 oz.)

HEED DEODORANT SPRAY—A clear, colorless solution composed of an aluminum chlorhydroxide complex, aluminum chloride, urea, perfume, and water intended to temporarily retard the flow of perspiration. (Plastic Bottle 1.20 fl. oz.)

SPRITE SPRAY DEODORANT—A clear, colorless solution composed of an aluminum chlorhydroxide complex, aluminum chloride, urea, alcohol, perfume, and water intended to temporarily retard the flow of perspiration. (Plastic Bottle 1.5 fl. oz.)

Revlon Products Corporation

AQUAMARINE HAND CREAM—An aquamarine-colored cream emulsion composed of lecithin, stearic acid, a glycol, glycol ethers, and esters, inorganic alkali, a preservative, perfume, color, and water intended to soften and protect the skin. (Jar ¾ oz. and 1 lb.)

AQUAMARINE LOTION DEODORANT—An aquamarine cream emulsion composed of polyoxyethylene ethers and esters, cetyl alcohol, cholesterol, absorption bases, fatty acid amide derivative, aluminum chlorhydrate, a buffer, a preservative, perfume, color, and water intended to temporarily retard the flow of perspiration. (Bottle 2¾ fl. oz.)

AQUAMARINE MIST—An amber-colored solution of essential oils, alcohol, color, and water intended to provide a pleasing scent. (Bottle 3.12 and 7 fl. oz.)

CAKE ROUGE—A pigmented cake powder composed of a mixture of talc, glycerin, tragacanth, covering agents, a preservative, perfume, and colors intended to enhance the color of the cheeks. (Cake 7.8 gm.)

CHEEKSTICK—A pigmented waxy solid in stick form composed of petrolatum, lanolin, a wax, a covering agent, a preservative, perfume, and colors intended to enhance the color of the cheeks. (Stick 2.6 gm.)

CUTICLE OIL—A rose-colored solution composed of petrolatum, color, and perfume intended to soften the cuticle. (Bottle 1 and 4 fl. oz.)

CUTICLE REMOVER—An off white solution of a polyethoxy ether, a substituted ammonium hydroxide, propylene glycol, a preservative, a color, and water intended to soften the cuticle and permit its removal by gentle friction. (Bottle 1.4 and 16 fl. oz.)

DESTINA MAKE UP REMOVER—A clear green solution composed of a polyoxyethylene ester, alcohol, glycerin, perfume, colors, and water intended to facilitate the removal of make-up. (Bottle 4 fl. oz. and qt.)

EYEBROW PENCIL—A pigmented waxy solid composed of fatty acids, lanolin, waxes, a vegetable oil, glycerides, a resin, and colors intended to enhance the color of the eyebrows. (Pencil 1½ in. by 0.115 to 0.120 in.)

HAND COLOGNE—A clear pink solution composed of alcohol, polyethylene glycols, perfume, colors, and water intended to provide a pleasing scent. (Bottle 4 and 16 oz.)

INDELIBLE CREAM LIPSTICK—A waxy solid stick composed of waxes, glycol, and a glycol ester, vegetable oils, a cholesterol, absorption base, a covering agent, a preservative, perfume, and colors intended to enhance the color of the lips. (Tube 4.5 gm.)

NAIL CREAM—A pink cream composed of lanolin, petrolatum, a sorbitan ester, a wax, a covering agent, perfume, color, and water intended to soften the cuticle. (Jar ½ and 2 oz.)

NIGHT HAND CREAM—A thick pink cream composed of petrolatum, lanolin, a cholesterol, absorption base, a preservative, perfume, colors, and water intended to soften and protect the skin. (Jar 2¼ oz.)

PASTE POLISH—A pink cream composed of a wax, a phthalate ester, lecithin, covering agents, perfume, and color intended to add gloss to the nails. (Jar 0.95 oz.)

PINK LACTOL—A thick pink cream lotion composed of a fatty acid and its ester, alcohols, triethanolamine, lanolin, preservatives, perfume, colors, and water intended to soften and protect the skin. (Bottle 32 and 128 fl. oz.)

TOUCH AND GLOW—A pigmented liquid composed of stearic acid and its glycol ester, cholesterol, bases, lecithin, covering and thickening agents, triethanolamine, a glycol, preservatives, perfume, colors, and water intended to serve as make-up to provide color to the skin and a smooth appearance. (Bottle 1 and 2 fl. oz.)

Shepard Laboratories

SHEPARD'S CREAM LOTION—A white emulsion composed of glycerin, a fatty acid, and its glyceryl ester, triethanolamine, cetyl alcohol, preservatives, propylene glycol, carbital, alcohol, sesame oil, perfume, and water intended to soften and protect the skin. (Bottle 8 fl. oz.)

SHEPARD'S COLD CREAM—A white heavy cream composed of waxes, petrolatum, a glyceryl ester, cetyl alcohol, a preservative, sodium borate, perfume, and water intended to cleanse the skin. (Jar 3½ oz.)

SHEPARD'S DRY SKIN CREAM—A yellow cream composed of a wax, lanolin, petrolatum, and perfume intended to relieve skin dryness. (Jar 1½ oz.)

Toni Company

TONI HOME PERMANENT (VERY GENTLE, REGULAR AND SUPER)—A creamy solution consisting of ammonium thioglycolate, free ammonia, ammonium salts, an emollient, creaming agent, a surface active agent, perfume, color, and water. This is provided in three strengths, very gentle, regular, and super, intended for easy to wave, normal, and hard-to-wave hair, respectively. This is a cold waving solution intended to be used with a chemical neutralizer. (Waving Lotion 4 fl. oz.)

FROM HOME PERMANENT (VERY GENTLE, REGULAR AND SUPER)—A creamy solution consisting of ammonium thioglycolate, free ammonia, ammonium salts, an emollient, creaming agent, a surface active agent, perfume, color, and water. This is provided in three strengths, very gentle, regular, and super, intended for easy-to-wave, normal, and hard-to-wave hair, respectively. This is a cold waving solution intended to be used without a chemical neutralizer. (Waving Lotion 4 fl. oz.)

WATCH IT, *LIFE*

Physicians read with amazement and resentment the recent editorial, "Watch It, Doc," which appeared in the June 22, 1953, issue of *Life* magazine

The editorial condemned the action of the House of Delegates of the American Medical Association for adopting a resolution presented by delegates of the Indiana State Medical Association pertaining to the care of crippled children

It is unfortunate that *Life's* editors apparently took neither the time nor the trouble to investigate the facts before sounding off on a subject so close to the hearts of millions of its readers

Indiana was the first state to tell Washington to keep its general welfare money, pledging to carry on its own program without a 20 million dollar federal handout. This was brought about by the action of the state legislature in passing an antisecrecy clause to reduce the rapidly rising cost of welfare in Indiana by opening the reports of the state's department of welfare to public view. This movement spread rapidly throughout the country, and it took an act of Congress to protect the various states from reprisals by the Federal Security Agency, which was then headed by Oscar Ewing

The editorial gave a distorted picture not only of the position of the A M A House of Delegates but also of the actions of the New York County Medical Society concerning the extension of medical care to a housing project proposed by the New York State Housing Commissioner. Judging from the reference to the medical care housing controversy, *Life's* writer must have been content to use only newspaper clippings and secondhand sources of information

Life has violated one of the cardinal principles of good journalism—the accurate reporting of facts. The New York County Medical Society said in a letter to *Life's* chief editorial writer

"*Life* repeated—with damaging effect—a quotation attributed to our chairman of the Committee of Medical Economics, which first appeared in the *New York Times* on April 7, 1953, about giving the patients 'breakfast in bed.' This was categorically denied to the *New York Times* on the same date but your writer, using only newspaper clips and not coming to the Society for his information, repeated the libelous phraseology and compounded it by going on to comment about Marie Antoinette and 'let them eat cake.'"

If *Life* had taken the time New York and other newspapers did to check the facts behind the crippled children's resolution, an entirely different picture would have been unfolded. The facts underlying introduction of the resolution before the A M A House of Delegates and the subsequent action by the House are in keeping with the demand of the public for a sensible form of government administration of various assistance programs. The resolution pertained to a regulation adopted by the Federal Security Agency in 1944 under Paul V. McNutt, Federal Security Agency Administrator, which reads

"Section 200.9 of Part 12-4 of Regulations for Maternal and Child Health and Crippled Children's Program, entitled 'Crippled Children's Programs Diagnostic Services'

"State plans for Crippled Children's Services shall provide that the diagnostic services under the plan will be made available within the area served by each diagnostic center to any child (a) without charge, (b) without restriction or requirement as to the economic status of such child's family or relatives or their legal residence, and (c) without any requirement for the referral of such child by any individual or agency."

Before a state can obtain federal approval for its crippled children's program it must adopt this regulation or at least the sense of it. States are compelled to renew the crippled children's pledge set forth in the Federal Security Agency regulation every two years. With a change of administration in Indiana, a new welfare board was confronted with accepting the provisions by July 1, 1953, or failing to have the welfare program approved under the law. Eventually, Indiana's welfare board, under coercion, reluctantly approved the regulation for a two year period, but lodged a vigorous protest with Washington, saying the approval was being given under protest.

Life never touched on this background, nor does it appear to have consulted the Indiana Department of Public Welfare, which recently reported that the state's crippled children's program was costing the taxpayers almost nothing—thanks to a long-time arrangement with Indiana physicians who contribute their professional services. To *Life*, this apparently means nothing. Had the magazine checked its facts, it would have learned that Indiana's director of the crippled children's program recently praised physicians of that state for willingly treating deserving crippled children on other than a fee-for-service basis.

Life could have learned, too, if it had taken the time, that Indiana taxpayers are paying the physicians in the program an honorarium averaging only \$40 per month or \$480 per year for all professional services to crippled children in the state. For this amount, which totals less than \$10,000 per year, the children receive professional services that would cost more than \$100,000 per year on a fee-for-service basis, according to the state's welfare department.

In reporting for the year 1952, the Indiana Department of Public Welfare's figures show that during the calendar years, Indiana physicians treated 2,844 children in clinic and made a total of 9,354 visits. In addition, 655 children received a total of 15,857 days of

corrective hospital care by physicians, or an average of 24 days per child, for which the physicians received no extra pay for visits or services. Another 2,517 children received auxiliary orthopedic and therapy services in their home communities as a follow-up precaution to make sure that each child was being properly rehabilitated.

Such services to crippled children are not given in Indiana alone. Every Shriner hospital ward, orthopedic hospital, county hospital, and private hospital can certify to similar charitable services by physicians in every state in the union. It has never been the intent of the medical profession to remove the availability of medical care from those who are in need of care and unable to pay.

In introducing the resolution to the A M A House of Delegates, Indiana physicians believed honestly and sincerely that whenever any law or regulation provides free service for all, regardless of economic status, and whenever the responsibility of control is removed from a state or local agency charged with the responsibility of administering and paying for the services performed, it definitely is a socialistic program.

It is significant that *Life* chose to ignore all the other resolutions acted on by the House of Delegates—many of them dealing with constructive and positive aspects of the American Medical Association's program—and elected to concentrate on one to which wide interpretation and speculation could be given. As Dr. Louis H. Bauer said in a letter to *Life*: "You took one resolution adopted by the House of Delegates and distorted the action of the House." He charged the magazine with exhibiting "either woeful ignorance or an unwillingness to accept fact."

Magazines and newspapers have ethics the same as the medical profession. In reporting on the A M A action, *Life* threw the fundamental canons of journalism—sincerity, truthfulness, and accuracy—out the window. In doing so, *Life* betrayed not only the physicians of this country but also its big family of readers. Good faith with the reader is a paramount principle. By every consideration of good faith, a magazine is constrained to be truthful. It is not to be excused for lack of thoroughness or accuracy within its control. So, in reply to *Life's* "Watch It, Doc," one can say "Watch It, *Life*."

REDUCTION OF MOTOR VEHICLE DEATHS AN INDIVIDUAL RESPONSIBILITY

A total of 262 persons lost their lives in motor vehicle accidents in the United States during the Fourth of July weekend this year. Most of these lives were lost needlessly. It is ironic that with the millions of dollars and thousands of man-hours spent for medical research to prolong human life each year, almost a million persons sacrifice their lives and limbs through carelessness on the highways. Although the death rate from disease has decreased during the last decade, flagrant violations of highway safety rules have resulted in a constantly increasing death and injury rate from motor vehicle accidents.

During the first five months of 1953, 14,230 persons were killed in motor vehicle accidents in the United States, a 4% increase over the 13,740 persons killed during the same period of time in 1952. According to "Accident Facts," published yearly by the National Safety Council, in 1952 motor vehicle accidents in the nation resulted in 38,000 deaths, caused injuries to 1,350,000 persons, and cost \$3,750,000,000. There were 33,000 fatal accidents, 900,000 nonfatal injury accidents, 3,400,000 accidents causing property damage of \$25 or more, and 5,200,000 accidents causing property damage of less than \$25.

Seven out of 10 motor vehicle deaths in 1952 occurred in rural accidents, and more than half of all deaths occurred at night. Nearly one-fourth of the fatally injured were pedestrians. Collisions between motor vehicles were mostly head-on and sideswipe crashes. The principal non-collision accident was running off the roadway at curves.

Excessive speed was the most important driver violation. Nationally, 28% of the drivers in fatal accidents were driving too fast for traffic, weather, and/or road conditions, even though they may not have been exceeding a legal speed limit. In urban areas, right of way violations were second in importance, in rural areas, failing to keep right of the center line was second.

In 23 out of 100 fatal accidents, a driver or a pedestrian had been drinking, 10 out of 100 drivers or pedestrians had some bodily defect. Adverse weather was reported in one out of four fatal accidents, while 6% of vehicles involved in fatal accidents had one or more unsafe conditions, in nearly one out of eight fatal accidents, the driver's vision was obscured. Two out of five fatal accidents occurred on Saturday and Sunday.

Reduction of the ever-increasing motor vehicle death rate is everyone's responsibility. Most motor vehicle accidents are avoidable. The person behind the wheel of the automobile is responsible not only to himself but to all others for observing all speed laws and traffic signs, for maintaining his vehicle in proper working order, and for making certain that he is in proper physical and mental condition to operate the vehicle. He must observe not only the road and persons directly ahead of him, but he must be cognizant of traffic and pedestrians on either side of and behind him. Pedestrians also are individually responsible for reducing the death rate from motor vehicle accidents. They must observe all safety rules and regulations designed for their protection.

Physicians have a unique position in the prevention of motor vehicle accidents. They are able to work with individuals and organizations in an advisory capacity to ascertain when a person should or should not drive an automobile. If a physician has a patient who, for one reason or another, should not operate a motor vehicle, it is his duty to proffer such advice. A physician should not wait until a patient asks him if he can drive an automobile, the majority of persons will not seek such counsel. Such advice may save a life—and the life may be that of someone dear to the physician or the patient.

Certain conditions are contraindications for operating a motor vehicle, and physicians are best informed about them. Individual evaluation as to whether or not a person should drive an automobile should be made of persons

who have just had certain types of physical examinations or who have just received an anesthetic, of persons taking certain drugs such as antihistamines and sedatives, of persons with mental instability, uncontrolled diabetes, and certain forms of epilepsy, and of persons with heart disease or severe hypertension

Only by assumption of such individual responsibility can the death rate from motor vehicle accidents be reduced. Such accidents are unnecessary, they can and must be abated. In such a program physicians everywhere can be and should be helpful.

RELIEF FROM RAGWEED

The control of unwanted vegetation that harbors insects, blisters the skin, or produces undesirable types of pollen has been largely unsuccessful because of the lack of convenient and relatively inexpensive means of eradicating the offending plants. The widespread distribution of pollen-producing weeds such as various species of *Ambrosia* (ragweed) and skin-irritating vines, bushes, and shrubs of the genera of *Toxicodendron* (poison ivy, sumac, and oak) has been one of the principal obstacles to successful management of seasonal allergic rhinitis and contact dermatitis due to these causes. The introduction of selective herbicides has renewed interest in the control of these and other noxious plants.

The most widely heralded herbicide development of the past decade was the public announcement in 1944 of the growth-regulating properties of 2,4-dichlorophenoxyacetic acid (2,4-D). Weed control through growth regulation marked a new departure in herbicides and offered one of the most promising methods for eliminating noxious vegetation such as ragweed and plants of the genus *Toxicodendron*. Through health education and community organization the removal of these plants in urban and other frequented areas is now both possible and practical.

Ragweed is among the more sensitive of common weeds to 2,4-D, and pollen formation may be prevented by the use of spray and fog methods of dispersion. Destruction of ragweed should be undertaken in the early part of August so as to prevent the shedding of pollen and the dropping of seeds. 2,4-D is most effective on poison ivy around the end of the growing season, when large leaf surfaces are presented to the action of the chemical. A subsequent spraying a month later may be necessary for those plants surviving the initial treatment, however, use of the growth-regulant late in the season is not recommended, because the plants are dormant and largely unaffected by the material.

While 2,4-D is noncorrosive, nonexplosive, and noninflammable, caution must be taken when using it in the vicinity of cultivated plants. It attacks most broad leaf plants and is effective in exceedingly small amounts (10 ppm or less). Care must be taken to avoid drifting of

spray dust or fumes to flowering plants and fruit trees in the vicinity of spraying. Spray equipment must also be thoroughly decontaminated by washing with alkali or kerosene to remove residual chemical remaining after use of aqueous and oil sprays. Although sensitivity may be experienced by persons sensitive to compounds of the phenolic type, 2,4-D is comparatively harmless to animals and humans. It is not irritating to the skin except in concentrated forms, although the petroleum products used in certain formulations may be a cause of complaint. The dusts of 2,4-D can be irritating to the eyes and respiratory tract, and precautions against this should be undertaken during application.

Various formulations of 2,4-D are available under a variety of trade names. The label accompanying each product provides a statement of composition as well as complete instructions for application. The directions for use should be scrupulously followed if full benefit from the compound is to be obtained.

CANCER AS A CHRONIC DISEASE

Numerous case reports indicating the unpredictability of cancer as a disease are scattered throughout the medical literature. It has been observed that in any series of untreated cancer patients certain patients will have a much longer survival rate than the average, with some tumor types disappearing spontaneously and others seemingly growing in cycles, with periods of rapid growth alternating with stationary periods or actual recessions. Moreover, the phenomenon of delayed recurrence has been observed, wherein the tumor reappears years later either in the scar that has been produced by previous surgical intervention or in the surrounding area. Occasionally, metastatic cells appear dormant in lymph nodes and other vital structures of the body without ever producing symptoms, sometimes, however, rapid metastasis occurs throughout the body after a prolonged period of quiescence.

Morton and Morton¹ recently summarized their experiences with a group of 17 cases of cancer that originated in various organs, including the thyroid gland, neck, breast, orbit, parotid gland, and the kidney. These cases were unusual in that the patients had prolonged periods of active, useful life, even though the malignant disease had not been completely eradicated by surgical means. They point out that cancer may behave as a chronic disease for more than a quarter of a century, that there is wide variation in the individual resistance of patients to malignant growths, and that chronicity is not confined to any particular type of cancer. In view of the absence of a completely acceptable explanation for the prolonged survival rate of some patients afflicted with cancer, there is need to be cautious in estimating the survival rate of patients when offering a prognosis to patients and their families. Furthermore, prolonged and sometimes unexplainable periods of survival after diagnosis of cancer reveal why some so-called cancer treatments are accorded at least temporary support.

1 Morton J J Jr and Morton J H. Cancer as a Chronic Disease. *Ann Surg* 137: 683 (May) 1953.

ORGANIZATION SECTION

OPINION SURVEY AND INVENTORY OF MEDICAL CARE, PERSONNEL, AND FACILITIES IN MECKLENBURG COUNTY, NORTH CAROLINA

David G. Welton, M.D., Charlotte, N. C.

Early in 1951, a special study committee¹ was appointed by Dr. Monroe T. Gilmour, then president of the Mecklenburg County Medical Society, to determine the facts about medical care in Charlotte and Mecklenburg County, North Carolina. To make this community study comprehensive in scope, the society invited representatives of the dentists, nurses, Negro physicians and dentists, public health departments, and hospitals to participate. All responded. The public was represented by an outstanding civic leader who was director of public libraries within the county.

So far as known, the opinion survey portion of this study was the first of its type done in the South, it was also the only one done in the United States that included a significant Negro representation—of 29%—and that was conducted as part of an inventory of medical facilities. Five hundred residents, in a cross section sample, were personally interviewed.

PUBLIC OPINION FINDINGS

The highest praise for medical services was given to the availability of surgeons when 97% of those interviewed and who expressed an opinion said that they had no difficulty securing the services of surgeons. The availability of doctors was rated next, with 90% stating they had no difficulty securing services, availability of nurses next, with 88%, availability of dentists next, with 86%, and availability of hospitals next, with 85%.

Seventy-two per cent of those who expressed opinions said they thought doctors' charges were fair, this proportion was 5% less than of those who said nurses' charges were fair. Sixty-four per cent said surgeons' charges were fair, and an identical percentage said the same about dentists' charges. Drug bills and hospital bills scored lower. Sixty-one per cent with opinions said drug bills were fair, and 49% said hospital bills were fair.

When persons in Mecklenburg county, however, were asked 'Do you think it is proper to ask what the charges will be before engaging the services' of doctors, surgeons, dentists, drug stores, hospitals, and nurses, they replied 64% no for drug stores, 58% no for doctors, 34% no for dentists, 28% no for hospitals, and 20% no for surgeons and nurses.

Although 85% or more of those interviewed who expressed an opinion praised the availability of each one of the medical services, their percentages of favorable responses were much smaller when they were asked if they thought there is a shortage of medical personnel and facilities. Eighty-six per cent said there was a shortage of hospitals, and 70% said there was a shortage of nurses. Sixty per cent said there was a shortage of doctors, 44% said there was a shortage of dentists, 34% said there was a shortage of surgeons, and 15% said there was a shortage of drug stores. The survey showed that 80% of the families in the county have a family doctor.

President Mecklenburg County Medical Society

Mr. Lawrence Rember, Director of Field Service, Department of Public Relations, American Medical Association, assisted in preparing the section on public opinion findings and in condensing the original report.

1. Members of the Study Committee of the Mecklenburg County Medical Society were 1951 and 1952: Dr. David G. Welton, Chairman; Dr. William T. Raby, Vice Chairman; Dr. Andrew Taylor, Secretary; 1951: Dr. Gregg Watters, 1952: Dr. Addison Brenizer, Jr., Research; Dr. Ralph Bell, Physician Personnel; Dr. Z. Vance Kendrick, Charlotte Dental Society; Miss Ann Rhodes, District Nurses Association; Dr. M. B. Bethel, City and County Health Services; Dr. Rudolph M. Wyche, Negro Physicians and Dentists; Mr. Marshall Pickens, Hospital Facilities; and Mr. Hoyt Galvin, the Public. The Advisory Group were Drs. Hamilton McKay, V. L. Hart, Luther Kelly, H. L. Newton, Monroe T. Gilmour, ex-officio 1951, and E. R. Hipp, ex-officio 1952.

Sixty-seven per cent have a family dentist, 63% have a family drug store, and 43% have a family surgeon and a family hospital. Only 2% have a family nurse.

Eighty-five per cent with opinions said their family doctor makes house calls willingly. But only 61% of those interviewed knew about the Medical Emergency and Information Service operating in Charlotte that gives out medical information and obtains doctors for emergency calls.

Eighty per cent with opinions said they would like itemized statements from doctors. Thirty-seven per cent said they thought their doctor would charge more if he knew they had medical insurance.

A lack of information about doctors' overhead costs was revealed when those with opinions—and only 34% of those interviewed had them on this question—estimated that their doctor on the average pays only 14.2% of his income for professional and office expense. The national average for overhead for doctors is actually 41 cents out of every dollar taken in. The overhead estimate for dentists averaged 11.4%, whereas the national average is 45%. Only 29% of those interviewed ventured an opinion on the percentage of work time given by doctors to the care of charity patients. They estimated on the average 18.5% for physicians and surgeons. The 20% with opinions estimated 7.1% for dentists. Slightly more than half, 52% of those holding opinions, thought that doctors' charges have increased as much as food. The 1951 Consumers' Price Index and Price Indexes for Medical Care show instead that, while the fees of the general practitioner, surgeon, and specialist in large cities have gone up 45.2%, food prices have risen in these same cities 127.4% over the 1935-1939 average.

Seventy-one per cent of those interviewed said they carried hospitalization insurance. Eighty-five per cent of those with opinions said they thought that public tax funds should be used to pay for hospitalization of those unable to pay. Seventy-five per cent said they favored merging city and county health departments, but only 60% said they favored merging city and county governments. Only 53% of those interviewed had opinions about the merging of local health departments, and only 49% had opinions about merging of local governments.

THE AREA SURVEYED

Interviews were conducted in Charlotte, Davidson, Cornelius, Matthews, Huntersville, Pineville, and in rural Mecklenburg County late in 1951 and early in 1952. Charlotte is the largest city in the Carolinas, with a recorded population of 135,000. Sixty-five thousand additional persons reside in the rest of Mecklenburg County surrounding Charlotte, making a total county population of 200,000. Approximately 65% are native born white persons and 35% are Negroes, with less than 1% being foreign born.

The average per family income in Charlotte was \$5,500 in 1950. In the heart of the Piedmont region of the Carolinas, there are more than 650 textile mills within a 100 mile radius of Charlotte, which has served as the medical center for this area for more than 50 years.

There are 225 available physicians, 65% of whom are board-certified specialists. Dentists number 84, graduate nurses 792, and hospital beds, 1,032.

THE METHOD

Proportionate representation of high, middle and low income groups, and varied age, sex, racial, educational, occupational, urban, and rural groups was achieved in the sample. The interviewing was done by Mrs. Olga Porter, formerly of Charlotte, a trained interviewer, with experience on surveys for the University of North Carolina and numerous business organizations. Because the society did not have the facilities for properly tabulating and analyzing the survey findings, it appealed to the American Medical Association for assistance. As a result, Lawrence W. Rember, Director of Field Service

for the Department of Public Relations, came to Charlotte to consult with the society and to extract and to write the reports for release to the public. Keying and tabulating of the data was done under the direction of Dr. Frank Dickinson, head of the Bureau of Medical Economic Research of the A M A. Question by question, the results to the 27 statistical questions of the survey follow.

FAMILY MEDICAL RELATIONSHIPS

1 Do you have a family doctor?

Yes	80%
No	20

Only 43% of those interviewed said they had a family surgeon. Only 43% said that they had a family hospital, indicating that the majority of persons go where their doctor or surgeon recommends or where there is an available bed. Only 2% said they had a family nurse.

2 Do you have a family dentist?

Yes	87%
No	33

3 Do you have a family drug store?

Yes	63%
No	37

AVAILABILITY OF MEDICAL CARE

4 Do you have trouble securing the services of doctors?

Yes	9%
No	88
No answer	3

Of those who did express an opinion, 10% said they had trouble securing the services of a doctor and 90% said they did not. Of the 89% who expressed an opinion on securing the services of surgeons, 3% said they had trouble and 97% said they did not. Of the 94% who expressed an opinion on securing the services of hospitals, 15% said they had trouble and 85% said they did not. Of the 84% who expressed an opinion on securing the services of nurses, 12% said they had trouble and 88% said they did not.

5 Do you have trouble securing the services of dentists?

Yes	18%
No	83
No answer	4

Of those who did express an opinion, 14% said they had trouble securing the services of a dentist and 86% said they did not.

6 Do you have trouble securing the services of drug stores?

Yes	1%
No	99

QUANTITY OF MEDICAL CARE

7 Do you think there is a shortage of doctors?

Yes	53%
No	30
No answer	12

Of those who did express an opinion, 60% said they thought there was a shortage of doctors and 40% said they thought not. Of the 71% who expressed an opinion on whether or not there is a shortage of surgeons, 34% said they thought so and 66% said they thought not.

Of the 90% who expressed an opinion on whether or not there is a shortage of hospitals, 86% said they thought so and 14% said they thought not. Of the 74% who expressed an opinion on whether or not there is a shortage of nurses, 70% said they thought so and 30% said they thought not. The percentages of persons expressing a considerable belief that there is a shortage of doctors, hospitals, and nurses are in marked contrast to the answers given by respondents to parts of question 4, in which a high percentage said they had had no trouble securing these medical services.

North Carolina now has three four year medical schools, within another two years, a total of about 175 physicians will be graduated annually from these three schools. A newly established school of dentistry at the University of North Carolina will soon be graduating approximately 50 dentists each year.

8 Do you think there is a shortage of dentists?

Yes	80%
No	45
No answer	10

Of those who did express an opinion, 44% said they thought there was a shortage of dentists and 56% said they thought not.

9 Do you think there is a shortage of drug stores?

Yes	14%
No	81
No answer	5

Of those who did express an opinion, 15% said they thought there was a shortage of drug stores and 85% said they thought there was not.

ASKING CHARGES BEFORE ENGAGING SERVICES

10 Do you think it is proper to ask what the charges will be before engaging the services of doctors?

Yes	42%
No	58

Eighty per cent of those interviewed said that they thought it was proper to ask the surgeon what he would charge before engaging his services. The percentage was the same regarding nursing service, and 72% said the same thing about hospital services.

11 Do you think it is proper to ask what the charges will be before engaging the services of dentists?

Yes	66%
No	34

12 Do you think it is proper to ask what the charges will be before engaging the services of drug stores?

Yes	80%
No	64

FAIRNESS OF CHARGES

13 Do you think the charges that doctors make are fair?

Yes	65%
No	20
No answer	10

Of those who did express an opinion, 72% said they thought that doctors' charges were fair and 28% said they thought they were not. Of the 58% who expressed an opinion on the fairness of surgeons' charges, 64% said they thought the charges were fair and 36% said they thought not. Of the 80% who expressed an opinion on the fairness of hospital charges, 49% said they thought the charges were fair and 51% said they thought not. Of the 52% who expressed an opinion on the fairness of nurses' charges, 77% said they thought the charges were fair and 23% said they thought not.

14 Do you think that the charges which dentists make are fair?

Yes	50%
No	31
No answer	13

Of those who did express an opinion, 64% said they thought that dentists' charges were fair and 36% said they thought not.

15 Do you think the charges that drug stores make are fair?

Yes	54%
No	30
No answer	11

Of those who did express an opinion, 61% said they thought that drug stores' charges were fair and 39% said they thought not.

16 Do you think doctors' charges have increased as much as food costs?

Yes	43%
No	40
No answer	17

Of those who did express an opinion, 52% said they thought that doctors' charges have increased as much as food costs and 48% said they thought not. The actual increase over the 1935-1939 average is 45% for doctors' charges and 127% for food prices.

17 Do you think your doctor charges more when he knows you have medical insurance?

Yes	28%
No	48
No answer	24

Of those who did express an opinion, 37% said they thought that their doctor charges more when he knows they have insurance and 63% said they thought not

LOCAL GOVERNMENT PARTICIPATION

18 Do you think public tax funds should be used to pay for hospitalization for those unable to pay?

Yes	76%
No	13
No answer	11

Of those who did express an opinion, 85% said they thought public tax funds should be used to pay for hospitalization of the needy and 15% said they thought not

19 Do you favor merging city and county health departments?

Yes	40%
No	13
No answer	47

Of those who did express an opinion, 75% said they favored merging city and county health departments and 25% said they did not

20 Do you favor merging city and county governments?

Yes	29%
No	20
No answer	51

Of those who did express an opinion, 60% said they favored merging city and county governments and 40% said they did not. It is clear here that an education job needs to be done to inform more citizens about the advantages of such mergers. The significant finding here is that such a large percentage had no opinion at all.

INCOME OF DOCTORS

21 Would you like itemized statements from doctors?

Yes	72%
No	18
No answer	10

Of those who did express an opinion, 80% said they would like itemized statements from doctors and 20% said they would not.

22 What percentage of the full income would you estimate is paid for professional and office expense by your doctor? By your dentist?

	Doctor	Dentist
Public's estimate	14%	11%
Actual	41	45

The highest estimate of the 34% and 31% of persons, respectively, who expressed an opinion was 75% and the lowest estimate was 1% showing an extreme range of opinion and a considerable lack of information about doctors' and dentists' overhead costs.

23 What percentage of work time do you estimate is given to charity patients by doctors? By dentists?

Doctors	19%
Dentists	7

The highest estimate of the 29% expressing an opinion in regard to doctors was 60% and the lowest estimate was 0%. The highest estimate of the 20% expressing an opinion in regard to dentists was 40% and the lowest estimate was 0%.

HOSPITALIZATION INSURANCE

24 Do you carry hospitalization insurance?

Yes	71%
No	29

25 Do you carry Blue Cross?

Yes	84%
No	37

HOUSE CALLS

26 Does your family doctor make house calls willingly?

Yes	66%
No	12
No answer	22

Of those who did express an opinion, 85% said their family doctor makes house calls willingly and 15% said he did not.

27 Do you know about Medical Emergency and Information Service operating in Charlotte and Mecklenburg County?

Yes	61%
No	39

VERBATIM COMMENTS

In addition to the answers that were given to the 27 statistical questions, verbatim comments and criticisms were solicited from the residents of Mecklenburg County as to what they thought was wrong with their doctors, hospitals, dentists, and health departments. Residents of Mecklenburg were asked also to make suggestions for the improvement of medical care.

The five comment questions were so worded that they requested and encouraged the expression of criticism rather than praise, since the main purpose of the survey was to obtain suggestions for the improvement of medical care in Charlotte and Mecklenburg County and not laudations of its virtues. Among the comments, nevertheless, were many a commendation. Where the respondent volunteered a compliment, it, too, was recorded.

Less than 50% of the citizens who were interviewed had any kind of unfavorable criticism. Out of a total representative sample of 500 interviews, 49% expressed a criticism about hospitals, 46% about doctors, 20% about dentists, and 7% about the health department. The remainder of those interviewed apparently were satisfied with the medical care that they were receiving. At least they had no criticism to offer.

WHAT THEY SAID ABOUT DOCTORS

Criticism of doctors centered mostly around refusal to make house or night calls and high fees and then dropped sharply for the other complaints. Eighty-eight per cent of the doctor criticisms fell into the following 10 categories:

	No. of Criticisms
Refusal to make house or night calls	10a
Extreme or too high fees	46
Long waiting period and lack of definite appointments	24
Slow responses to house calls	22
Mercenary attitude	15
Too much specialization and not enough family doctors	14
Fees based on ability to pay or greater after 6 p m or midnight	13
Attitude too professional cold impersonal	12
Too hurried or too busy	12
Demand that patient come to hospital and too much telephone diagnosis	10

The various remaining criticisms about doctors received five or less mentions out of the total of 500 persons interviewed. Slightly more than one person out of two expressed no criticism of doctors.

ABOUT HOSPITALS, DENTISTS, AND HEALTH DEPARTMENTS

The main criticisms of hospitals were made in this descending order: need more hospitals and hospital space, not enough doctors, nurses, and general personnel, impersonal and hurried service, too mercenary an attitude, inefficient management and help, and unappetizing or insufficient food, too strict in visiting or other rules, lack of cleanliness, and slow emergency attention and admittance procedures. Not quite one out of every two persons expressed a criticism of hospitals.

The main criticisms about dentists were high fees and long waiting for appointments. Only one out of every five persons expressed criticism of dentists.

As for the city health department, many persons were unaware of its existence or activities. The 7% who did have complaints to offer scattered their criticisms over so many different categories that no one type of complaint was made.

by more than 4 persons out of 500 Only one out of every 14 persons expressed any criticism about the city health department

SUGGESTIONS FOR IMPROVING MEDICAL CARE

Although all of those interviewed were asked to make suggestions for the improvement of medical care, only 63% had a suggestion to offer Five hundred and five improvement suggestions were made by 315 persons

The gist of what they suggested was "more" more hospitals, more doctors, more nurses, more interns and residents, more clinics, and more of other things

Here is how they would improve medical care

	No of Sug- gestions
More hospital space more facilities or more hospitals	105
More doctors and family doctors	87
More house calls by doctors	74
More nurses and personnel	46
More immediate emergency care and less admittance red tape	21
Less mercenary attitude and lower rates	20
More personal doctor patient basis	19
Better and more considerate service for charity patients	18
More interns and resident doctors	13
Increased effort for adequate insurance	13
More free and low fee clinics	10
Less telephone diagnosis	8
Charge according to ability to pay	7
Shorten office waiting time	7
Less specialization	6
More doctors interns and facilities in hospitals at night	4

Ninety one per cent of the suggestions were made in these 16 categories The remaining 9% were divided among 33 other types of suggestions, none of which received more than three mentions and most less

INVENTORIES OF MEDICAL CARE

The public opinion survey comprised one of the six key phases of the fact finding survey that was conducted by the study committee in Charlotte and Mecklenburg County The other five phases included individual inventories of physicians, nurses, hospitals, dentists, and public health services, covering personnel and facility resources

Of the 205 physicians engaged in active private practice in Mecklenburg County, 152 answered part or all of the inventory questionnaire on physician personnel All percentages given are of those expressing an opinion The replies show that the vast majority of physicians, or 97%, usually answer night calls from their own patients when the illness or injury comes within their field of practice But the number of physicians is somewhat less, 80%, who will take night calls from new patients

The next question asked was "Considering 100% as your desired optimal load of medical practice, with due regard to adequate attention to the patient on the one hand, and to your own time and health—but not money—on the other hand, during the past six months what percentage of this load have you averaged?" (An overworked doctor might answer 125%, a newly established doctor 30%) At least 32 out of the 152 physicians replying would like to, and were able to, take on a quarter more or even double the amount of work that they were doing. They were mostly the younger, less well known men The 60% of the public who thought there was a shortage of doctors in Mecklenburg County and the 34% who thought there was a shortage of surgeons are not aware apparently that a number of younger doctors have entered practice in their county who could take care of considerably more patients

The great increase of physicians in Mecklenburg County following the end of World War II was evidenced by the 40% who replied that they had practiced in Charlotte five years or less at the time of the 1951 inventory Another 10% have been in practice less than 10 years

Slightly under 40% (381) were engaged in either general practice or internal medicine, the division was about half and half The remaining 62% practiced in the fields of general surgery, obstetrics and gynecology, pediatrics, urology, ophthalmology, orthopedics, ear, eye, nose and throat, radiology, dermatology, neurosurgery, pathology, neurology psychiatry, and proctology in that descending order from 9% to 1% Judging from the fields of practice reported, Mecklenburg County is "short" on general practitioners and "long" on board-certified specialists Many specialists do serve, even so, as "family" or "personal" physicians

That the great majority of the physicians in Mecklenburg County were willing to take care of charity patients was evidenced by the fact that 96% accept and treat patients unable to pay, and another 3% do so occasionally

Physicians were asked "Excluding pure charity, what percentage of your 1950 accounts did you collect?" In over half of the cases, the answers were an estimated amount rather than a recorded one Eighteen physicians collected over 90% of their accounts Ninety two physicians collected 75 to 90% of their accounts Twenty five physicians collected 48 to 74% of their accounts

The next question sought to determine the percentage of a doctor's patients coming from outside the county Forty-six physicians reported 5 to 8% Thirty four physicians reported 10 to 25% Thirty-two physicians reported 26 to 50% Twenty three physicians reported over 50% It is to be expected in a medical center that a significant amount of time would be spent by the medical profession in the care of out-of-county patients

The inventory of physicians' data indicates that there is no drastic shortage of physicians in the community The data reveals also that a great majority of the doctors in Mecklenburg County do their best to meet the demands made upon them The most acute need indicated by the inventory is for additional general practitioners, particularly more Negro physicians This, the physician's "side of the story," makes an interesting comparison with comments by the public

ALLIED INVENTORY FINDINGS

Lack of space and consideration for length rule out covering in detail the inventory findings for hospital, nurse, public health, and dental personnel and facilities in Mecklenburg County

The total of 1,032 general hospital beds and 161 bassinets available in Charlotte on March 1, 1952, exceeds the minimum of 45 beds per 1,000 population that the U S Public Health Service says a "base area," such as Charlotte, should have Three general hospitals for white persons reported 82 additional beds were under construction in 1952 The rate of bed occupancy in these three hospitals was 87% (The United States average was 74% that year)

The 394 graduate active nurses (nonfederal) per 100,000 population counted in the community study was more than double the national average of 188 in 1949 Nevertheless it is difficult in the city and county to obtain a private duty nurse on short notice, particularly for night duty It is estimated that there are at least 100 additional registered nurses in the county who are inactive

The department of health in Charlotte ranked second in expenditures from local sources, sixth in expenditures from all sources, and fourth in dollars and cents per capita in all public and private agencies Its \$3.14 per capita expenditure is considered very good The public health department of Mecklenburg County had a per capita expenditure of \$1.46 in 1950 Its 1950 budget was \$92,270 This contrasts with a \$421,362 budget for the Charlotte public health department From the over-all viewpoint, merger of the health departments of the city and of the county is desirable and should be accomplished without lowering any of the standards now maintained in the city

A dentist population ratio of 41 nonfederal dentists per 100,000 population in Mecklenburg County does not equal the national average of 53 dentists per 100,000 population in 1950 Five of the 49 answering dentists, however, are

doing only 30 to 70% of the amount of dental practice that they would like to do, and another 15 are doing only 75 to 95% of the optimal load they desire. The inventory showed that local dentists spend much less time caring for out-of-the-county patients than do the physicians.

THE STUDY COMMITTEE'S RECOMMENDATIONS

Based on the public opinion survey and inventory findings, the Study Committee of the Mecklenburg County Medical Society formulated these recommendations to the profession:

A In the Field of Professional Service

1. Be sure your fees are 'fair'. In order to avoid misunderstandings about financial matters, encourage discussion of major charges in advance (a) by displaying the A M A plaque entitled 'To All My Patients' in your waiting room or consultation room, and (b) by bringing up the subject yourself or, if you prefer, suggest that the patient discuss it with your (properly trained) secretary.

2. Improve the servicing of house calls, especially at night, both personally and by participation in the emergency and information service plan. When called by a patient whose complaint does not properly require your own services, contact a colleague yourself and arrange service.

3. Encourage more specialists to serve as family or personal physicians, at least to some extent (for example, as explained in point 2).

4. Improve practice procedures, such as (a) when too busy to take a new patient, refer him to a colleague, perhaps to a younger man who may not be too busy, (b) render itemized bills, and (c) maintain adequate office space and adequate well-trained personnel, so that you may render good service with a minimum of waiting time.

5. Encourage more physicians and dentists, particularly general practitioners, to come to the community. Negro members of these two professions are especially needed.

B In the Field of Public Health

1. Direct added efforts toward reducing the neonatal mortality.

2. Provide additional clinics for Negro children.

3. Promote a satisfactory merger of the city and county health departments.

C In the Field of Information for the Public

1. Encourage everyone to have a 'family doctor'.

2. Bring before the public, through various mediums, the facts about (a) actual operating expenses and overhead costs of physicians and dentists, (b) the cost of training physicians and dentists, and what is being done in our own state to produce more, (c) the relatively small increase in professional fees as compared with the increase in prices of food, clothing, and other basic requirements during the past 12 years, (d) why hospital costs are what they are, and (e) the advantages of a combined city and county health department.

CONCLUSION

Because most of the members of the study committee are engaged in private practice, this work had to be done in what "spare time" was available, which meant evenings not devoted to other medical meetings and Sunday afternoons. As a result, almost two years were required to obtain, assemble, tabulate, and analyze the data. As the work of the committee progressed, the findings were presented first to the county medical and dental societies and then released in unaltered form with their permission, to the local newspapers. By demonstrating our desire to bring to light any deficiencies in our field of service to the citizens of this community, we believe we have enhanced our relations with them. We believe that deficiencies such as these once known can best be remedied by efforts initiated at the local and county level. We now have a sound basis on which to formulate improvements that should be of value to the patients and to all professional personnel engaged in serving the medical needs of the community.

403 N. Tryon St.

STATEMENT BEFORE HOUSE COMMITTEE ON INCOME TAX DEDUCTION OF MEDICAL EXPENSES

Gentlemen, I am Dr. David B. Allman of Atlantic City, N. J., where I am engaged in the active practice of medicine. I am a member of the Board of Trustees of the American Medical Association and I am appearing here today (June 17, 1953) as a representative of that Association relative to the deduction of medical expenses for income tax purposes.

The Committee on Legislation of the American Medical Association has considered a number of bills introduced during the 81st, 82nd and 83rd Congresses which are designed, in general, to authorize the deduction of all, or a larger percentage of medical expenses, from gross income for income tax purposes. The effect of this legislation would be to reduce or remove the limitation on such deductions imposed by existing law. Certain of these bills would also redefine the term 'medical expenses' to include amounts paid as premiums for prepayment health insurance.

The principle involved in all of these measures has been actively approved by the Committee on Legislation and by the Board of Trustees of the American Medical Association. Although no attempt has been made to work out the details of the formula to be applied, we are of the opinion that a greater measure of relief should be provided in this way for those individuals who have suffered from the financial burden resulting from the expense of a serious, long-term illness.

Although, as previously stated, the Association is on record as supporting legislation of this type, it might be well to discuss certain misconceptions concerning the present cost of medical care. Taken as a whole, medical costs are not out of line with other normal living expenses. Statistics presented by the United States Department of Labor for the third quarter of 1952 reveal that living costs have increased 90.8% since 1935-1939, while medical costs have increased only 65.5% in the same period.

In addition, it should be noted that recent surveys indicate that only 3% of American families have medical bills over \$200 and that 80% have no medical debts of any kind. Despite this fact, it is realized that a serious long-term illness can be a financial catastrophe to almost any family. Thus for some time, several insurance companies have been experimenting in a relatively new form of insurance called, among other titles, 'medical disaster' or 'catastrophic' coverage. A few of the agencies established by medical associations are also underwriting this newer version of protection. Its purpose is to provide sound protection in those instances requiring long-term or high-cost treatment. These ventures are being undertaken with the knowledge and full support of the medical profession.

The provisions of the bills pending before this Committee which are designed to permit deductions from gross income for the cost of prepayment health insurance should act as an inducement for people to join medical and hospitalization plans. Although the growth of voluntary health insurance is unparalleled in comparison with other advances recorded in the recent history of insurance, there are still segments of the population that are not covered. Despite the fact that 90,000,000 Americans have some form of protection, both physicians and underwriters are reviewing the basic standards of insurance to seek ways and means of improving this coverage.

We believe that the enactment of legislation of this type will further encourage the improvement of existing plans, will extend coverage, and will help to eliminate or reduce the financial burdens which do exist as a result of illness. It will also encourage people to look after their own health rather than turn to the government for assistance. We are sincerely convinced that our present nongovernmental system of medicine not only provides the best care but that it is also the most economical. We are therefore in accord with any legislation designed to help preserve that system.

STATEMENT BEFORE HOUSE COMMITTEE ON REORGANIZATION OF DEPARTMENT OF DEFENSE

Gentlemen I am Dr David B Allman of Atlantic City, N J, where I am engaged in the active practice of medicine I am a member of the Board of Trustees of the American Medical Association and I am appearing here today (June 18, 1953) as a representative of that Association relative to Reorganization Plan No 6, 1953

Although all of the provisions of the proposed Plan to reorganize the Department of Defense are of interest and concern to physicians as individual citizens, the interest of the American Medical Association is confined to Section 3 of the Plan

This section would authorize the appointment of six additional Assistant Secretaries of Defense from civilian life by the President by and with the advice and consent of the Senate Although the specific duties of these Assistant Secretaries are not specified in the Reorganization Plan, it is assumed that the assignments suggested by the report of the Rockefeller Committee on the Department of Defense organization dated April 11, 1953, would be favorably considered

As you are well aware, it is the recommendation of the Rockefeller Committee that one of the proposed Assistant Secretaries be placed in charge of health and medical affairs with the responsibility for maintaining high health standards among the personnel of the Armed Forces and for providing and managing hospitals and other medical installations at the smallest possible cost in dollars and professional personnel "

On Feb 7, 1953, the Board of Trustees of the American Medical Association approved a recommendation of the Council on National Emergency Medical Service that a position as Assistant Secretary of Defense for Health and Medical Affairs be created by law The Association believes that creation of such a position would insure proper correlation of military and civilian medicine, especially in the matter of apportionment of essential, highly trained health personnel

Although it is impossible to date the inception of the interest of the American Medical Association in military medical affairs, I should like to call the attention of the Committee to the activities of the Association in this regard since the enactment of special draft legislation designed to procure physicians for the Armed Forces

In August, 1950 and again last month the medical profession, after careful and thoughtful consideration, supported the need for special draft legislation, notwithstanding its discriminatory character The Association, in its discussions with the Department of Defense and in its testimony before the various committees of the Congress, has clearly stated its desire to terminate such legislation at the earliest possible time We have consistently recommended strongly that physicians and dentists called to active duty in the armed forces under this law be used efficiently and, except in unusual circumstances, for care of military patients rather than nonmilitary personnel

However, since the original enactment of this legislation in 1950, nonmilitary medical activities have increased We have been advised by representatives of the Department of Defense that compulsory legislation of this type will be necessary for five additional years or, until 1958 It is understandable, therefore, that the medical profession is seriously concerned and desirous of discovering alternative methods for meeting the requirements of the Armed Forces for health personnel

The existence of this law, plus the continuing need for civilian medical participation in military planning and operations as they relate to medical and health services and to the assignment and utilization of medical and allied health personnel, we believe, necessitates competent high level civilian direction within the Department of Defense We are happy to note that in this regard the message of the President of the United States transmitting Reorganization Plan No 6 to the Congress states There must be a clear and unchallenged civilian responsibility in the Defense Establishment "

It is our belief that the incumbent of the position as Assistant Secretary for Health and Medical Affairs should advise the Secretary of Defense concerning the development of policies, procedures and programs dealing with the coordination of the medical and hospital services of the Armed Forces and the mobilization and utilization of health personnel

STATEMENT BEFORE HOUSE COMMITTEE ON INCOME TAX DEDUCTION OF EDUCATIONAL EXPENSES

Gentlemen I am Dr Walter B Martin of Norfolk, Va., where I am engaged in the active practice of medicine I am President Elect and a member of the Board of Trustees of the American Medical Association and I am appearing today (June 18, 1953) as a representative of that Association relative to the deduction of college and educational expenses for income tax purposes

The American Medical Association has not taken any position with respect to the deduction of all college and educational expenses for income tax purposes However, the Association is vitally interested in the deduction of postgraduate educational expenses Although the present tax laws permit such deductions for ordinary and necessary expenses in a trade or business, there is no express provision permitting professional persons to deduct the cost of securing additional education

In connection with postgraduate medical education, your Committee may be interested in the fact that there is a total of 784 postgraduate courses available at this time Of this number 418 are offered on a full time basis and 366 on a part-time schedule These courses, which are available in 37 states, the District of Columbia and Puerto Rico, cover 34 major areas in the field of clinical medicine and 9 basic science subjects

A total of 134 agencies offer postgraduate medical training including 43 medical schools, 35 special medical societies, 18 hospitals, 12 academies of general practice, 11 state medical societies, 6 graduate schools of medicine and 3 agencies representing boards of health, schools of public health and government departments respectively

These courses are designed to be of assistance to physicians in general practice as well as to specialists in increasing their medical proficiency as well as to prepare them for specialty board certificates

For a considerable number of years the House of Delegates and the Board of Trustees of the Association have expressed concern over a ruling by the Commissioner of Internal Revenue holding that expenses incurred by a physician in pursuing postgraduate medical education are personal in nature and therefore not deductible for federal income tax purposes It has been extremely difficult to understand the validity of such a ruling because of the fact that physicians have been permitted to deduct the costs of attending medical meetings, of subscriptions to scientific publications and of dues paid to medical societies

Some time ago the Board of Trustees authorized the employment of a Special Tax Counsel to pursue this matter on behalf of the Association In an unsuccessful effort to obtain a new ruling from the Bureau of Internal Revenue, it was learned that there was pending before the United States Tax Court a case in which a lawyer had been denied the right to deduct expenses incurred by him in attending postgraduate courses on taxes In view of the fact that the case involved was quite similar to the one in which the medical profession was interested in, the American Medical Association filed a brief as amicus curiae The tax held against the taxpayer and an appeal was made to the United States Court of Appeals On April 14 the United States Court of Appeals reversed the decision of the United States Tax Court holding, in effect, that expenses incurred by the attorney in taking a postgraduate course were deductible for income tax purposes

While it is the belief of the American Medical Association that this decision probably applies to the practicing physician who attends postgraduate courses which are similarly designed to refresh his medical knowledge and to keep him informed regarding recent medical developments, it is by no means clear that the Court's decision covers attendance at postgraduate courses which are designed to advance the physician into a new area of his profession For example, there is considerable doubt whether a general practitioner may deduct his expenses in attending a postgraduate course in order to specialize in surgery

Also, it is not clear just how far the Bureau of Internal Revenue or the courts will follow this decision. If it is interpreted liberally all business and professional men will be entitled to deduct expenses incurred in attending refresher courses providing that there is a demonstrable tie in with their official duties. It appears more likely, however, from the wording of the decision, that a deduction would be disallowed in cases in which the taxpayer fails to show that he was bound, either contractually or morally, to keep abreast of changes in his particular field, and that attendance at an institute or refresher course was the proper way to do it.

In view of these areas of doubt, it is the belief of the American Medical Association that the issue should be settled by new legislation rather than be left to administrative interpretation or judicial decision. We would strongly urge, therefore, that your committee give favorable consideration to an amendment to the existing law authorizing the deduction of postgraduate educational expenses for income tax purposes.

FEDERAL MEDICAL LEGISLATION

Withholding Health Insurance Premium for Federal Employees

Senator Carlson (R, Kans) in S 2191 would authorize the withholding from federal payrolls of subscription charges for voluntary prepayment hospital and medical care insurance programs, at the request of the employee. The withheld money would be paid by the federal agency to the respective voluntary prepayment plans selected by the employee. This measure is similar to H R 1590 by Congressman Miller of California, previously reported. However, the Miller bill would cover accident and life insurance as well as health and hospitalization insurance. This measure was referred to the Post Office and Civil Service Committee.

Care of Veterans in State Veterans' Homes

At the request of the American Legion, Congresswoman Rogers (R, Mass) would amend the present law to authorize, in H R 5892, a federal contribution of \$700 per annum per veteran cared for in a state or territorial veterans' home, but the federal contribution could not exceed half of the total cost per veteran. Eligible veterans are those "disabled by age, disease, or otherwise, and by reason of such disability incapable of earning a living, provided such disability was not incurred in service against the United States." The present law authorizes a federal contribution of \$500 annually until 1956 and \$300 thereafter. In the fiscal year ending June 30, 1952, the federal contribution under this program amounted to \$3,892,135.15. The bill was referred to the Veterans' Affairs Committee.

Medical and Hospital Care for Disabled Retired Veterans

Congresswoman Rogers (R, Mass) proposes in H R 5893 that "any person retired from active service in the Armed Forces of the United States, who is in need of medical or hospital care for an injury, disability, or disease incurred or aggravated in line of duty in such service and who would be eligible to receive disability compensation from the Veterans Administration if he were not receiving retired or retirement pay shall be entitled to receive such care from the Veterans Administration subject to the same limitations as such care is furnished to veterans who are in receipt of disability compensation from the Veterans Administration." Under the present law, a veteran receiving a disability pension from the Veterans Administration is entitled to hospitalization for a service-connected condition. However, a veteran receiving disability retirement pay from one of the armed forces in certain circumstances would have to renounce his military pay during the period of treatment and qualify for a VA pension. The proposed bill would amend the law to authorize

hospitalization for a service-connected condition without requiring the veteran to have one form of compensation replaced by another. This measure was introduced at the request of the American Legion to carry out a mandate of its last convention. This measure was referred to the Veterans' Affairs Committee.

Total Disability Insurance Benefits

Congressman Radwan (R, N Y) in H R 5917 would amend the Social Security Act to provide disability insurance benefits for totally disabled persons. Disability is defined as "(A) inability to engage in any substantially gainful activity by reason of any medically determinable physical or mental impairment, or (B) blindness." Who shall determine disability is not specified. The amendment was referred to the Ways and Means Committee.

Problems of the Aged

Congressman Campbell (D, Fla) in H R 309 would create a select committee to be composed of seven members of the House of Representatives to investigate (a) the status of older persons, (b) "the most effective utilization of our older population group," and (c) the basic problems in the fields of employment, health, education and community services of our older population group. The resolution is identical with H R 13 (Bolling), previously reported, and four other resolutions. It was referred to the Rules Committee.

STATE MEDICAL LEGISLATION

Connecticut

Bills Enacted.—H 993 has become Special Act No 239 of the Acts of 1953. It directs the governor to appoint a commission to make a study of the potentials of the aging residents of the state including a survey of the employment and security problems of persons who have attained the age of 65. S 722 has become public act no 244 of the acts of 1953. It requires physicians to report to the state department of health the name and address of each person known to him to be subject to recurrent attacks of epilepsy or to recurrent periods of unconsciousness uncontrolled by medical treatment.

Florida

Bills Enacted.—H 535 became law without approval June 15 1953. It authorizes the state board of osteopathic medical examiners to pass upon the standing and reputability of osteopathic schools and colleges and osteopathic hospitals. H 557 became law without approval May 21 1953. It provides that states attorneys or county solicitors may in their discretion have autopsies performed upon dead bodies found within the county either before interment or after whenever in their opinions such autopsies are necessary in order to ascertain whether death resulted from a criminal act or by the result of criminal negligence. H 1680 became law without approval June 15 1953. It authorizes the county commissioners in certain counties in the state to include in the annual budget an item for a full time local health unit and to contribute and pay from the general fund to the state treasury to the account of the state board of health a sum of money for the maintenance of a full-time local health unit. S 351 was approved June 12 1953. It provides for the licensing and regulation of nursing homes.

New Jersey

Bill Introduced.—A 664 to amend the medical practice act, proposes that any veteran who shall be more than 30 years of age of good moral character and a citizen of the United States and a resident of this state and who has or shall have completed a four year-course of study in a public high school a four year premedical course of study in a premedical college a four year course of study in and a degree of doctor of medicine from a medical college two years of service as an intern or resident physician in a hospital licensed in the state and who has successfully passed an examination given by a state board in another state in the subjects of anatomy physiology pathology chemistry and bacteriology and who is licensed to practice medicine and surgery in such state shall be entitled to a license to practice medicine and surgery in New Jersey.

Bill Enacted.—A 137 has become ch. 190 of the laws of 1953. It requires every physician to report to the office of the superintendent of state police within twenty four hours after determining that any person is suffering from the effect of the use of a narcotic drug taken for purposes other than the treatment of sickness or injury as prescribed or administered by a person duly authorized by law to treat sick and injured human beings.

Vermont

Bill Enacted.—S 10 was approved May 26 1953. It amends the law relating to medical examiners by providing that the state pathologists may appoint 25 medical examiners who shall be licensed doctors of medicine or osteopathy.

MEDICAL NEWS

ARKANSAS

State Medical Election—At the annual meeting in Little Rock the Arkansas Medical Society elected Dr Richard C Dickinson, Horatio, president, Dr William R Brooksher, Fort Smith, president-elect, Drs John H Wilson, Magnolia, Thomas Wilson, Wynn, and Johnnie P Price, Monticello, vice-presidents, Dr Daniel H Autry, Little Rock, treasurer, and Dr John J Monfort, Batesville, secretary

University News—The University of Arkansas School of Medicine, Little Rock, has received a gift of \$1,000 from Dr Louis Friedman of Birmingham, Ala, to promote alumni activities and public relations—O Boyd Houchin, Ph D, Iowa State College, has been appointed assistant professor of neurology at the University of Arkansas School of Medicine, Little Rock. Dr Houchin will devote his time to the study of the biochemistry of the brain, a project now in operation in the department of neurology under the sponsorship of the United Cerebral Palsy Associations, Inc

CALIFORNIA

Joseph McCarthy Prize Awarded—At the recent meeting of the Western section of the American Urological Association, in San Francisco, the Joseph F McCarthy prize essay award of \$200 was given to Drs Joseph J Kaufman, Beverly Hills, Milton Rosenthal, Culver City, and Willard E Goodwin, Los Angeles, for their paper "Methods of Diagnosis of Carcinoma of the Prostate A Comparison of Clinical Impression, Papanicolaou Stains, Needle Biopsy, Transurethral Biopsy and Open Perineal Biopsy" The study emanated from the University of California at Los Angeles School of Medicine and the VA Center, Los Angeles

Japanese Honor Colonel Hunter—Residents of Nagatoishicho, Japan, have erected a monument to Col George W Hunter, Ph D, San Francisco, who from 1947 to 1949 supervised periodic spraying of irrigation ditches in their city, which were breeding grounds for disease bearing snails Incidence of schistosomiasis is said to have been reduced by more than 98% The monument is a life sized bronze bust of Dr Hunter, resting on a cairn of native rock. The inscription, chiseled in Japanese, reads in part 'His sacrificial work and guidance over the two years were greatly appreciated by the population It is our sincere wish to erect this bronze statue for Doctor Hunter in order to praise and remember forever his great work'

COLORADO

Awards in Recognition—At the annual banquet of the University of Colorado Medical Alumni Association, Awards in Recognition were made to the following graduates of the University of Colorado, or of the Gross Medical College or the University of Denver College of Medicine, which were absorbed by it Drs Edward Delchanty Sr, Charles S Elder, Aubrey H. Williams, George R Warner, Rudolph W Arndt, Archibald D Attwood, Robert W Fraser, John M Barney, Wilson C Birkenmayer, Cuthbert Powell, Charles A Bundsen, Walter W King, Denver; Dr Angus Taylor, Pueblo, Dr Walter S Chapman, Walsenburg, Drs Frederick W Lockwood and Arthur F Williams, Fort Morgan, Dr John H. Larson, Wray, Dr Edward W Lazell, Santa Barbara, Calif, Dr Tobias Espinosa, Espanola, N Mex., and Dr Ella A Mead, Greeley All persons who received the award have been in practice 50 or more years

Physicians are invited to send to this department items of news of general interest for example those relating to society activities new hospitals education and public health Programs should be received at least three weeks before the date of meeting

CONNECTICUT

Industrial Institute at Yale Center of Alcohol Studies—To meet the demand for specialized training of key personnel in the establishment of programs of education and rehabilitation of problem drinkers in business and industry, the Yale Center of Alcohol Studies, New Haven, will conduct a training session at Yale University July 27-31 The session will acquaint selected representatives of business and industry with the nature of problem drinking in industry, with policies of treatment, retirement, and separation, with procedures and resources for treatment, and with programs of education and prevention Among the lecturers will be Drs S Charles Franco, Brooklyn, associate medical director, Consolidated Edison Company of New York Giorgio Lolli, research associate, applied physiology, Yale University, and medical director of the Yale Plan Clinic and the Connecticut Commission on Alcoholism, Robert C Page, New York, general medical director, Standard Oil Company of New Jersey, and Arnold Z Pfeffer, assistant clinical professor of psychiatry, New York University College of Medicine and physician in-charge, Consultation Clinic for Alcoholism, University Hospital, New York. The first two days of the session will be devoted to lectures and discussions covering the physiological, psychological, and sociologic aspects of the problem Requests for additional information and applications for admission should be addressed to Yale Center of Alcohol Studies, Industrial Institute, 52 Hillhouse Ave, Yale Station, New Haven

DISTRICT OF COLUMBIA

Dr Forster Named Dean—Dr Francis M Forster, head of the department of neurology, has been named head of the Georgetown University School of Medicine to succeed the Reverend Paul A McNally, S J, regent and dean of the school of medicine, who has been forced to relinquish his position because of ill health The Reverend McNally will become dean emeritus and director of the Georgetown Medical Center Dr Forster was previously affiliated with Jefferson Medical College, Philadelphia, Harvard Medical School, Boston, Boston University School of Medicine, and Yale University School of Medicine, New Haven, Conn He has served at Good Samaritan Hospital in Cincinnati, Boston City Hospital, and the Pennsylvania Hospital in Philadelphia He is the former secretary and present chairman of the A M A Section on Nervous and Mental Diseases He will retain his present post as professor of neurology and head of the department.

ILLINOIS

Personal—Dr George H Vernon, for many years director of the Palmer Sanatorium in Springfield, has accepted appointment as director of the Madison County Sanitarium, Edwardsville

Welfare Advisers Named—Dr Otto L. Bettag, Illinois state director of public welfare, has appointed as consultant in psychiatry Dr Roy R Grinker, clinical professor of psychiatry at the University of Illinois College of Medicine, Chicago and director of the Institute for Psychosomatic and Psychiatric Research and Training of Michael Reese Hospital, and as consultant in research Dr Ralph W Gerard, professor of neurophysiology and physiology, University of Illinois College of Medicine

Society News—At the annual meeting of the Illinois Chapter of the American College of Chest Physicians, Dr Abel Froman, Chicago, was elected president, Dr Clifton F Hall, Springfield, vice president, and Dr Albert H Andrews Jr, Chicago, secretary—The Scientific Service Committee of the Illinois State Medical Society is revising the list of speak

ers available to county medical societies. All physicians wishing to be included are urged to send in their names, a list of subjects for which they would be available, and their affiliations with medical school teaching staffs and hospital staffs. Mention should also be made of the type of slides used in talks and titles of movies if available. Write to Dr Louis R. Limarzi, Chairman of the Scientific Service Committee, Illinois State Medical Society, Rm 801, 185 N Wabash Ave., Chicago 1.

Chicago

Residence Hall at Cook County Hospital—The Dr Karl A. Meyer Hall, a 15 story residence for interns and resident physicians at Cook County Hospital, was recently dedicated. The new 3 million dollar building, at 720 S Wolcott Ave., is connected to the hospital by a tunnel. It will house 297

Karl A. Meyer Hall

persons. There are 283 single rooms for interns, 12 two room and 5 five room apartments for staff, a cafeteria, gymnasium, handball courts, game room, and snack bar. The library has been named in honor of Dr. Frederick Tice, who has served the hospital for many years.

Personal.—Dr. Donald G. Anderson, Chicago, Secretary of the A. M. A. Council on Medical Education and Hospitals, delivered an address "The Rebellion Against the Teaching of Scientific Medicine" at the recent commencement exercises of Boston University School of Medicine. Dr. William S. Kroger, assistant professor of gynecology, Chicago Medical School, gave a lecture "The Use of Hypnosis in Child Birth," with color and sound film, at Sinai Hospital, Baltimore, June 1, to the obstetric department of Johns Hopkins University School of Medicine, Baltimore, June 2, and at Mount Sinai Hospital, New York, June 5. Dr. George Halperin, associate editor of THE JOURNAL, returned recently from a five week trip to France, Italy, and Israel where he delivered a lecture on medical journalism before the faculty of the medical school of the Hebrew University of Jerusalem and the medical profession.

MARYLAND

Society News—The Radiologic Section of the Baltimore City Medical Society recently elected Dr. David N. Gould, Johns Hopkins Hospital, Baltimore, chairman, and Dr. H. Leonard Warren, 2337 Eutaw Place, Baltimore 17, secretary. At the initial meeting of the Maryland Radiological Society, the following officers were elected for the coming year: chairman, Dr. Richard B. Hanchett, Baltimore, vice-chairman, Dr. Edgar T. Campbell, Hagerstown, and secretary-treasurer, Dr. H. Leonard Warren, Baltimore.

Dean of Medical Faculty—Philip Bard, Ph.D., professor of physiology at the Johns Hopkins University School of Medicine, Baltimore, has been appointed dean of the medical faculty to succeed Dr. Alan M. Chesney, who has retired after nearly 25 years as dean of the school. In addition to serving as dean, Dr. Bard will continue in his present position in the department of physiology. He is the author of numerous scientific papers based on his research in physiology and medicine. During World War II, Dr. Bard served as special consultant to the government in the Office of Scientific Research and Development and on committees of the National Research Council. He has served on the faculties of Harvard and Princeton and has been selected to deliver numerous memorial lectures. Dr. Chesney, who has been dean of the school of medicine since 1929, will continue his association with the Hopkins institutions in an emeritus capacity. He plans to devote his immediate future to the completion of the second volume of his chronicle "The Johns Hopkins Hospital and the Johns Hopkins University School of Medicine," the first volume of which was published in 1943. Dr. Chesney was one of the founders of the Maryland Society for Medical Research, composed of laymen and physicians, which battled the antivivisectionists to an overwhelming defeat at the polls in 1950, when the antivivisectionists took the fight before the public on a referendum question.

MASSACHUSETTS

Dr. George Shattuck Honored—Dr. George C. Shattuck, clinical professor of tropical medicine, emeritus, Harvard Medical School, Boston, was recently honored for 30 years of service as chairman of the health council of the United Community Services of Metropolitan Boston. During a meeting at which Dr. Shattuck's retirement from the chairmanship was announced, the Health Council presented him with a citation which read in part: "The work which this organization has accomplished has been due in large part to your comprehension of public health work and your awareness of the needs of the community."

Dr. Schmidt Joins American Joint Distribution Committee—Dr. William M. Schmidt, since 1949 associate professor of maternal and child health practice, Harvard University School of Public Health, Boston, has submitted his resignation and in September will return to his former work as medical adviser to the executive council of the American Joint Distribution Committee with headquarters in Paris. Dr. Schmidt, who was previously regional consultant to the U.S. Children's Bureau in Washington, D.C., in 1950 made a survey for the state department of maternal and child health in the U.S. zone of Germany. He attended the first meeting of WHO's Expert Panel on Maternity Care in Geneva, November, 1951. While at Harvard, he served also as associate physician of the Children's Medical Center Child Health Division.

MISSOURI

State Medical Election—At the Kansas City session the Missouri State Medical Association installed Dr. E. Claude Bohrer, West Plains, as president and chose the following officers: Dr. Harold E. Petersen, St. Joseph, president-elect, Drs. Guy N. Magness, St. Louis, Frank R. Teachenor, Kansas City, and Thomas E. Ferrell, Springfield, vice presidents, Dr. Carl F. Vohs, St. Louis, treasurer, and Dr. Edward R. Bohrer, Jefferson City, secretary.

NEW JERSEY

Cardiovascular Traineeship—St Michael's Hospital, Newark, announces the establishment of a full time traineeship program in cardiovascular diseases, approved by the National Heart Institute. Information may be obtained from Dr Nicholas A Antonius, director of the department of cardiology.

Personal—Dr Frederick F Yonkman, vice president in charge of research for Ciba Pharmaceutical Products, Inc., Summit, has been elected to serve as a trustee of the Columbia University College of Pharmacy, New York. Dr Yonkman is on the teaching staff of Columbia University College of Physicians and Surgeons.—Dr Henry H Kessler, Newark, was recently named "citizen of the year" by the New Jersey Society of Professional Engineers, at a dinner at the Hotel Essex House, Newark.—Dr Harry B Slocum was honored at a dinner celebrating his 50 years on the medical staff of Monmouth Memorial Hospital, Long Branch.—The staff of Overlook Hospital, Summit, recently honored the following physicians for their service to the hospital and community: Dr John L Meeker, former staff member, who has practiced for 50 years and is now a consultant in medicine; Dr Arthur E. Tator, who was retiring from the active staff to become surgical consultant; Dr Cedric C Carpenter, who recently retired as president of the hospital medical staff; and Dr John M Atkinson, Madison, who succeeded him.

NEW YORK

Grant for Air Research—Dean Harold C Wiggers, Ph D., of Albany Medical College, has announced that a \$5,000 grant in aid has been given to the college by the Air Research and Development Command of the Air Force for studies on the effects of temperature extremes on body fluids and electrolytes. Gerald S Kanter, Ph D., who joined the medical college staff last year as instructor in physiology after doing research on the subject at the University of Rochester School of Medicine and Dentistry, will carry out the studies.

Art Contest—The Academy of General Practice Art Convention, which will hold its scientific exhibit at the Hotel Statler, New York, Oct 28-30, invites physicians of New York State to submit entries. A war bond prize will be awarded to the physician who best interprets in an oil painting the theme "Medicine Today." Originality and oil technique will be among the features considered. Entries in other fields, such as photography, sculpturing, and hobby work, may also be submitted. Dr F Donald Napolitano, 2281 University Ave., New York, has been reappointed chairman of the convention.

New York City

Dr McDonald Appointed Dean at Lebanon—Dr Joseph J McDonald, visiting surgeon and director of surgical services, Francis Delafield Hospital, has been appointed dean of the Medical School of the American University of Beirut, Lebanon, to succeed Dr Norman B Nelson who was named dean of the State University of Iowa College of Medicine in Iowa City. Dr McDonald, who served at the American University of Beirut as associate professor of surgery and chairman of the department from 1946 to 1950, was subsequently affiliated with Columbia University College of Physicians and Surgeons and Presbyterian Hospital.

Dr Gasser Retires as Rockefeller Director—Dr Herbert S Gasser, director of the Rockefeller Institute for Medical Research, recently reached the retirement age after more than 17 years of service. Dr Gasser, who with Joseph Erlanger in 1944 received the Nobel Prize for discoveries concerning the differentiated functions of nerve fibers, joined the institute in 1935, succeeding its first director, the late Dr Simon Flexner. He had previously been affiliated with (1) the University of Wisconsin Medical School, Madison, where as a student he served as instructor in physiology, (2) Washington University in St. Louis where he served as instructor in physiology and, after service in World War I, during which he did considerable

research in traumatic shock and in chemical warfare, was named head of its department of pharmacology and (3) Cornell University Medical College, New York where he was professor of physiology and head of the physiological laboratories.

NORTH CAROLINA

Medical Town Hall—Dr George J Baylin, program director, announces that Duke University School of Medicine, Durham, will present its second Medical Town Hall at 4 p.m. July 26, in the Physics Building auditorium. Topics will be skin diseases, including poison ivy, sunburn, poison oak, eczema, warts, acne, diaper rash, and other skin irritations. Speakers will be Dr Susan C Dees, associate professor of pediatrics, formerly a vice president of the American College of Allergists, and Dr J Lamar Callaway, professor of dermatology, past president of the Southeastern Dermatological Association, and formerly vice-chairman of the Southern Medical Association. Five university faculty members will join Drs Callaway and Dees as members of a panel to answer questions.

Health Center Dedicated at Chapel Hill—The University of North Carolina at Chapel Hill recently dedicated as part of its new health center the North Carolina Memorial Hospital, the school of dentistry, the school of nursing, and the new four year expanded school of medicine. Dr Henry T Clark Jr, administrator of the Division of Health Affairs, presided at the program in Memorial Hall. The speaker was Dr Joseph T Wearn, dean and professor of medicine at Western Reserve University School of Medicine, Cleveland. Dr W Reece Berryhill, dean, presided at the school of medicine meeting at which a portrait of Dr Hubert A. Royster, former dean of the medical school in Raleigh and dean emeritus of the university medical school, was presented. Dr Royster, who is a past president of the North Carolina Medical Society, is now professor of surgery emeritus at Chapel Hill. Among the other speakers at the dedication services were Dr David P Barr, professor of medicine, Cornell University Medical College, New York, and Dr Malcolm T MacEachern, Chicago, director of professional relations, American Hospital Association.

SOUTH CAROLINA

State Medical Election—At the annual meeting the South Carolina Medical Association installed Dr Charles R F Baker, Sumter, as president, and chose as president-elect, Dr Thomas R Gaines, Anderson. Reelected were Dr George D Johnson, Spartanburg, vice president, Dr Robert Wilson Jr, Charleston, secretary, and Dr J Howard Stokes, Florence, treasurer. Mr M L Meadors, Florence, was reappointed as executive secretary.

WEST VIRGINIA

Governor Appoints Licensing Board—Dr Oscar Bernard Biern, Huntington, who has served as secretary, vice president, and president of the Cabell County Medical Society, and as chairman of the State Medical Association's committee on mental hygiene, has been named by Gov William C Marland as a member of the medical licensing board for a five year term to succeed Dr Walter E Vest, also of that city. Other physician members of the board are Drs Frank J Holroyd, Princeton, George F Evans, Clarksburg, Cecil B Pride, Morgantown, William P Bittinger, Summerlee, and Doff D Daniel, Beckley. Dr Newman H Dyer, Charleston, state director of health, an ex officio member of the board, serves as its secretary.

WYOMING

Dr McEnery Honored—Dr Douglas W McEnery, cancer control officer and director of the division of communicable disease control, Wyoming Department of Public Health, was honored at a dinner given by the Wyoming division of the American Cancer Society, when an engraved medal from the American Cancer Society was presented to him.

GENERAL

Papers Invited for Cytology Meeting.—The first annual meeting of the Inter-Society Cytology Council will be held in Philadelphia, Nov 19-20. Those interested in presenting papers pertaining to the cytological method for the diagnosis of cancer and related subjects are urged to send titles, together with an informative abstract of not more than 300 words, before Aug 1 to the chairman of the program committee, Dr Abraham E Rakoff, Jefferson Medical College of Philadelphia, 1025 Walnut St., Philadelphia 3.

Psychiatric Endowment Fund.—The American Psychiatric Association (1785 Massachusetts Ave NW, Washington 6, D C) has established an endowment fund for the support of projects that will advance mental health. Contributions (which are tax exempt) will be used (1) to study the nature, causes, treatment, and prevention of mental disorders, (2) to raise standards of treatment and care for the mentally ill in hospitals, (3) to further psychiatric education and research, and (4) to make available psychiatric knowledge useful to other branches of medicine, other sciences, and to the public welfare.

Social Hygiene Awards.—At a social hygiene day luncheon in New York the American Social Hygiene Association recently awarded honorary life membership to Jacob A Goldberg, Ph.D., director of the New York Tuberculosis and Health Association's social hygiene division, Dr Charles D Bowdoin, venereal disease control officer, Georgia Department of Public Health, Atlanta, and Dr Gloyd G Wetherill, director of health education, San Diego (Calif) city schools. The association also bestowed on Bailey Barton Burritt, LL.D., the William Freeman Snow award for distinguished service to humanity.

Urology Award.—The American Urological Association offers an annual award of \$1,000 (first prize \$500, second prize \$300, and third prize \$200) for essays on the result of some clinical or laboratory research in urology. Competition is limited to urologists who have been in such specific practice for not more than 10 years and to men in training to become urologists. The first prize essay will appear on the program of the meeting of the American Urological Association at the Waldorf-Astoria, New York, May 31 to June 3, 1954. For full particulars, write the executive secretary, Mr William P Didusch, 1120 N Charles St., Baltimore 1. Essays must be in his hands before Feb 1, 1954.

Grant to Medical Social Workers.—A March of Dimes grant of \$39,043 has been awarded by the National Foundation for Infantile Paralysis to the American Association of Medical Social Workers for improving standards of practice in medical social work and the educational programs of students being trained for this field. The foundation has appropriated \$100,000 this year for the training of medical social workers. The scholarship program is administered directly by the national foundation with the assistance of a special scholarships committee that reviews the candidates' qualifications and recommends awards. Application for scholarships can be obtained from the National Foundation for Infantile Paralysis, Division of Professional Education, 120 Broadway, New York 5.

Research on Mental Illness.—The National Association for Mental Health has announced its intention to go into "large-scale" financing of research on mental illness. According to Mr Robert M Heiminger, executive director, with the exception of a comprehensive research program on schizophrenia for which funds have been contributed during the past 16 years by the Thirty-Third Degree Scottish Rite, the organization has heretofore usually "been content to encourage research and to help initiate it through consultation with government bodies, universities, hospitals, and other research centers." The new plan contemplates the direct allocation of funds for research by means of grants and the creation of a commission for research on mental illness. Preliminary planning on the research program will get under way early in the fall.

Birth Rate Among College Graduates.—The Population Reference Bureau in Washington, D C, has completed an eight year study of fertility rates of college graduates. It is said to show that the trend to have more children has been upward since 1936. Among the 1943 graduates, men averaged 1.63 children per graduate, and women, 1.30 children, among the 1936 graduates, fertility scores were 1.02 for men and 0.95 for women. The gain in the number of children per woman graduate of the class of 1943 over the alumnae of 1936 amounted to 36.8%. The study, conducted by Dr Clarence J Gamble and Mrs Betty U Kibbee, Milton, Mass., makes available data for individual colleges throughout the United States. Fertility scores of the 269 cooperating colleges are available on request to the Population Reference Bureau, Inc., 1507 M St., NW, Washington 5, D C.

Prevalence of Poliomyelitis.—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States, its territories, and possessions in the weeks ended as indicated.

FOREIGN

British Occupational Hygiene Society.—This society was inaugurated at the London School of Hygiene and Tropical Medicine on April 27. In addition to physicians the founder members include engineers, chemists, and physicists. The first president of the society is Dr T Bedford, director of the Environmental Hygiene Research Unit of the Medical Research Council at the London School of Hygiene and Tropical Medicine.

Meeting on Logopedics.—The convention of the International Association of Logopedics and Phoniatrics will be held Sept 15 at Zurich, Switzerland. Official reports will be given on "Congenital Language Disorders," "Physiology of the Voice," and "Electroacoustic Analysis and the Physiological and Esthetic Problems of the Voice." Requests for information should be sent to the Organizational Committee, Piazza S Ambrogio 9, Milano, Italy.

Angiologists to Meet in Lisbon.—The International Society of Angiology will hold a congress in Lisbon, Portugal, Sept 18-20, under the presidency of Dr Emile F Holman, San Francisco. At a joint session with the International Society of Surgery, Friday, a symposium on aneurysms will be presented. Saturday there will be a symposium on mitral valvular surgery, and on Sunday an angiology forum. Information may be obtained from Dr Henry Hamovici, Secretary General, 105 E 90th St., New York 28.

Microbiologists Meet in Rome.—The International Congress for Microbiology will convene in Rome, Italy, Sept 6-12 at the Città Universitaria. The following symposiums are planned: bacterial cytology, microbial metabolism, nutrition and growth factors, growth inhibitors and chemotherapy, morphology, biology, and systematics of the actinomycetales, and host-virus interactions. Communications should be addressed to the Segreteria del Congresso, Istituto di Igiene, G Sanarelli, Città Universitaria, Rome, Italy.

India Speeds Birth Control Program.—Because government officials believe that the threat of overpopulation is too critical for further delay, the \$1,300,000 birth control program, which was incorporated into India's master five year plan, adopted two years ago, is being put into operation ahead of schedule. T Lakshmi Narayana, deputy director general of health services in charge of family planning, stated that the program was expected to be in full operation by the end of the year. India's population, estimated at 365 million persons, increased 42 million between 1941 and 1951.

Congress on Medical Librarianship.—The first International Congress on Medical Librarianship will be held in London July 20-25 in the anatomy and physiology lecture theaters, University College, Gower Street, with the inaugural session in Beveridge Hall, Senate House, University of London, Malet Street. Tuesday afternoon a symposium on the role of medical libraries in the world today, which will be continued on Wednesday morning, will be followed by the opening of the Armed Forces Medical Library Exhibition at Wellcome Research Institution, 183 Euston Road, NW1 (4 p m). Thursday morning there will be two simultaneous sessions on medical libraries of the world, and Thursday afternoon a symposium on education and training for medical librarianship. Receptions will be held Monday at the British Medical Association House (3-45 p m) and at the Royal College of Surgeons of England (8-30 p m), Wednesday at the Royal Society of Medicine (6 p m), Friday evening at the Royal College of Obstetricians and Gynaecologists, at the Hall of Worshipful Society of Apothecaries, and at Ciba Foundation. A discussion on international cooperation has been scheduled for Saturday morning and visits to the British Museum and to Oxford for Saturday afternoon.

DEATHS IN OTHER COUNTRIES

Dr Harold Balme died recently after an operation at a hospital near his home in Beckenham, England. As consultant adviser on rehabilitation to the United Nations, the World Health Organization, and the UNICEF, Dr Balme served as

chairman of the UN Technical Working Group on the Rehabilitation of the Handicapped and was instrumental in the establishment and development of the coordinated international rehabilitation program being carried out by the UN and specialized agencies.

CORRECTION

William Beaumont, Pioneer Physiologist.—The paper on this subject by Dr Frederick Stenn was read before the Midwestern Regional Group of the Medical Library Association instead of the "Medical Section of the American Library Association" as stated in the footnote to this article in THE JOURNAL, July 4, 1953, page 915. The American Library Association does not have a medical section.

EXAMINATIONS
AND LICENSURE

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS. *Parts I and II.* All centers where there are five or more candidates. Sept. 8-10 (Part I only). Candidates may file applications at any time but the National Board must receive them at least six weeks before the date of the examination they wish to take. *Part III.* June 9-26. Examination will be held in each of 31 centers having five or more eligible candidates. Exec. Sec. Dr John P. Hubbard, 133 South 36th St., Philadelphia 4.

EXAMINING BOARDS IN SPECIALTIES

- AMERICAN BOARD OF ANESTHESIOLOGY.** *Written.* Various locations. July 16. Final date for filing applications was January 17. Sec. Dr C. B. Hickcox, 80 Seymour St., Hartford 15.
- AMERICAN BOARD OF DERMATOLOGY AND SYPHILIGOLOGY.** All candidates must now pass a written examination. *Written.* Various centers. Sept. 3. *Oral.* Philadelphia. Oct. 16-18. To be eligible, candidate must complete 36 months of training before Oct. 1. Final date for filing applications was May 1. Exec. Sec. Miss Janet Newkirk, 66 East 66th St., New York 21.
- AMERICAN BOARD OF INTERNAL MEDICINE.** *Oral.* San Francisco. Sept. 30-Oct. 2. Chicago, Nov. 30-Dec. 2. The closing date for acceptance of applications for the San Francisco and Chicago oral examination was April 1. *Written.* October 19. The closing date for acceptance of applications was May 1. Exec. Sec. Treas. Dr William A. Werrell, 1 West Main St., Madison 3.
- AMERICAN BOARD OF NEUROLOGICAL SURGERY.** *Oral.* New Haven. October. Final date for filing application is July 1. Sec. Dr Leonard T. Furlow, Washington University School of Medicine, Kingshighway and Euclid Ave., St. Louis.
- AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY.** *Written.* Various cities of the United States and Canada. Feb. 5. Application for examination or re-examination as well as requests for resubmission of case reports, must be made prior to October 1. Sec. Dr Robert L. Faulkner, 2105 Adelbert Road, Cleveland 6.
- AMERICAN BOARD OF OPHTHALMOLOGY.** Chicago. Oct. 5-9. *Written.* Various Centers. January 1954. Final date for filing applications is July 1. Sec. Dr Edwin B. Dunphy, 56 Ivie Road, Cape Cottage, Maine.
- AMERICAN BOARD OF ORTHOPAEDIC SURGERY.** Chicago. January 1954. Final date for filing application is August 15. Sec. Dr Harold A. Sofield, 122 S. Michigan Ave., Chicago 3.
- AMERICAN BOARD OF OTOLARYNGOLOGY.** *Oral.* Chicago. Oct. 5-9. Sec. Dr Dean M. Llerle, University Hospital, Iowa City.
- AMERICAN BOARD OF PATHOLOGY.** *Written.* *Pathologic Anatomy and Clinical Pathology.* Chicago. Oct. 8-10. Sec. Dr William B. Wartman, 303 E. Chicago Ave., Chicago.
- AMERICAN BOARD OF PEDIATRICS.** *Oral.* Ann Arbor. June 26-27. Place undecided. Oct. 9-11 (tentative), Indianapolis. November. Exec. Sec. Dr John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.
- AMERICAN BOARD OF PLASTIC SURGERY.** *Entire Examination.* San Diego, Oct. 29-31. Final date for receipt of case reports was June 1. *Entire Examination.* Galveston. April 17-19. Final date for receipt of case reports is Jan. 1. Corres. Sec. Mrs. Estelle E. Hillerich, 4647 Pershing Ave., St. Louis 8.
- AMERICAN BOARD OF PROCTOLOGY.** *Part II.* *Oral and Written.* *Anorectal Surgery and Proctology.* Philadelphia. Sept. 19. Sec. Dr Louis A. Bule, 102-110 Second Ave. S.W., Rochester, Minn.
- AMERICAN BOARD OF RADIOLOGY.** *Oral.* *Radiology.* *Röntgenology.* *Diagnostic Röntgenology and Therapeutic Radiology.* Chicago. Dec. 6-11. Final date for filing application is July 1. Sec. Dr B. R. Kirklin, 102-110 Second Ave. S.W., Rochester, Minn.
- BOARD OF THORACIC SURGERY.** *Written.* Various centers throughout the country. September 11. Final date for filing application is July 1. Sec. Dr William M. Tuttle, 1151 Taylor Ave., Detroit 2.

Wilson, Harry Edmond ♂ Port Orchard, Wash, College of Physicians and Surgeons, Baltimore, 1905, served on the staffs of the Harrison Memorial and Puget Sound hospitals in Bremerton, died April 4, aged 74, of coronary thrombosis

Young, Jack Rufus, Florala, Ala, Tulane University of Louisiana School of Medicine, New Orleans, 1946, served during World War II, died April 23, aged 31, of leukemia

GOVERNMENT SERVICES

ARMY

Dr Smadel Honored—The University of Chicago recently presented the Howard Ricketts Medal to Dr Joseph E Smadel, scientific director of the Army Medical Service Graduate School, Washington, D C, for his work with antibiotics in the treatment of typhus Dr Smadel has been chief of the department of virus and rickettsial diseases since 1946 and technical director of research (communicable and parasitic diseases) since 1950 He is also visiting lecturer in virology at the University of Maryland School of Medicine, Baltimore He has been director of the commission on immunization, Armed Forces Epidemiological Board, and a member of the virus and rickettsial study section, United States Public Health Service, since 1946 and a member of the committee on virus research and epidemiology and research fellowship in virology, National Foundation for Infantile Paralysis, since 1948 Dr Smadel holds the U S Army Typhus Commission Medal, the Gordon Wilson Medal, and the Exceptional Civilian Service Award

Personal.—Major Gen William E Shambora, Chief Surgeon, U S Army, Far East, was honored April 9 as one of the eight alumni chosen by Georgetown University Alumni Association for the 1953 John Carrol Distinguished Service award In the absence of General Shambora, the Surgeon General designated Col Floyd L Wergeland to receive the award for the general.

NAVY

Course for Reserve Officers in Field Medicine—A two week course in field medicine for inactive reserve medical department officers of the 11th, 12th, and 13th Naval Districts will convene at the marine barracks, Camp Joseph H Pendleton, Oceanside, Calif, Aug 17, 1953 Practical instruction in medical matériel logistics, preventive medicine in the field, professional treatment in emergencies, and medical organization with fleet marine units are included In addition, the trainee will receive practical instruction of a military nature, including the maintenance and use of small arms, items of individual field equipment, and practical march and bivouac routines Inactive naval reserve medical corps, medical service corps, and hospital corps officers residing in the 11th 12th, and 13th Naval Districts who desire to attend this course should submit requests to the commandant of the home Naval District at the earliest possible date Bachelor quarters will be available, and working uniform is required Attendance will not in any way, increase the possibility of involuntary recall to active duty Eligible officers may attend this course on active duty with training orders in a pay status

PUBLIC HEALTH SERVICE

New International Vaccination Certificates.—The new International Certificates of Vaccination form, which will enable international travelers to complete immunization requirements more expeditiously, will be ready for use about July 1, 1953 This form supersedes the present International Certificate of Inoculation and Vaccination, PHS 731 (FQ) and provides an official record of compliance with vaccination requirements, acceptable to all nations governed by the International Sanitary Regulations, which went into effect last October It contains vaccination certificates for smallpox yellow fever, and cholera, and space to record other immunizations At present vaccination against typhus and plague is not required

With the new form, a recording of the results of the smallpox vaccination is no longer necessary, except in cases of

primary vaccination In cases of revaccination the smallpox certificate becomes valid immediately, whereas previously a 14 day wait was required The cholera certificate in the new form becomes valid six days after the first injection The old form required that the series be completed The type of vaccine being used in this country provides maximum protection only after the second injection, and the attention of international travelers will be called to the advisability of taking this second shot The yellow fever vaccination certificate in the new form is valid for six years

Smallpox and cholera certificates will be certified by local health officers as in the past, however, health officers must use their official stamps, if they do not have one, they should prepare a special stamp for the purpose of certifying these documents On the new form the signature of the health officer is not necessary, and signature alone is not valid Yellow fever vaccination certificates issued in the United States are valid in international travel only when the inoculation is obtained from a yellow fever vaccination center designated by the U S Public Health Service

The Public Health Service plans to distribute the International Certificates of Vaccination with passport application forms through clerks of the court and from passport agencies located in Boston, New York City, San Francisco, New Orleans, Chicago, and Washington, D C, beginning about July 1 Thus, prospective travelers will have more time for immunizations than under the present system, which provides the form upon issuance of a passport Persons going into countries that do not require a passport may obtain the form from local or state health departments or from facilities of the Public Health Service The certificate may be obtained also from the Superintendent of Documents, Government Printing Office, Washington 25, D C, at a cost of \$05, or \$1 50 for 100 copies delivered to the same address Organizations wishing to print their own certificates must obtain the written permission of the Division of Foreign Quarantine, Epidemiology and Immunization Branch, Public Health, Washington 25, D C

The old form will be accepted in international travel until the expiration date of the recorded vaccinations Agencies having a supply of this form may continue to distribute them until their stock is exhausted When the old form is used its specifications with regard to smallpox vaccination must be complied with, but the new regulations with regard to yellow fever and cholera certification may be applied Under the new regulations, the Department of Defense will issue its own certificate to military personnel on active duty, however, military dependents must continue to use the new International Certificates of Vaccination

Superior Service Award—Dr Henry M Freidman of the Public Health Service has just received the Superior Service Award of the Department of Health Education, and Welfare The award, the highest given by the department, was presented by Secretary Oveta Culp Hobby Dr Freidman, who is retiring after more than 45 years of service, is a medical supervisor on the staff of the U S Foreign Quarantine Service, Port of New York Secretary Hobby said, "He has amply earned the gratitude and esteem of his countrymen As a Foreign Quarantine Officer, he has worked with his fellow officers in the vital job of guarding our shores against disease and pestilence It is no exaggeration to say that our country is safer and healthier because of the skill and devotion of such men" Dr Freidman practiced medicine near his home on the Lower East Side of New York until 1907, when he received an appointment with the U S Public Health Service For many years, he has been a leader in developing programs for the care of dependent children and is at present, director of medical care for the Jewish Child Care Association of New York

Laboratory Courses—Schedules of laboratory refresher training courses to be given at the Venereal Disease Research Laboratory, Chamblee, Ga., during the fiscal year, July 1, 1953, to June 30, 1954, have been announced as follows

Dates	Courses	Duration Weeks
Aug 17 18 1953	Serology of syphilis	2
Sept 17 28 1953	Serology of syphilis	2
Oct 5-16, 1953	* Management and control of syphilis serology by the regional laboratory	2
Oct 19-23, 1953	† Laboratory diagnosis of venereal disease	1
Oct 26 to Nov 6, 1953	Serology of syphilis	2
Nov 9-20 1953	Preparation and standardization of cardiolipin antigens used in serologic tests for syphilis	2
Dec 7 18 1953	Serology of syphilis	2
Jan 11 22 1954	Serology of syphilis	2
Feb 8-19 1954	Serology of syphilis	2
March 8-19 1954	Serology of syphilis	2
April 5-16, 1954	Serology of syphilis	2
May 3-14 1954	Serology of syphilis	2
May 17 28 1954	Preparation and standardization of cardiolipin antigens used in serologic tests for syphilis	2

* This course designed for assistant laboratory directors and senior laboratory staff members includes review of interlaboratory training programs regional laboratory evaluation studies laboratory inspection procedures demonstration of antigen check testing and control serum preparation

† This course is designed for P H S physicians laboratory directors and assistant laboratory directors

Correspondence should be sent to Director, Venereal Disease Research Laboratory, P O Box 185, Chamblee, Ga

Dr Wilder Retires—Dr Russell Wilder, director of the National Institute of Arthritis and Metabolic Diseases at Bethesda, Md., brought to a close a 45 year career when he retired, for reasons of health, on July 1. An internationally known nutritionist and authority on diabetes, Dr Wilder became the first director of the National Institute of Arthritis and Metabolic Diseases shortly after its creation in 1950. He directed an intensive research program against arthritis, rheumatism, and metabolic diseases that included laboratory research at Bethesda, administration of grants in support of research and training in nonfederal institutions, and preparation for clinical investigations in the new clinical center of the National Institutes of Health that just admitted its first patients.

Before serving with the arthritis institute, Dr Wilder was with the Mayo Foundation and Clinic, Rochester, Minn., from 1919 to 1950. In 1940, he was chairman of the committee on medicine of the National Research Council in which he organized the food and nutrition board. Later he served as chief of the civilian food requirements branch, War Food Administration. He was a special consultant to the research facilities planning committee of the National Institutes of Health in 1950. For 20 years he was a member of the American Medical Association's Council on Foods and will be remembered for his part in bringing about the general acceptance and use of enriched white flour and bread. During World War I he served in the Army as a medical officer. Dr and Mrs Wilder will return to their home in Rochester.

Gordon to Head National Leprosarium—Dr Eddie M Gordon has been appointed Medical Officer in Charge of the U S P H S Hospital (National Leprosarium), Carville, La. Dr Gordon succeeds Dr Frederick A Johansen, who retired June 1 after 29 years of service at Carville. Dr Gordon comes to Carville from Chicago, where he has been in charge of the local U S P H S Hospital. The retiring medical officer, Dr Johansen, participated actively in the evolution of the modern sulfone therapy and later guided the installation and organization of the hospital's community activities and rehabilitation services. He is widely recognized as an authority on leprosy.

Personal—Dr Myron D Miller has been appointed medical officer in charge of the U S Public Health Service Hospital, Seattle, effective Aug 1, succeeding Dr William W Nesbitt, who died suddenly on May 7.—Dr David J Zaugg has been appointed medical officer in charge of the U S Public

Health Service Hospital, Chicago, effective July 1, succeeding Dr Eddie M Gordon, recently assigned to head the U S Public Health Service Hospital (National Leprosarium) at Carville, La.

VETERANS ADMINISTRATION

Vacancies for Occupational Therapists.—The Veterans Administration has many vacancies for occupational therapists and physical therapists at VA centers and hospitals throughout the United States. These vacancies are at grade GS-5, with the salary of \$3,410 to \$4,160 per annum, and grade GS-7, with the salary of \$4,205 to \$4,955 per annum. Persons thus employed enjoy excellent employment conditions and also have an essential part in aiding their government. Further information may be obtained from Mr Jerome J Deutsch or Mr Walter J Shanley by calling Main 5 7400, extension 369 or 371, Brooklyn 1, or from the Executive Secretary, Committee of Expert Examiners, Veterans Administration, Washington 25, D C.

Personal.—Dr Alexander W Kruger of Washington, D C., has been appointed manager of the Veterans Administration Hospital at Manchester, N H., succeeding Dr Bernard L. Allen. Dr Allen has been transferred to the new VA Hospital at West Haven, Conn. Dr Kruger was born in Russia but was educated in the United States. He practiced medicine in New York City nine years (1925-1934), and from 1948 through 1951 was general medical superintendent, Department of Hospitals, City of New York. He served as a lieutenant commander in the Navy Medical Corps from June, 1944, to November, 1945.—The Veterans Administration announces the appointment of Dr Stewart T Ginsberg of Marion, Ind., as manager of the new 956 bed neuropsychiatric hospital nearing completion at Pittsburgh and of Dr Louis M Hohman of Indianapolis as manager of the 200 bed general medical and surgical hospital at Clarksburg, W Va.

MISCELLANEOUS

Atoll Research Program.—The Coral Atoll Research Program sponsored by the National Academy of Sciences National Research Council, with financial assistance from the Office of Naval Research, is being continued with the despatch from Honolulu of three scientists to Ifaluk Atoll in the Western Carolinas, in September, four more men will go to Ifaluk. The field work, which will be concluded in November, will parallel the pattern of ecologic investigations that have been made at the atolls of Arno in the Marshalls, Onotoa in the Gilberts, and Raroia in the Tuamotus as part of a five year program of basic research. Results will be correlated with other atoll research. This program is also associated with an atoll project of the six government South Pacific Commission concerned with problems affecting the economy of atoll peoples in Pacific areas administered by Australia, France, New Zealand, Netherlands, United Kingdom, and the United States. Ifaluk is a small atoll about 400 miles south of Guam, with a land area of one half a square mile, and with 250 inhabitants that have had little contact with other islands. In 1948, E G Burrows and M E Spiro spent several months there under a Pacific Science Board project supported by the Office of Naval Research as part of a Coordinated Investigation of Micronesian Anthropology. Dr Burrows, who is professor of anthropology at the University of Connecticut, will return to Ifaluk as the leader of this summer's team.

Foreign Scientific Visitors.—The National Academy of Sciences National Research Council, Office of International Relations, is receiving an increased amount of information on the travel plans of foreign scientists and engineers who plan to visit the United States, and it has arranged a list of these visitors, together with their itinerary, in order that any group or society desiring to contact them for the purpose of arranging lecture engagements or to visit their institutions may do so. Further information may be obtained by writing to the above office at 2101 Constitution Ave., Washington 25, D C.

FOREIGN LETTERS

DENMARK

Cytological Tests for Lung Cancer.—At the Thoracic Surgery Department of the Copenhagen City Hospital of Øresund, directed by Dr Tage Kjaer, much work has been done recently in diagnosis of lung cancer by the microscopic examination of presumptive tumor cells found in the bronchi and sputum. Valuable pioneer work has been done in this field by Dr H. H. Wandall, whose study, published in 1944, showed that tumor cells could be found in 84% of patients suffering from primary bronchogenic cancer. Commenting on this study in *Nordisk medicin* for May 8, 1953, Dr J. Iversen emphasizes the importance of Wandall's investigations because they included a large number of patients who were not suffering from malignant disease of the lungs and, therefore, who served as controls. Dr Iversen's study from the above mentioned Thoracic Surgery Department concerned 124 cases of primary bronchogenic cancer, in 57 of which (46%) malignant cells were found in the sputum or bronchial secretion. Among 629 patients suffering from nonmalignant disease, there were 9 in whom the cytological test yielded an erroneous diagnosis (1.4%) of malignant disease. Five of these nine mistaken diagnoses were made in the first 200 patients examined and the other four among the some 700 patients examined at a later date. These figures suggest that the already low error rate of 1.4% could be further reduced by the experience gained by practice. The rate of correct diagnoses can be increased by repeating the test, but unfortunately even a trained cytologist needs about half an hour to complete a thorough scrutiny of the cells to be examined in a given case.

Dr Iversen has also undertaken a study of 250 verified cases of bronchogenic cancer treated in his hospital between December, 1948, and July, 1952. In all these cases either the sputum or the bronchial secretion or both were examined cytologically. In 152 cases squamous cell carcinoma was diagnosed. The remaining 98 cases represented other forms of carcinoma. The cytological test was positive in 76 of the squamous cell cases (50%) and in 110 of the total of 250 cases (44%). Dr Iversen concludes that the cytological test is of diagnostic value, a matter of great importance in operable cases of bronchogenic cancer.

Therapeutic Studies of Arterial Hypertension.—In several Danish hospitals much attention is being paid to the medical treatment of hypertension. At the Medical Department of the Frederiksborg County Central Hospital, Dr Vagn Rønnow-Jessen and Dr Viggo Bech have given an extensive trial of hexamethonium to 20 patients suffering from severe arterial hypertension. At first the drug was given orally in the form of the bitartrate of hexamethonium, 2 tablets of 0.25 gm each being given three times daily, the dosage being gradually increased to 16 tablets daily. Only two of the eight patients treated in this way responded satisfactorily. The drug was next given subcutaneously as well as orally. A 10% solution of the bromide of hexamethonium was then given twice a day, the initial dose of 15 mg being gradually increased by 5 to 10 mg after every other injection. This increase of dosage was continued till each injection was followed by a suitable fall of blood pressure lasting a few hours. Of the 20 patients treated by this combined oral and parenteral mode of administration 2 discontinued treatment within three weeks and a third after three months. The remainder have continued this treatment for several months. Side-effects included severe constipation, from which nearly all the patients suffered at the beginning of the treatment. Giddiness due to a fall of the blood pressure usually passed off after a few weeks, partly because the dosage most suitable for each patient had been discovered by them, there was, however, one patient who discontinued the treatment after a fortnight on account of

giddiness. In as many as 11 cases blurred vision and difficulties on reading were experienced, but they were transitory with only one exception. On account of these and other drawbacks to this treatment, it seems to be indicated only for patients seriously handicapped by hypertension. On the other hand, it is admitted that hexamethonium marks a significant epoch in the treatment of hypertension. Its administration should always be started in hospital where the suitable dosage can be established and the reactions to it closely controlled.

From the Medical Department of the Aarhus County Hospital comes a report by Dr Poul Bechgaard and Dr Leif Paulsen on tests they have carried out with Hydergine (methanesulfonates of dihydrogenated ergotoxine alkaloids) whose beneficial action on hypertension has recently been reported in Swiss and German publications. Among the 34 patients given parenteral injections of this drug were 14 who responded with a fall of blood pressure, while a slight effect was obtained in 12 and none in 8. As compared with hexamethonium, Hydergine would seem to be definitely less effective. In *Ugeskrift for Læger* for April 16, 1953, which contains the reports referred to above, tables and graphs are given illustrating details of the tests to which the patients were subjected when treated in hospitals.

Births, Marriages, and Deaths.—A government report on movements of the population in 1951 shows what profound changes can take place in a comparatively short time with regard to such acts as marriages and divorces. For example, in the five year period 1941-1945 there were only 4,868 divorces yearly in Denmark. In the next five year period this figure had jumped to 7,084 yearly. In 1951 it was lower, with only 6,681, a figure corresponding to 18% of the marriages in the same year. The average duration of marriage before divorce was 10 years, but one third of the divorces followed marriages of less than five years' duration. In the five year period 1925-1930 only 4.7% of the men and only 3.5% of the women marrying each year in this period were divorcees. The corresponding percentages in 1951 for men and women were 13 and 12, respectively. In this year the average age of hitherto unmarried persons at the time of marriage was 27 years for men and 24 years for women. As was to be expected, the men who married after the age of 60 greatly outnumbered the women marrying after this age (562 men to 166 women). In 1951 the number of mothers giving birth to twins was 1,008, and 10 gave birth to triplets. Up to 1948 the percentage of infants born from year to year out of wedlock was remarkably constant 10%. In 1951, the number of illegitimate infants constituted only 7% of all the births.

Operations for Hemorrhoids Compared.—In the 16 year period 1935-1950 a total of 235 patients were operated on for hemorrhoids at the Bornholm County Hospital, Milligan's operation being performed in the first half of this period and the Jørgen Jensen modification of Whitehead's operation in the second half. Recently Dr Mogens Felbo and Dr Ole Kofod, who are attached to this hospital, have succeeded in contacting 173 of these patients, 98 of whom underwent the modified Whitehead operation and 75 the Milligan operation. The percentage of patients expressing satisfaction with the operation was much the same for the two groups (82% Whitehead and 81% Milligan). But while 26% of the patients who underwent the Whitehead operation complained of post-operative rectal hemorrhage, only 17% of those having Milligan's operation did so. The Whitehead operation proved inferior to the Milligan technique also with regard to the recurrence or relapse rate, which was 14% for the former and only 8% for the latter.

The Late Professor Bock.—Johannes C. Bock, the father of experimental pharmacology in Denmark, was born in Copenhagen in 1867. After qualifying as a physician in 1893, he worked for two years at the Physiological Institute under

Prof Christian Bohr, who did much to shape his subsequent career. At this institute he carried out studies on the physiology of respiration. After working in 1896 under Schmiedeberg at Strasbourg, Bock returned to Denmark where he studied at the University Pharmacological Institute in the period 1897-1900. He was only 33 years old when he was appointed professor of experimental pharmacology, and during the following decade he published a series of studies, many of which are still regarded as classics. In later years original research was, to a certain extent, set aside by the claims made on Bock as an administrator and organizer, and it was largely due to him that the school of dentistry, to which he was attached as a teacher, came to be reorganized. From 1907 to 1912 Bock was in charge of this school. In the period 1909-1939 he was adviser to the government in pharmacological problems, including forensic toxicology. Between the two world wars he undertook intensive research and educational studies of chemical warfare, and he did much to prepare the way for combating gas warfare. After his retirement as professor in 1938, Bock continued to live a very active life, and during the occupation of Denmark by the Germans he traveled widely, giving lectures on civil air defense. Painting and gardening were among his hobbies. In the summer of 1952 a motor car accident crippled him badly, and he was still suffering from its effects when he died early in 1953.

ITALY

Supracondylar Fractures of Humerus—Professor Sanzone read a paper on supracondylar fractures of the humerus at the meeting of the Medical and Surgical Society of Taranto, Jan 27. Describing this specific type of inferior epiphyseal fracture of the humerus that is characteristic of infancy, he discussed the progressive phases of this ossification in infancy and puberty. Among the various anatomic elements that contribute to the causation of the fracture are the epitrochlear muscles, especially the round pronator.

The modern method of reduction aims almost systematically at the closed reduction. Great consideration should be given to the technique of stretching the epitrochlear muscles so that the distal fragment may accomplish its anatomic alignment. The radiological picture is very important for differentiation from other types of local fractures.

Professor Sanzone said that the sequela of Volkmann's paralysis should not be ascribed to the system of immobilization used but rather to failure in reduction of the fracture. In making the circular plaster bandage, it is advisable to open the anterior groove soon after its solidification, making the fixation rely on the back splint. Functional restoration depends mainly on early reduction.

In the discussion that followed, Professor De Rosa said that use of the plaster bandage is not devoid of dangers if the topography of the fracture is considered. Therefore, he believes it is wise to hold the reduction at first with a temporary bandage that can later be transformed into a permanent bandage. As for closed reduction, Professor Buonsanti favors the maneuver of flexion of the forearm with leverage on the wedge of Lorenz. This technique, which consists of traction and countertraction, can be performed without any assistance. In the distention of the muscles the forearm is bent as much as possible to insure the greatest possible contact between the stumps and the formation of bone spurs by the diaphysary stump is avoided. These spurs can cause imperfect function because of para articular block. He also agreed on the necessity of early reduction of the fracture, since this is the only technique capable of assuring good results.

Medical and Surgical Society Meeting—On Dec 14, 1952, the medical and surgical society of the Romagna region held a meeting at which many papers were read.

Diaphragmatic Hernia—Drs Vazzocchi and Pezzani discussed diaphragmatic hernia. One case was presented, and the etiology, diagnosis, and therapy were discussed. Professor Sighinolfi said also that diaphragmatic hernia on the right side seems to be less common than on the left and that from

his personal experience he could recall only one case with hernia on the right. This patient was a child in whom a segment of the transverse colon had herniated into the thoracic cavity through a narrow hole in the right side of the diaphragm and had afterward become strangulated and gangrenous. The young patient died. In addition to the correct differentiation of diaphragmatic hernias as fetal and embryonal, with and without a hernial sac, respectively, one must keep in mind the possibility of an eventration in which the diaphragmatic muscle is distended and relaxed and has atrophic fibers.

Carcinoma of Ampulla of Vater—Drs Bazzocchi and Pezzani discussed also a rare case of carcinoma of the ampulla of Vater in a 25 year old man in whom the symptomatology had begun when he was 11 years old and who had a severe and obstinate form of icterus. The tumor was removed by the transduodenal approach and he has been clinically cured for many months.

Professor Sighinolfi, the chairman, intervened and, since the speakers had mentioned the finding of an obstructed gall bladder, he thought a note of comment was needed. He said that the failure of the gallbladder to fill up after oral administration of a contrast medium cannot be interpreted as indicating obstruction of the gallbladder. More reliable data may be obtained after administration, a few hours later, of twice as much contrast medium. X-ray examination of the gastrointestinal tract with accurate visualization of the duodenal loop is indispensable for a correct diagnosis. Dr Jasonni believed that the distension of the gallbladder in the case under discussion should be considered an important element in the differential diagnosis, it could make one reject the calculous nature of the syndrome and suspect its neoplastic nature.

Fractures of Clavicle—Professor Beluffi, from Pesaro, discussed open treatment of fractures of the clavicle. Since the closed methods of reduction and immobilization of the fractures of the clavicle are not well tolerated or give imperfect results and since, on the other hand, the modern methods of transskeletal traction require complex apparatus, he believes that in most cases of fracture of the clavicle open reduction should be used. The surgical treatment does not present technical difficulties nor dangers for the patient. It gives a perfect reduction in almost all cases. Moreover, it guarantees a solid and aesthetic callus with the best restoration of function. This method should be used not only in transverse fractures but also in oblique fractures where there is a third fragment. The fragment should never be removed but should be reduced to its proper place without damage to the muscle connections to avoid the danger of a pseudoarthrosis. The surgical technique should be individualized to the anatomic lesions of each case. In most cases the suture or cerclage with chromic surgical suture, nylon, or metal wire is sufficient. Fixation with Kirschner wire is indicated in some cases and is a good method, in some instances Professor Beluffi obtained favorable results with osteosynthesis with small pieces of vitallium.

In the discussion that followed, Professor Borellini agreed with Professor Beluffi that no closed orthopedic treatment gives a perfect reduction of some fractures of the clavicle. Among the closed methods the skeletal traction according to the technique of Filippi deserves special mention, since it gives good anatomic and functional results. As for open reduction, he believes that the best method is fixation by the retrograde intramedullary approach with Kirschner wire.

Professor Sighinolfi observed that most sequelae of fracture of the clavicle occur in patients treated by physicians working for accident insurance companies. As a rule, however, the residual deformities do not markedly affect function. In the reductions that he obtained by means of cerclage with a silver wire, there was sometimes delayed formation of bone callus, in other cases there was instead abundant callus formation. He obtained very good reductions with the apparatus that was proposed by Cornacchia.

Prostatectomy Techniques—Interesting papers on the various methods of prostatectomy were read. Dr Buccì discussed the indications for prostatectomy by Hryntschak's method, although he did not minimize the advantage of Millin's technique.

Professor Bazzocchi thought that the criticism against Millin's method that a suppuration of Retzius' space may occur is unsound, since by this route even an acute prostatic abscess can be checked. Nevertheless, the possibilities and the good results of the transvesical approach should not be underestimated.

Professor Babini reported that he had performed many prostatectomies according to Millin's method, but had now reverted to Freyer's one stage method. The patients have recovered in almost the same length of time. He does not emphasize the danger of hemorrhage because he has never had an alarming case of hemorrhage, although he does not pack the cavity left by prostatectomy.

Professor Beluffi observed that for some time there has been an increasing criticism of retropubic extravesical prostatectomy by Millin's technique and a return to one stage transvesical prostatectomy. The method proposed by Hryntschak and described by Bucci is a variant of this. He has never used it and therefore does not know its advantages, but for some time his former enthusiasm for Millin's method has been decreasing and he has restricted its use in favor of transvesical methods. Of these, he prefers the one described by Mingazzini.

Bronchial Tumors—Professor Sighinolfi discussed some clinical and roentgenologic aspects of bronchial tumors. First, he reported some cases of pulmonary tumors, from which he showed serial roentgenograms that demonstrated their slow evolution. Two of the tumors deceived him because the initial radiological manifestations could have been interpreted as localized tuberculous processes. Three other cases were interesting because of a picture of atelectasis caused by the initial localization of the tumor in the main bronchus. In two cases the cancer was demonstrated directly by bronchography, in one case good results were obtained with early operation. In the third case, in which the roentgenograms indicated atelectasis of the lower lobe, bronchoscopy revealed a circumscribed mass that partially occluded the lumen of the bronchus of the lower lobe of the right lung and that was diagnosed as Jackson's adenoma. Diathermic coagulation of the lesion gave such good results that the patient's condition returned to normal.

The discussion confirmed the difficulty of a correct diagnosis, which is sometimes impossible. In view of the statistical data concerning the undoubted increase in the rate of pulmonary tumors, every effort should be made to obtain as soon as possible a correct diagnosis so that the latest surgical techniques may be used successfully.

MEXICO

Influenza Epidemic in Mexico.—The world wide epidemic of influenza of 1919 included Mexico, where a great number of persons were affected. There was a high mortality rate and a high incidence of neurological complications of the meso-encephalic type. The epidemic was severer in certain geographic areas such as the state of Michoacán. Since then no true cases of influenza had been observed in Mexico until January of this year, when, concurrently with the European and North American epidemics, an outbreak occurred. The epidemic was concentrated mainly in the large cities such as Mexico City, Guadalajara, Puebla, Monterrey, San Luis Potosí, and León. Undoubtedly the incidence was highest in Mexico City, where at least a third of its 3 million inhabitants were affected.

In contrast to the 1919 epidemic, however, the 1953 outbreak was noted for its mildness. There were no deaths directly attributable to it, and hemorrhagic manifestations, which were very common in 1919, occurred infrequently, with epistaxis being observed in a few cases. Finally, another sign of the mildness of the epidemic was its short duration, since it had disappeared completely at the end of five weeks.

The Department of Public Health, in its hospitals and other medical attention centers, and the Seguro Social (Department of Social Security for Workers) put into practice every measure

available to decrease the severity of the epidemic. Antibiotics were distributed free of charge to many patients with complications. The following recommendations were made: 1 Patients should be isolated during the acute period. 2 They must not resume ordinary activities until the danger of complications have disappeared. 3 Nose and throat exudates of the patients, as well as all objects contaminated by their excretions, should be disinfected. 4 Crowded places should be avoided as much as possible. 5 Concentration of patients in homes, hospitals, or other institutions, for medical care should be avoided, in order to prevent the appearance of complications, particularly pneumonia. 6 As a general recommendation, it is better for the patients to be under medical care with adequate nourishment.

Second Assembly of Universities.—The second assembly of Mexican universities took place last February, in the colonial city of Guanajuato. Twelve universities and 14 institutions of higher learning were represented, most of them by their rectors, presidents, or directors. The rector of the National University of Mexico was elected president of the assembly and the rector of the University of Guanajuato, which was the host institution, vice president. The following general decisions were made at the meeting: (a) Every candidate to the preparatory schools (which correspond to the last year of high school and to the first of college of the North American system) will be subjected to a preliminary (selective) examination, and admission will be granted only when the results meet certain requirements. (b) To date the program of the preparatory schools has varied according to the type of professional studies chosen by the student, which means that he has been compelled to choose his profession when he entered preparatory school. It was decided that there will be a single program for the preparatory schools that will be followed by all students, without regard to the professional studies they follow afterwards. (c) A preliminary proposal was made to extend the preparatory school course to three years, adding one year to the present curriculum. (d) To a certain extent the courses of the preparatory schools will also be unified. They will be of four types: (1) courses in the sciences and humanities, (2) courses in aesthetic culture, (3) training activities and (4) nonacademic activities. There will also be some elective courses. Several commissions were formed to continue the study, on a permanent basis, of diverse problems that became evident in the course of the discussions and to prepare the agenda of the next assembly of universities.

Congress of Tuberculosis and Silicosis.—The Fifth National Congress of Tuberculosis and Silicosis was formally inaugurated on Jan 25 in Guadalajara, at the auditorium of the medical school. The meeting, which was organized by the Sociedad Mexicana de Estudios sobre Tuberculosis y Enfermedades del Aparato Respiratorio (Mexican Society of Studies on Tuberculosis and Respiratory Diseases), was attended by more than 200 delegates from Mexico and other countries, including such distinguished international specialists as Drs Maxwell Chamberlain, Oscar Auerbach, and Leo Eloesser.

The inaugural lecture by Dr Alfonso Aldama y Contreras was entitled "The Minimum Program for the Campaign Against Tuberculosis in Mexico." The following papers were read in the plenary sessions: "A Critical Evaluation of the Economic-Social Protection of the Tuberculous Patient in Our Country," by Dr Ismael Cossio Villegas and colleagues. "Incidence of Silicosis in Mexico," by Dr Ventura Aguirre of the Medical Department of the Secretary of Labor and Social Security, "A Study of Circulation in the Lungs in Silicosis," by Dr Enrique Staines and co-workers, "Present Status of Surgical Treatment for Pulmonary Tuberculosis," by Dr Alberto Ladrón de Guevara and co-workers, "Present Status of Medical Treatment for Pulmonary Tuberculosis," by Dr Rodolfo Limón and co-workers, "Congenital Lung Diseases," by José Nava González, "Present Status of Cardiovascular Surgery in Mexico," by Dr Clemente Robles, and "Cystic Lung Disease and Associated Pathological Changes," by Dr Roberto Mendiola. Finally, Dr Pedro Alegría, president of the meeting, insisted that the federal government should be responsible for every problem related to the campaign against tuberculosis in Mexico and suggested that special institutions be created for that purpose.

CORRESPONDENCE

ERRORS IN LABORATORY PROCEDURES

To the Editor—Surveys of laboratory accuracy (Shuey, H. E., and Cebel, J. *Bull. U. S. Army M. Dept.* 9799, 1949) have given adequate proof that too many laboratory reports are in such gross error that they are not only misleading but, at times, a cause of serious errors. It is not our purpose to delve into the whys and wherefores of such conditions but, rather, to discuss the fact that, assuming every laboratory procedure were perfectly performed, there would still be error. If this error were small enough to be unimportant in every instance then it would be of academic interest. Unfortunately, however, in many instances this error is larger than might be desired, because, through no fault of the laboratory, it is beyond reasonable control. This being the case it behooves the physician to gain at least a superficial understanding of the problems involved.

In measuring a discontinuous variable (the number of deaths occurring in a certain number of cases of smallpox), if it is assumed that the actual cause of death in each case was smallpox and that we can count correctly then there can be no error in measurement, for deaths can only occur in discrete intervals of 1, 2, 3, 4. Continuous variables, on the other hand, do not add values at discrete intervals but, rather,

can add an infinite number of values. The measurement of continuous variables is always subject to error; it is impossible to obtain an exact measurement of this type. It is impossible, therefore, to determine the exact value of a blood glucose level and, in this sense, all clinical laboratory procedures that measure continuous variables are in error. This error is relative and is important only when it becomes too large. For example, it is theoretically possible to measure a blood glucose level so accurately that it could be expressed as 100.345 mg per 100 cc, with the knowledge that the last significant figure may be in error by as much as one unit. It is improbable that anyone would care very much about such accuracy. It would be of some concern to the physician, however, if he were told that a reported value of 100 mg per 100 cc might be off as much as 50 mg per 100 cc.

It is important at this point to distinguish between the terms accuracy and precision as they are used in the modern statistical approach. A test is considered accurate if it gives a true result. For example, the Folin-Wu method of blood glucose determination is not very accurate, since a result of 100 mg per 100 cc contains approximately 20 mg of reducing substances other than glucose per 100 cc. Certain other available methods are more accurate because most of the extraneous reducing substances are not measured. This does not mean, however, that a relatively inaccurate test is necessarily of no

value to the clinician. The reducing substances other than glucose measured in the Folin-Wu glucose method fluctuate relatively little, and the physician merely becomes accustomed to interpreting the results in the light of a false normal range. Precision, on the other hand, is probably of greater importance. It is the degree of variation or reproducibility of results obtained by a method, such as the scatter of results if many aliquots of one unknown are tested. The less the variation, the greater the precision is said to be. Accuracy and precision are completely independent of each other.

As an example of the variation of results obtained when a test is repeated on the same sample, the figure shows the distribution of the results of 30 analyses for blood sugar on a pooled blood sample, run by the Folin-Wu method.

The average of the results is 118.6 mg. per 100 cc. and is the best estimate available of the correct value for the method used. It is possible, by relatively simple statistical analysis, to determine limits on each side of this average that would include approximately 95% of all determinations made by the same laboratory on the particular unknown sample. These limits also represent an index of the precision of the method and can be expressed in terms of mg. per 100 cc. or in terms of per cent of the answer itself. In the example above, it was found that the precision of the Folin-Wu method at 120 mg. per 100 cc. was approximately ± 10 mg. per 100 cc., or $\pm 8.2\%$. It should be noted that these limits would encompass the correct answer in only approximately 95% of cases and, therefore, that one correct answer in 20 might fall outside these limits. A report of a blood glucose level of 106 mg. per 100 cc. does not mean that the exact level is actually 106; in fact, the probability is that it is not 106. What it does mean is that the correct answer for the method used is probably (95% confidence) within 10 mg. of the reported figure.

The same situation exists in all clinical chemical analyses. Ideally, all reports should be given with an indication of the error associated with them. Perhaps this would be rather impractical in clinical medicine, although this procedure is gaining favor, but it is important that physicians think in these terms. Error is critically important to the physician only when it becomes too large. The control of error within clinically permissible limits is the responsibility of the laboratory. This is not always a simple task. In most chemical tests an error of $\pm 10\%$ is not critical, but certain exceptions exist. It is difficult, for example, to perform a calcium determination on serum by most of the procedures in use with an error less than $\pm 5\%$. This means that the true value of a reported result of 9 mg. per 100 cc. may lie anywhere between 8.5 and 9.5 mg. per 100 cc. This is not the fault of the laboratory.

There are a number of factors that contribute to this unavoidable error. Every step in a chemical procedure cannot be reproduced exactly and contributes its share of error to the total, over all error of the test. For example, among the sources of error in the Folin-Wu glucose determination are measuring the blood, measuring the reagents used in preparing the protein-free filtrate, measuring the protein-free filtrate, the copper reduction step, reading the color density, and the variation of the reagent blank (Henry, R. J., and others. *Am. J. Clin. Path.* 23:285, 1953). It is true that the over-all error can be reduced by more exacting technique in one or more of these steps. Reduction of the error at one or two steps, however, has relatively little effect on the over-all error. To reduce materially the error at all steps would involve considerably more work, which would increase the cost of the test to the patient. Actually, there would be little point in reducing error of a test that is already sufficiently precise for clinical purposes. In certain cases, however, in which greater precision is desirable, it is impractical or impossible at the present time to accomplish this.

In the field of hematology, the unavoidable errors are not sufficiently appreciated. A physician receives a report on an erythrocyte count of 3,800,000, places the patient on iron therapy, repeats the count a week later, and receives a report

of 3,400,000. At this point, the laboratory is apt to be blamed for poor work. Actually, the laboratory may well be correct in both counts, and, yet, the true counts may have been 3,400,000 and 3,800,000 respectively. The reason for this is that, if one follows the accepted technique of counting five 0.04 mm squares of a hemocytometer filled from one diluting pipette, the maximum unavoidable error in counting is $\pm 18\%$ (Berkson, J., Magath, R. B., and Hurn, M. *Am J Physiol* 128:304, 1940). A report of 3,800,000 erythrocytes per cubic millimeter of blood is not an actual count of cells in a cubic millimeter but a calculation based on a count of relatively few cells. This error is termed unavoidable since it is the error assuming no error in technique. The true count, in the instance in which 3,800,000 erythrocytes are reported, is probably between 3,100,000 and 4,500,000.

Nearly every procedure performed in the clinical laboratory could be discussed from the standpoint of unavoidable or permissible error. Our purpose is to call this type of error to the attention of the clinician so that he can interpret laboratory reports more intelligently.

TRANVESTISM

To the Editor—The issue of May 30, 1953, of *THE JOURNAL* (153:391, 1953) contains an article on the surgical treatment of transvestism by Hamburger and associates. The Danish authors describe the case of a male transvestite who considered himself, like many transvestites, 'the victim of a cruel mistake,' namely of being a female in a male body. The patient demanded a removal of the hated male organs, since otherwise life was not worth living and he would commit suicide. After prolonged, but psychiatrically not quite satisfactory examinations, the patient was castrated in three stages: (1) hormonal castration with estrogenic hormones, (2) orchidectomy, (3) amputation of the penis, implantation of the urethra into the perineum, and creation of labia like structures by plastic surgery of the scrotum.

Although the authors state that "it cannot be denied that onanism (transvestism) may be psychically conditioned," they proceeded with the surgical treatment and based this course of action on hypotheses of genetic (chromosomal) changes that allegedly create sex intergrades and are responsible for the psychic striving of the transvestite to be identified with and regarded as a woman.

Nothing in the preliminary physical and hormonal examination of this patient offers any convincing evidence that somatic, genetically determined factors played a predominant role in this case. The young man had testes somewhat under average size but of normal consistency. Secondary sexual characteristics were male. He was of the asthenic type with a feminine habitus. There are men of exactly the same habitus who do not show any sexual deviation and conversely many sexual deviates whose body type is fully masculine. It is not understandable how genetic, chromosomal changes would affect a person's psychic structure and emotional attitudes without any somatic changes of an "intergrade" nature. The acceptance of effeminate attitudes and mannerisms by some homosexuals and transvestites can be very well explained by the strong psychic drive to identify with a woman. How would we explain the presence of sexual deviation in men who neither in their body build nor in their behavior show the faintest trace of "intergrade" characteristics?

I do not wish to deny the presence of constitutional, hereditary factors in mental illness and in sexual perversions, however, we cannot assume that a specific genotype will produce a specific perversion such as homosexuality, fetishism, or transvestism. Psychiatric histories of sexual deviates show certain environmental factors that interfered with their normal psychosexual development and led to a specific perversion.

The psychiatric history of the patient as published in *THE JOURNAL* is very brief, and the patient's statements that he

never felt 'any deep affection' for his sister and that he had no 'exceptional feelings' for his parents are taken at face value. No attempts were made to elicit forgotten childhood memories with sodium amobarbital (Amytal) interviews or even to use projective psychological tests (e.g., Rorschach and Thematic Apperception Tests). These techniques would have shown much more than the patient was able to disclose in ordinary psychiatric interviews. From the history as given it seems this patient grew up in a vacuum. A deeper going psychiatric investigation, even without resorting to psychoanalysis, would have disclosed psychological and emotional factors that determined this patient's deviation from the normal psychosexual development. Contrary to the statement of Hamburger and associates, patients with transvestism were psychoanalyzed and a report of a case was published by Fenchel (*The Psychology of Transvestism, Internat J Psychoanalysis* 11:211, 1930). It is true that reports on the treatment of transvestites are scarce in the psychoanalytic and psychiatric literature. This is due to the extreme reluctance of transvestites as well as of other sexual deviates to undergo any treatment that actually would remove the perversion and deprive them of their perverse gratifications. The difficulty of getting the patient into psychiatric treatment should not lead us to compliance with the patient's demands, which are based on his sexual perversion.

Transvestites present the picture of an especially complex sexual deviation and show features of fetishism (overvaluation of female clothing), homosexuality (desire to be a woman), exhibitionism (desire to show themselves as a woman), and masochism. The patient reported on by the authors showed marked masochistic traits, as exemplified in his persistent demand to be castrated (a comparable observation was published by M. Grotjahn [*Transvestite Fantasy Expressed in a Drawing, Psychoanalyst Quart* 17:340, 1948]). We observe this as a symptom in some schizophrenics who at times will resort to self-mutilation be it self-castration, self-blinding, or some other form of serious self-inflicted injury. It would not be surprising if a closer investigation of this patient were to disclose the presence of an underlying schizophrenic process that has not become manifest in any other overt symptoms except for the insistent striving to be castrated. With all due respect for the surgical skill of Dr. Hamburger and his associates, one can hardly maintain that the psychiatric indication for this procedure was sound.

CHILDREN'S SHOES

To the Editor—Relative to the article 'Children's Shoes' by Louis Starr in *THE JOURNAL* (151:1401 [April 18] 1953), I would like to make the following comment. So far as the normal foot is concerned, either adult's or child's, the shoe is essentially a platform designed to protect the foot and to keep it off the ground. Although custom and style have determined certain changes, no shoe can be too large to fit properly. This, of course, becomes ridiculous if carried to the extreme, but the point is only a shoe that is small or that cramps or puts undue pressure on tender structures can fit poorly. As long as a youngster can wear his shoes easily and without tenderness at pressure points, his shoes fit. Persons with normal feet are comfortable in practically any shoe so long as it is large enough, those accustomed to tight fitting and poorly-designed shoes complain, initially, that adequate shoes "flop" but, after several weeks, become accustomed to the freedom of motion of the larger shoe. A large shoe is out of the question for women who wear high heels, since tightness of the shoe is necessary to keep the foot from sliding forward.

I think the normal child may be permitted to go barefoot as long as he does not endanger himself. I see no objection to healthy youngsters going barefoot but I do agree that youngsters in the house should not be permitted to wear slippers or to go barefoot during convalescence.

Simultaneous Traumatic Dislocation of Hip.—In an automobile collision a 38 year-old man sustained multiple wounds and abrasions, a posterior dislocation of the left hip, with small fractures of the posterior superior acetabular edge, and an anterior dislocation of the right hip with less extensive acetabular rim fracture Three unsuccessful attempts with the patient under general anesthetic, with the help of four assistants, were made to reduce the right hip by traction and manipulation The head of the femur could be brought to the acetabular edge but not slipped into the joint For the fourth attempt the patient was lowered on to the covered floor and there a reduction was accomplished Because of falling blood pressure and shock, reduction efforts on the left hip were

postponed A plaster of paris hip spica cast was applied covering the right leg completely and the left leg (hip still dislocated) to the knee This was to maintain the reduction of the right hip and to hold the left hip in status quo Eleven days after the accident the plaster encasement was removed Under general anesthesia, with every care not to rotate or flex the right thigh, he was again placed on the covered floor The posterior dislocation of the left hip was reduced by gentle but strong traction applied in the long axis of the leg, with counterpull and pressure on torso and pelvis, and followed by slow flexion and internal rotation of the left leg and thigh, accompanied by pushing-up pressure on the greater trochanter of the femur The patient was encased in a double body plaster of paris spica covering both legs, held in partial abduction and slightly flexed at the hip joints Six weeks later this cast was removed Two weeks after that the patient had good locomotion and only a slightly diminished tractile sensation on the outer side of the left foot Necrosis of the caput femoris did not follow this instance of simultaneous traumatic dislocation of both hips Fractures of the acetabular rims healed with no apparent blocking of hip joint motions up to six years after dislocation When shock exists, with bilateral dislocation of the hip, one side may be reduced at a time, with out too great an interval (10 days) Putting the patient in a position where one may apply one's utmost physical power under control is the wisest course in reducing dislocation of the hip The floor can be used Prolonged rest after reduction of hip dislocation with slowly increasing active motions of the hip and long delayed weight bearing favor a good prognosis.

Immunologic Mechanisms in Thrombocytopenic Purpura.—Tests performed on 35 patients between the ages of 2 and 71 with idiopathic thrombocytopenic purpura indicated that an immunologic mechanism is responsible for the low platelet count in many of these cases. Platelet agglutinins were demonstrated in vitro in the plasma of many of these patients, and a factor presumably identical to this platelet agglutinin proved capable of inducing thrombocytopenic purpura and altering megakaryocytes in normal subjects or patients with inoperable cancer who were transfused with 500 cc of whole blood or its plasma equivalent obtained from 26 patients with thrombocytopenic purpura. Splenectomy was performed in 28 of these patients, and 19 were treated with cortisone or corticotropin (ACTH). Remission following splenectomy was not necessarily accompanied by disappearance of the thrombocytopenic factor from the patient's plasma, but this factor did disappear in spontaneous remissions and in those induced by corticotropin or cortisone. Of 14 patients in whom evidence for increased platelet destruction was lacking, 11 were treated by splenectomy. Only one had a good response, and two were briefly benefited. It is suggested that idiopathic thrombocytopenic purpura may also arise from failure of megakaryocytes to produce circulating platelets. Reference was made to the existence of serologically different platelet types. A study was made of seven women who had had a total of 12 pregnancies in which either the mothers or the infants had purpura. Three of the mothers had platelet agglutinins in their plasma, all eight infants born to these three mothers had thrombocytopenic purpura and it is postulated that neonatal thrombocytopenia in these infants developed as a result of transmission across the placenta of maternal autoagglutinins for platelets. Two of the seven mothers were in apparently perfect state of health but gave birth to infants with thrombocytopenic purpura, isoagglutinins in the maternal serum for the infant's platelets were demonstrated in one case. It is suggested that neonatal thrombocytopenia was due to development of isoagglutinins because of fetal and maternal platelet incompatibilities. The remaining two mothers had severe thrombocytopenic purpura at the time of delivery, but had no platelet agglutinins in their plasma. The infants in both instances were normal. These two cases are considered to represent examples of maternal thrombocytopenia in which platelet agglutinins have played no part in pathogenesis, and consequently the infants' platelets were normal.

Cardiac Catheterization.—Venous catheterization of the right side of the heart and of the pulmonary artery according to Courmand and Ranges' technique was performed in 128 patients with heart disease with various etiological bases. Of these 128 patients, 15 adults are described in detail in whom cardiac catheterization was employed in diagnosis and man-

agement and found to be practical. As a result of his experience the author states that cardiac catheterization was most helpful in the diagnosis of left to-right shunts, such as patent ductus arteriosus, atrial septal defect, and ventricular septal defect. By means of hydraulic formulas, catheterization may aid in estimation of the degree of stenosis of various valves, e g, pulmonary, mitral and tricuspid valves. In the author's hands, the hydraulic formulas have not been satisfactory in estimating the size of the patent ductus arteriosus. By means of pressure curves in the right atrium and pulmonary 'capillary' pressure curves, the catheter may be of value in the diagnosis of the insufficiency of the tricuspid and mitral valves. The procedure may aid in the diagnosis of right ventricular failure by showing elevated pressure of the right ventricle at the end of the diastole and elevated right atrial mean pressure. The catheter may aid in the diagnosis of left ventricular failure by showing elevation of the pulmonary 'capillary' mean pressure and widening of the arteriovenous oxygen difference, if the failure is of the low output type. The catheter may aid in the diagnosis of high output failure, e g, in thyrotoxicosis, beriberi, systemic arteriovenous fistula, anemia, and Paget's disease of the bone. By means of characteristic right ventricular pressure curves the catheter may be helpful in the diagnosis of pericardial constriction and cardiac tamponade. Catheterization aids in the diagnosis of cor pulmonale in showing high pulmonary arterial pressure associated with normal pulmonary 'capillary' pressure and a tendency toward normal cardiac output. Pulmonary artery pressure may be expected to rise after digitalization in cor pulmonale with failure, and to fall after digitalization in left ventricular failure. By means of the determination of the oxygen saturation of the pulmonary 'capillary' blood, catheterization may be used to differentiate between arterial oxygen unsaturation due to emphysema and that due to right-to-left shunt.

Reiter's Syndrome.—Of 23 men between the ages of 21 and 41 years with Reiter's syndrome, 20 had urethritis, conjunctivitis, and arthritis, while the other 3 showed little evidence of either urethritis or conjunctivitis but did have arthritis and typical mucocutaneous lesions that were present in all 23 patients. Several small, erythematous papules often surmounted by a vesicle were observed on the prepuce and/or the glans penis in 18 of the 23 patients. After rupture of the vesicle, the ulcerated papule was covered by a purulent crust or a cornified layer. Occasionally erosion of the urethral meatus was present. An erythematous, weeping, eczematoid eruption of the scrotum and groin was seen in four patients. Vesicles surrounded by a zone of erythema, which soon ruptured leaving small ulcers, were observed on the palate or buccal mucosa in 11 patients. Five patients showed changes in fingernails and five in toenails, subungual hemorrhages, splitting of the nails into several opaque layers, and conversion of nails into thick, horny appendages were observed. Five patients had dermal lesions morphologically indistinguishable from those of keratoderma blennorrhagica, involving the genitalia, groins, perineum, buttocks, extensor surface of legs, knees, elbows, soles of the feet, axillae, and scalp. Vesicular and papular lesions in the skin and mucous membranes were so common in the authors' series as to aid in the diagnosis of doubtful cases. The arthritis was prolonged in duration but rarely produced permanent deformity. Fourteen patients admitted a recent extramarital sexual experience before the onset of their disease. One patient was observed during two episodes of Reiter's syndrome, the second episode beginning six months after cessation of the first. In each instance this patient admitted extramarital sexual experience with the same woman about one week before the onset of his disease. In 14 of the 23 patients, the first symptom was urethritis. These data suggest that the disease may be due to a venereal infection, with the urethra as the portal of entry. Bacteriological and serologic studies demonstrated active gonococcal infection in only one of the 23 patients. Pleuropneumonia-like organisms were isolated from the urethral exudate in only one of the eight patients examined. Fecal cultures in five patients with diarrhea failed to show *Shigella* or other bacterial pathogens. The cause of Reiter's syndrome

remains in doubt. The most effective therapeutic measures were rest, high-caloric diets, salicylates for pain, and intensive physical therapy. Streptomycin seemed to produce slight improvement in four of six patients. Cortisone and corticotropin (ACTH) caused a temporary decrease in fever and arthritis of a few patients.

Trauma as a Cocarcinogen in an Oil Worker.—The 60-year-old man whose case is presented had been employed by a petroleum corporation for 30 years. His work involved frequent skin contamination by a moderately heavy refined oil used in transformers and electrical motors. Physical examination revealed a tumor mass, 1.7 cm in diameter, extending 3 to 4 mm above the skin surface over the dorsum of the third right metacarpal. One month before, the patient had cut the dorsum of his right hand at the site of the present tumor. The wound healed slowly, and working resulted in minor abrasions to the overlying eschar. Two weeks prior to entry, a severe blow was received on the injury site, and following this the tumor appeared and grew rapidly. It was removed

by excision, and microscopic examination revealed a grade 1 squamous cell carcinoma. The concept of "sensitization" or "preparation" of skin by means of suboptimal exposure to carcinogenic hydrocarbons has been experimentally established by several investigators. The suboptimal exposure converts some of the cells in the skin of experimental animals to a preneoplastic condition. Following this stage, nonspecific agents such as wound healing, freezing with carbon dioxide snow, croton oil, and mechanical irritation convert the process to true neoplasia. In this patient occupational exposure to petroleum products presumably served as the initiating mechanism, and the wound healing following trauma as the promoting agent.

Aureomycin and Nitrogen Mustard in Human Cancer.—Regional intra arterial administration of the nitrogen mustard (methylbis[2-chloroethyl] amine hydrochloride) has been found to produce on certain cancers therapeutic effects that could not be achieved by intravenous administration. Serious systemic infection occurred, however, in several patients who were given daily doses of the nitrogen mustard through an indwelling arterial cannula. The source of infection in these cases was either the arterial cannula tract or the devitalized tumor tissue. To prevent such systemic infection, prophylactic use of a broad spectrum antibiotic such as aureomycin was considered desirable. The indwelling cannula offered a safe route of administration of aureomycin hydrochloride buffered with sodium glycinate (buffered aureomycin). Furthermore, reports that high concentrations of aureomycin affected rapidly dividing cells in tissue culture, in plants, and in animal tumors suggested that this drug might also be a chemotherapeutic agent active against cancer. This was further supported by the observation that simultaneous exposure of cells in tissue culture to nitrogen mustard and buffered aureomycin was more cytotoxic than exposure to the same concentration of either drug alone. For these reasons, nitrogen mustard and buffered aureomycin were administered intra arterially to 17 patients with hopeless cancer. The tumors regressed enough to permit surgical excision in four patients previously considered inoperable, one refused operation.

Multiple Arsenical Cancers of Skin and Internal Organs.—Sommers and McManus review 27 cases of arsenical cancer in 19 men and 8 women. Twelve had been treated for psoriasis with Fowler's (potassium arsenite) solution, one had received injections of arsenicals because of syphilis, two had had occupational exposure to arsenical sprays, and in four others occupational exposure seemed possible. Seven had been treated with arsenic for swollen lymph nodes, burns, dermatitis, or chorea. In three, the form of exposure was unknown. The arsenical origin was recognized clinically in all except one of the cases by the characteristic multiple keratoses of palms and soles. In addition to the large number and extent of multiple skin cancers, four of the six patients who came to autopsy had additional internal cancers, three at multiple sites. These visceral lesions were in the bladder, prostate, esophagus, colon, kidney, and chest wall. In five other patients who died, death was ascribed to cancer of the tonsil, esophagus, breast, pancreas, and lung. One patient with multiple skin cancers and lung cancer is living. Some skin lesions apparently developed from the epidermis, sweat, or sebaceous glands, and possibly hair follicles. Gradations of epidermal atrophy, hyperplasia, precancerous changes, carcinoma in situ (Bowen's disease), and invasive cancers were observed. The visceral cancers suggest that a second predisposed tissue is the squamous epithelium of the mouth and esophagus and the metaplastic squamous epithelium of the respiratory tract. The third region of predilection is the urogenital epithelium of the kidney, ureter, and urinary bladder. Heredity, chronic irritation, local sensitivity, and endocrine abnormalities may favor arsenical carcinogenesis. Present knowledge of the biochemical effects of arsenic suggest that it influences hydrogen transport, nucleoprotein metabolism, and phosphorylation. It acts mainly on the nucleus and interferes with mitosis. The consequences are visible cytologically as disturbed epithelial growth and delayed maturation, particularly in epidermal nuclei. Mechanical stimuli, roentgen rays, and hormonal imbalances may have additional carcinogenic effects.

Critical Evaluation of Chemotherapy of Cancer—In summarizing the present status of the chemotherapy of cancer, Gellhorn classifies the substances used according to their mode of action into three groups (1) those producing an unfavorable environment for the cancer cell, (2) those modifying the systemic intoxication produced by cancer, and (3) those that damage the cellular functions. With the exception of the hormones, the chemical compounds that are used have significant toxicity for normal as well as for neoplastic cells. This precludes curative therapy, since the treatment necessary for destruction of the tumor would be lethal to the host also. Another limitation is the small number of tumor types that respond to drugs. Urethane, the folic acid antagonists, cortisone and the nitrogen mustards play a role in the treatment of the malignant lymphomas and leukemias which constitute only a small fraction of all the malignant neoplastic diseases. The empirical approach has largely consisted of screening chemical compounds for their effect on the growth of transplantable tumors in mice, rats, and rabbits. It must be recognized, however, that, with the possible exception of mouse leukemia, there is no evidence to demonstrate that transplantable or spontaneous tumors in laboratory animals are biologically directly comparable to human tumors. One apparent discrepancy between experimental and human tumors is in their relative growth rates. The cells of experimental tumors divide rapidly, and at any instant the majority of them are in an active phase of division. Human epithelial tumors grow relatively slowly, and morphological evidence indicates that only a small fraction of the cells are in active mitosis at one time. Since it is likely that cancer chemotherapeutic agents, like antibacterial drugs, can only destroy cells that are susceptible by virtue of active metabolism and division, it follows that effective drugs against human epithelial tumors will have to be administered and tolerated for long periods by the normal host cells. It may be significant that the drugs that are active in the currently employed animal tumor screening tests are effective principally against the most rapidly growing human tumors, the lymphomas and leukemias. The question is whether the screening techniques are missing compounds that are potentially useful against other tumors. The author suggests that more subtle end points than the ones now in use might indicate chemical compounds, that although they fail to produce dramatic changes in tumor growth after brief administration, might modify the growth of tumors when given over long periods.

Management of Shock in Acute Myocardial Infarction—Approximately half the patients with severe shock complicating myocardial infarction can be saved by active therapy with vasopressor drugs, blood, and plasma. The duration of shock without treatment is an important diagnostic criterion, because recovery is extremely rare when profound circulatory failure has persisted for a number of hours. Irreversible myocardial lesions are sustained when the injured myocardium undergoes a period of greatly reduced blood flow. Therapy designed to maintain the circulation at a level compatible with life will limit or prevent progressive myocardial deterioration and will enable a heart that is capable of recovery to resume adequate functioning. Thirty-two patients whose shock was so profound at the beginning of treatment that no hope of survival was justified were given active therapy with a combination of blood, plasma, and a vasopressor drug, 14 recovered, indicating that, however severe their shock, patients with acute myocardial infarction have a chance for life. The longer the patient remains alive under treatment, the greater his chances of recovery become. Some of the patients in this series recovered after long periods of deep shock, one did not definitely emerge from shock until the end of 48 hours of treatment. Pulmonary edema is a particularly unfavorable complication, experience in this series indicates that the best results when pulmonary edema is present are obtained by combating the shock. The four patients with this complication who survived received no therapy directed toward the edema other than small doses of morphine, but they showed impressive clearing of the lungs as the blood pressure rose and they emerged from shock. Clinical recovery from circulatory failure in the 14 survivors was associated with attainment of a pulse pressure of at least 25 mm Hg. Treatment should be continued under the close attention of physicians until the emergency is over, nurses cannot be given the responsibility of making the many decisions required by the fluctuating condition of the patient.

Dibucaine Hydrochloride and Phenobarbital Sodium in Ventricular Tachycardia—Dibucaine (Nupercaine) hydrochloride was administered intravenously by slow injection or constant venoclysis to 22 dogs with ventricular tachycardia accompanying myocardial infarction. The dogs were divided into four groups. Group 1 received dibucaine alone. Group 2 received dibucaine in addition to 3 or 5 mg of morphine per

kilogram of body weight Group 3 received phenobarbital sodium, 25 or 40 mg per kilogram, as well as dibucaine Group 4 received dibucaine in addition to pentobarbital sodium, 10 or 15 mg. per kilogram Dibucaine alone was effective in suppressing ectopic activity, but vomiting and convulsive movements commonly occurred and interfered with administration in some animals Administration of morphine before dibucaine was given prevented vomiting but did not prevent convulsive movements, and the ectopic impulse suppressor action was neither enhanced nor prolonged Vomiting was also eliminated when phenobarbital was given before dibucaine, and only mild stretching movements of doubtful cause occurred in two of nine dogs during the tests Phenobarbital enhanced and greatly prolonged the ectopic impulse suppressor effect of the dibucaine Pentobarbital sodium eliminated vomiting and convulsive movements and enhanced the ectopic impulse suppressor effect of dibucaine without prolonging it The blood pressure tended to rise or to remain constant in all slow administration tests, and there were only minor alterations in the P-R and QRS intervals in the electrocardiogram, rapid administration produced periods of prolonged QRS deflections and hypotension Discontinuance of rapid infusion was followed by a return of all signs to normal within 30 seconds There were no deaths in any of the groups A combination of phenobarbital and dibucaine is regarded as an effective and relatively safe treatment for ventricular tachycardia accompanying myocardial infarction when suitable precautions are observed

Methantheline (Banthine) Therapy of Enuresis.—After defining enuresis as repeated involuntary micturition after the age of 3, O'Malley and Owens review the neurophysiology of the bladder in order to show the rationale of methantheline (Banthine) therapy It has been demonstrated that methantheline suppresses the pelvic nerve stimulation of the bladder For this reason methantheline has been used to treat irritable bladders, cystitis, and interstitial cystitis with ulceration (Hunner's ulcer) Since it is believed that the bladder of the enuretic patient is irritable, with a tendency toward uninhibited contractions, the authors decided to use methantheline to treat enuresis By inhibition of the local reflex with methantheline, the bladder will gain more capacity and accommodate a larger volume without an increase in intravesical pressure In this way, in spite of poor cerebral inhibition, adequate inhibition will be maintained at the reflex level Two cases of enuresis treated with methantheline are reported in detail and nine more are charted The ages of the patients ranged from 5 to 15 Methantheline was given at bed time In one patient 25 mg. produced no significant improvement, but 50 mg. was temporarily effective After a relapse, 75 mg. was given and the symptoms subsided In the second patient 50 mg. of methan

theline with phenobarbital and limitation of fluids for one hour before bed time produced immediate relief of enuresis. Relapse occurred in only 3 of the 11 patients, and by increase of the dose, the enuresis was overcome and continence was maintained.

Cerebral Complications of Serum Sickness.—Two types of central nervous system involvement occur in serum sickness, peripheral and central. The entity referred to as serum neuritis is the commonest peripheral lesion. Isolated lesions of the cranial nerves have been described. A more generalized polyneuritis, which resembles that of acute infectious polyneuritis or the Guillain Barré syndrome, and even acute ascending paralysis of the Landry type also may be seen with serum sickness. No instances of purely spinal lesions with paraplegic signs are on record, although in some cases of generalized polyneuritis accompanying serum sickness, pyramidal tract signs and sensory disturbance corresponding with a definite spinal level suggested the presence of some lesion of the spinal cord. The frequency of cerebral injury in serum sickness is difficult to know. After describing a case of Windorfer's "neuro-allergic encephalitis," the authors say that the rarest manifestation of nervous system damage in serum sickness is focal cerebral injury. Two patients observed in the past year with focal brain damage following injection of serum are described. The first patient became very drowsy seven days after receiving antitetanus serum and on the eighth day awoke with an urticarial eruption over the face, arms, and trunk. A few hours later, he suddenly became unconscious and was semicomatose over the next 48 hours. On the 11th day after injection he regained consciousness, but had a complete right hemiplegia, aphasia, hemianesthesia, and homonymous hemianopsia. Six weeks following the injection of the serum he was hospitalized for investigation and custodial care. He had regained some power in the right leg, but was still unable to move the right upper limb, and was aphasic, with the field defect persisting. In the second patient the cerebral damage was of similar nature, but was much milder in degree, with a reasonably good functional recovery and little residual change. These cases are comparable in every way to nine previously reported in the literature. The authors speculate on the nature of the lesions in these patients and say that the reported cases of allergic encephalitis, myelitis and neuritis with serum sickness show considerable similarity to the nervous system reactions of acute virus exanthema, infectious mononucleosis, and collagen diseases.

Sensitivity to Tubocurarine and Decamethonium in Myasthenia Gravis.—The purpose of the experiments described here was to determine and compare equipotent doses of tubocurarine and decamethonium in normal subjects and in patients with myasthenia gravis. It was hoped that by interpretation of the effects of these agents in the light of the difference in their mode of action at the neuromuscular junction, some insight might be gained into the abnormal physiology in myasthenia gravis. Threshold paralytic doses of tubocurarine and decamethonium were determined in 30 patients with myasthenia gravis and in 22 nonmyasthenic subjects. Patients with myasthenia gravis (mean threshold dose 5.42 μ g per kilogram of body weight) were 5.5 times as sensitive to tubocurarine as were nonmyasthenic subjects (mean threshold dose 24.77 μ g

per kilogram). About 3 to 4% of normal subjects are as sensitive to tubocurarine as an average patient with myasthenia gravis, and about 3 to 4% of patients with myasthenia gravis are not abnormally sensitive to threshold doses of tubocurarine. Patients with myasthenia gravis were not more sensitive to decamethonium than were nonmyasthenic subjects. With subthreshold doses of decamethonium, patients experienced transient amelioration of signs and symptoms. Results obtained are consistent with the concept that the fundamental feature of myasthenia gravis is a blockade of the neuromuscular junction by a substance or process that decreases the muscular response to acetylcholine.

Effect of Edrophonium in Myasthenia Gravis.—Edrophonium (Tensilon) chloride is one of the quaternary ammonium salts that exert a stimulatory effect on the neuromuscular junction. It is capable of antagonizing the neuromuscular blockade produced by *d*-tubocurarine. The organic phosphates, such as tetraethylpyrophosphate, act only by their anticholinesterase effect; neostigmine has both a direct stimulating effect at the myoneural junction and an anticholinesterase effect, and edrophonium acts primarily by direct stimulation at the myoneural junction and only secondarily as an anticholinesterase agent. Thirteen patients with myasthenia gravis and four controls were given intravenous injections of 10 or 15 mg of edrophonium; three received additional doses orally, while one patient also received intramuscular injection of the drug. Increase in strength began within 30 seconds after intravenous administration, or as soon as it could be tested, and increased to a maximum within 1 to 10 minutes. The effect began to decline after 10 minutes, but there was a secondary rise of lesser degree. The effect of the injection lasted less than one hour in most patients. Grip strength increased from 90 to a maximum of 200 lb in the patients with myasthenia gravis. Clinical improvement correlated favorably with this and was sometimes spectacular. Side-effects were mild. No patient with myasthenia gravis had fasciculations, though the control group did experience them. There was improvement in strength regardless of the previous medication, but the increase seemed to be greater in those who previously took tetraethylpyrophosphate than in those who were receiving neostigmine. The control subjects also experienced a prompt increase in strength, even though it was of small magnitude. The secondary rise noted in most tests may represent the minor anticholinesterase action of the drug. After intramuscular injection of edrophonium, the response became apparent within 10 minutes, attained the maximum in about an hour, and then declined over a period of three to five hours. Strength was fairly well maintained by injections of 50 mg every three to four hours. Reactions to the intramuscular medication were minimal. A measurable increase in strength resulted also from the oral administration of 50 to 250 mg doses. The effect began within 30 to 60 minutes and lasted several hours. The patient discontinued the oral medication because of headaches. The authors conclude that edrophonium seems to offer a new approach to the study of myasthenia gravis, based on pharmacological action unrelated to anticholinesterase activity.

- Cholesterol and Cystic Duct Obstruction in Pathogenesis of Gall Stones J. M. Roberts—p. 208

Selection of Patients for Mitral Commissurotomy.—According to Bruce and co-workers, commissurotomy should not be done simply because a patient has a characteristic murmur of mitral stenosis on auscultation. The following four point program has been employed by the authors for selection of patients for mitral commissurotomy: 1. Accurate clinical diagnosis of mitral stenosis must be made. Usually percussion or chest x-ray examination demonstrates that the left border of the heart is straightened due to enlargement of the pulmonary

conus, artery, and left auricle The first heart sound at the apex and the second sound at the base to the left of the sternum are accentuated There are variable murmurs, such as mid- and late-diastolic murmurs at the apex, an occasional systolic murmur at the left sternal border (arising from the pulmonary artery), as well as an early diastolic murmur of pulmonary insufficiency (Graham Steell murmur) Murmurs may vary with posture, arrhythmias, respiration, and fibrotic and calcific changes in the mitral valve Demonstration of the moving calcified valve shadow during fluoroscopy is confirmatory 2 Clinical evidence of need for surgery depends on symptoms of pulmonary engorgement and diminished working capacity Cardinal symptoms are dyspnea, orthopnea, cough, and hemoptysis Fatigue is the earliest evidence of decreased working capacity, inability to perform the customary daily activities is a more advanced sign, and clinically apparent heart failure is a far advanced sign In the absence of these indications for commissurotomy, surgical intervention for mitral stenosis is justified in a woman of the childbearing age with a history of congestive heart failure during pregnancy, or in a patient with a history of repeated arterial emboli who is likely to have a recurrence that might cause a serious, or even fatal complication, and in whom auricular appendectomy is proposed prophylactically 3 Clinical contraindications to mitral commissurotomy are recent and uncontrolled acute rheumatic fever, subacute bacterial endocarditis, intractable heart failure, or the presence of pronounced aortic stenosis, mitral insufficiency, left ventricular enlargement, or left axis deviation of the electrocardiogram 4 The decision to intervene surgically also depends on the optimal time for commissurotomy When there is virtually no risk from operation, there is usually no need for it, on the contrary, when the need is greatest, the risk is also maximal Then appropriate laboratory tests may provide quantitative data that will aid the physician in making this important decision Much can be learned from clinical evaluation of symptoms and signs, chest fluoroscopy, pulmonary function studies, and phonocardiography Although cardiac catheterization provides considerable information regarding intracardiac and pulmonary hemodynamics, more practical information that aids the clinical management of these patients has been obtained from serial exercise tolerance tests By the latter technique, it has been possible to evaluate quantitatively not only the need and the optimal time for surgery but also the degree of improvement following operation

Magnesium Sulfate in Acute Glomerulonephritis—Magnesium sulfate has been used extensively in the therapy of acute glomerulonephritis in children The few studies of the mode of action of the drug demonstrated that the magnesium ion is responsible for the beneficial effects on the hypertension and encephalopathy The studies described here aimed to determine the effect of magnesium sulfate on the renal dynamics of normal children and of those in the hypertensive and convalescent phases of acute nephritis Inulin and sodium para-amino hippurate clearances were used as indicators of the glomerular filtration rate and of effective renal plasma flow Magnesium caused no changes in the renal function of normal children, but in children with acute nephritis, the glomerular filtration rate and effective renal plasma flow were markedly subnormal during the hypertensive stage and increased toward normal during convalescence The intravenous administration of magnesium sulfate caused marked rises in the glomerular filtration rate and in effective renal plasma flow when given during

the hypertensive stage Magnesium produced smaller rises in effective renal plasma flow but no changes in the glomerular filtration rate when given during convalescence The implications of these findings are discussed It is suggested that renal vasospasm is present in children with acute glomerulonephritis and that adequate therapy with magnesium sulfate relaxes this vasospasm

Gross Visual Defects Due to Retrolental Fibroplasia—The incidence of gross visual defects due to retrolental fibroplasia was studied among infants born during 1948 and 1949 to residents of New York State, exclusive of New York City Since it was not feasible to study all of the nearly 300,000 infants, only those whose birth weights were less than 2,000 gm. and who survived to the age of 4 months were selected for study Questionnaires were sent to the mothers of the selected infants Information was obtained on 3,377 infants, or 92.1% of the 3,667 selected for study A total of 50 cases of gross visual defects due to retrolental fibroplasia was found The incidence rates decreased from 15.9% in the birth weight group under 1,000 gm to 4.3% in the 1,000 to 1,499 gm group, and 0.7% in the 1,500 to 1,999 gm group The infants reported as having the shortest periods of gestation were found to have the highest incidence, the rate in the group with a period of gestation under seven months being 7.6% as compared with a rate of 0.3% in the group whose gestation period was reported as eight months or more The incidence of gross visual defects was not related to the occurrence of complications during the mother's pregnancy The incidence was slightly higher in males than in females, and also slightly higher in the infants of mothers over 30 years of age

Clinical Diagnosis of Endocardial Fibrosis—Endocardial fibrosis (also termed endocardial sclerosis and endocardial fibroelastosis) is now recognized as a pathological entity occurring in infants and having a grave, if not universally fatal, prognosis Previous publications have dealt chiefly with the morphological aspects, the possible cause, and the mechanism of cardiac failure It has been differentiated as a pathological entity from the group of diseases termed idiopathic cardiac hypertrophy The purpose of this communication is to discuss the diagnostic possibilities and to describe four cases seen by the authors in the past two years Evidence is presented that indicates that endocardial fibrosis is a relatively common cause of death from heart disease in infancy and that a presumptive diagnosis of this condition can often be made during life The salient features are age under one year, marked dyspnea without persistent cyanosis, absence of a loud cardiac murmur on repeated examinations, enlargement of the heart, presence of femoral pulsations, and electrocardiographic evidence of left ventricular hypertrophy in the precordial leads The chief conditions to be considered in the differential diagnosis are aberrant coronary artery, interstitial myocarditis, and glycogen storage disease of the heart, all of which are much less frequent as proved by necropsy studies In two of the four cases described here, the diagnosis was made before death

Curling of the Esophagus.—The condition referred to here as curling of the esophagus has been referred to also as pseudo-diverticulum, segmental spasm, spastic pseudodiverticula, functional diverticula, spasmodic stricture, and diffuse spasm of the lower half of the esophagus. Roentgenograms made at the right moment show that the esophagus has a corkscrew or coiled appearance. When the patient swallows barium under the fluoroscope and the bolus reaches the lower half of the esophagus, there suddenly appear numbers of ring-shaped constrictions that may completely occlude the lumen, moving neither up nor down. This usually precedes the first peristaltic wave, and when it arrives, the portion above the tight constriction distends until some of the barium is regurgitated above the peristaltic wave. In some patients the pressure is so great that diverticulae are seen to protrude and become permanent. The etiology of curling is obscure and many theories have been postulated, some of which are cited. The patient's chief complaint is usually dysphagia. Pain is referred to an area behind the lower half of the sternum. It may also go posteriorly into the mid-dorsal region. It sometimes extends upwards to the anterior thorax, neck, either external auditory meatus, or jaw. It may be centered in the epigastrium. It is usually associated with eating or drinking. Roentgenologically the condition is usually easily recognized but associated disease of the esophagus, particularly carcinoma, must be ruled out. This may sometimes prove impossible because the esophagoscope cannot be passed beyond the constricting rings. Treatment is not very satisfactory. Esophagoscopy is said to give partial relief. Repeated dilatation has helped to some extent. Psychotherapy with relief of nervous tension has helped. Atropine is usually not effective. Citing therapeutic observations of several other observers, the authors say that morphine sulfate given intravenously caused relief for several hours, amyl nitrate transitory relief and amphetamine (Benzedrine) sulfate relief for about an hour followed by worsening. A combination of hyoscyamine 0.45 mg, atropine sulfate 0.04 mg, and scopolamine hydrobromide 0.01 mg, one tablet twice a day, gave relief to patients who had associated parkinsonism. Amphetamine sulfate 5 mg every 4 hours for 36 hours gave complete relief to two patients. The 19 cases presented here were observed among a group of 2,295 patients in whom fluoroscopy of the esophagus was done. The average age of these patients was 66 years, the youngest was 49, and the oldest 84 years. The authors feel that in an aging population this condition will be found quite frequently.

Carbon Dioxide Therapy.—This report is concerned with the effect of carbon dioxide therapy in 250 patients (treated since February, 1951), most of whom had psychoneurotic disturbances. There were no psychotic patients in this group, which included many with mild depression in a form usually viewed as neurotic or reactive, some with anxiety in which depression, if present, seemed secondary to the anxiety, some with

hysterical reactions without outspoken disturbances in affect, an obsessive-compulsive phobic group often showing anxiety, and finally a miscellaneous group of patients with alcoholism, stuttering, or organic lesions and a neurotic overlay. The treatment consisted of inhalations of a 30% carbon dioxide and 70% oxygen mixture and was given by the method advocated by Meduna in 1943. After October, 1951, the treatment was modified for some patients. It was necessary to induce coma for the treatment to be effective. The number of inhalations (25 to 40) necessary to induce coma in some depressed and some anxious patients tended to accentuate the anxiety. Nitrous oxide (N_2O) was used as a preliminary anesthesia. This was much easier to breathe. After eight or nine inhalations, transfer was effected to the carbon dioxide and oxygen mixture and coma was rapidly induced. The 15 to 25 inhalations of the carbon dioxide and oxygen mixture, after the preliminary nitrous oxide, usually produced some decrease of the depression or amelioration of anxiety symptoms. The treatment was effective in about 45% of the patients and an additional 25% reported slight but definite improvement. The effect of the treatment is sustained, since the 100 cases followed for 6 to 12 months show the same proportion of improvement as the 100 cases followed for from 12 to 20 months.

Cancer of Lungs.—Of 94 male and 6 female patients between the ages of 11 and 68 with cancer of the lung observed in Cuba during the last 10 years, 94 were treated by thoracotomy and only 6 were rejected for surgery because of metastasis to supraclavicular lymph nodes or other organs. In 22 of these 94 patients a resection was not possible, 69 underwent total pneumonectomy and 3 lobectomy. Microscopic examination of the tumor was done in 77 cases and revealed squamous cell carcinoma in 49, adenocarcinoma in 25, oat cell carcinoma in 2, and 1 alveolar cell carcinoma. Of the 69 patients who had pneumonectomies, only 18 were free from involvement of the mediastinal lymph nodes, this latter group had the best survival rates. There were four operative deaths, and four patients died while still in the hospital. Of the remaining 64 patients, 1 survived for eight years, 1 for six years, 15 for four years, 19 for three years, 14 for two years, 10 for one year, and 4 for six months. These survival rates compare favorably with results obtained with surgical treatment of cancer of other organs. The authors' 71% resectability rate is much higher than that in three other series of patients with cancer of the lung previously reported by leading surgeons in the United States. The authors believe that this difference can be explained by the fact that their first patient was operated on in 1942 at a time when the general practitioner had been alerted by countless papers on the early diagnosis and surgical treatment of cancer of the lung and thoracic surgery was well developed. Early diagnosis and early exploratory thoracotomy determine the success of surgical treatment of cancer of the lung.

Selection of Patients for Mitral Commissurotomy.—Of 36 rheumatic patients with predominantly mitral stenosis who were studied by venous catheterization of the right side of the heart and by cardiac output determination, 30 were treated by commissurotomy. Two of the 30 died. Indications for commissurotomy as suggested by cardiac catheterization were ascertained as follows: (1) elevated "pulmonary capillary pressure" at rest, increasing with exercise, (2) elevated pulmonary arterial pressure at rest and during exercise, (3) reduced cardiac output at rest, with little or only slight increase during exercise, (4) arteriovenous oxygen difference elevated above normal, both in the resting and exercise states, (5) increased pulmonary arteriolar resistance and total pulmonary resistance, (6) mitral valve area decreased below 1.5 sq cm as calculated by the formula of Gorlin and Gorlin.

New Concept of Infant Feeding.—A new infant feeding regimen that rapidly converts a six hour feeding schedule to a three-meal-a-day regimen, and introduces food other than milk as early as the second day of life has been employed in 300 infants in Miami, Fla., during the past three years. Results showed that the new regimen was gratifying to its users and also a source of medical interest as these infants continued to follow closely and sometimes even surpassed the physical standards set up by babies on a more conservative routine. A more detailed survey, now in progress, would seem to emphasize the results of the author's preliminary survey done over one year ago. In addition these results would seem to be equally satisfactory in infants fed by this schedule but not under the author's direct supervision.

Tobacco Alcohol Amblyopia.—Tobacco-alcohol (toxic) amblyopia is characterized by bilateral impairment of central vision with a centrocecal scotoma initially for red and green and with an intact peripheral field. Tobacco and alcohol usually act in conjunction, though amblyopia may develop from the use of either. Most cases of tobacco alcohol amblyopia seem to come on after a depression in general health such as physical depression, undernutrition, or, less commonly, an acute illness. The histories of two patients with tobacco alcohol amblyopia are presented. The general health of these two men, aged 32 and 57, respectively, was impaired, probably as the result of improper diet. Partial loss of central vision, bilateral scotomas, and inability to distinguish red and green traffic lights were the most important eye symptoms. By diminishing their tobacco and alcohol consumption slightly and with a proper diet, including vitamin B₁, one patient recovered completely and the other partially. Apparently the vitamin B deficiency was the most important factor, and the author is unable to say to what extent tobacco and alcohol were causative factors. If the use of alcohol and tobacco is continued, visual failure may increase, and some permanent optic atrophy may develop. Sometimes a tolerance is acquired and vision may remain the same or improve slightly. No patient becomes blind. With abstinence from tobacco and alcohol, and with a proper diet, vision improves.

Acute Barbiturate Intoxication.—That the use of barbiturates and their derivatives is increasing is evidenced by the fact that the production of these drugs was 68% higher in 1951 than in 1940. Poisoning by barbiturates is likewise increasing. After briefly commenting on the pharmacology of barbiturates, Higgins discusses the etiology, symptomatology, and treatment of barbiturate poisoning. Treatment of barbiturate intoxication consists of gastric lavage, adequate oxygenation, prophylactic use of antibiotics, prevention of atelectasis and aspiration by keeping a patent bronchotracheal airway and frequent turning, and maintenance of proper fluid balance. Specific therapy includes the use of the amphetamines and picrotoxin. Picrotoxin, in the author's opinion, is the drug of choice. This powerful central nervous system stimulant can be safely given if administration is discontinued promptly at the first signs of muscular or nervous stimulation. It is short acting, being excreted in about 20 minutes. For this reason and because in the presence of barbiturate intoxications larger doses are easily tolerated, large doses should be given almost hourly until the patient remains responsive between injections. The author directs special attention to the synergism between alcohol and barbiturates, the case presented emphasizing the dangers of their concomitant use. Treatment consisted chiefly of administration of picrotoxin, and the woman recovered, however, severe narcosis and even death may occur when only one half the lethal dose of each drug, alcohol and a barbiturate, is combined. Many poisonings result from ignorance of this fact.

Rheumatoid Arthritis Treated with Irgapyrin—It is known that under nonspecific stress the pituitary gland liberates corticotropin, which in turn stimulates the adrenal cortex to secrete cortical hormones with specific actions. Of these the glucocorticoids that ameliorate the symptoms of rheumatoid arthritis are the most important. It is presumed that nonspecific agents that are effective in rheumatoid arthritis bring about the amelioration of symptoms by stimulating the pituitary adrenocortical system. On this hypothesis, Irgapyrin (a mixture of equal parts of phenylbutazone and aminopyrine) was given a therapeutic trial in 4 men and 16 women between the ages of 16 and 38 with rheumatoid arthritis. Nine of the 20 patients in whom the duration of the disease varied from four to six months had a 69.83% reduction in their total circulating eosinophils four hours after the injection of the drug, and in these patients the drug brought about almost complete relief from pain and muscular stiffness. Five patients with arthritis of from 8 to 10 months duration had a 57.89% fall in circulating eosinophils. Improvement was less pronounced in the latter group, pain and tenderness did not completely subside and some residual stiffness of the affected joints remained. Two patients with arthritis of more than 12 months' duration had a 46% reduction in the circulating eosinophils and no significant amelioration of symptoms. In the remaining four patients whose disease had been present for two and a half years, Irgapyrin did not produce any significant reduction of circulating eosinophils or any improvement in symptoms. The amelioration of symptoms by Irgapyrin thus was directly proportional to the duration of the disease. The patients who improved showed a statistically significant reduction in the circulating eosinophils four hours after the Irgapyrin injection. This suggests that the drug acts by stimulating the pituitary adrenal system. Patients who did not improve had no fall in circulating eosinophils.

Proseptasine in Treatment of Rheumatoid Arthritis—Benzylsulphanilamide ('proseptasine') in doses from 0.5 gm three times daily to 0.25 gm twice daily with nine dried yeast tablets or 1 tsp (about 4 cc) of proteolysed liver daily as vitamin B supplement was given to 49 women and 10 men with rheumatoid arthritis. Follow up was complete in 44 of 59 cases, 27 of these patients were aged 50 or more and 17 were aged less than 50. The duration of the disease ranged from 3 months to 25 years, and the duration of treatment with 'proseptasine' from 1 to 46 months. Of these 44 patients, 32 were improved, 11 were unchanged, and 1 became worse. Of 12 patients treated for a year or longer, 11 were improved and one was unchanged. The relapse rate when the drug was discontinued, was high and relapses occurred within a few weeks. When treatment was resumed the response to the drug was the same as before. There was no constant effect on the blood sedimentation rate. Toxic side-effects occurred in five patients, so that administration of the drug had to be discontinued. Prolonged treatment did not adversely influence the blood picture. Although the series was too small for drawing definite conclusions, it would appear that 'proseptasine' may help to hold rheumatoid arthritis in check until a remission occurs.

Rural Epidemic of Poliomyelitis—The occurrence of an epidemic of poliomyelitis in three adjacent rural districts of Upper Franconia, Germany, during the period from May to October, 1952, is reported. Of 83 male and 60 female hospitalized patients, 79 (55%) were between the ages of 1 and 7 years, 37 (26%) between the ages of 8 and 18 years, and 27 (19%) between the ages of 19 and 40 years. Nine of the 11 deaths (a mortality rate of 7.7%) occurred in small children and only 2 in adults. Meningism was the predominant symptom in most of the patients. Prolonged phenomena of irritation occurred occasionally in addition to pareses. In general the disease was severer during the first weeks of the epidemic than during the last weeks, pareses occurred more frequently in the beginning of the epidemic, while later on the aparetic-encephalic type was observed more frequently. The clinical course showed a tendency favorable to regression. The author considers it as highly significant that there was a high incidence of infection in persons who shared the same home, as well as in members of a whole group owing to direct contact with patients or to contact with asymptomatic carriers. Contact could be proved in 52 of the 143 hospitalized patients, and 13 chains of contact or groups of patients could be demonstrated. Thus contagiousness has been demonstrated, and careful observation of the routes of infection convinced the author that the temporary and constant carriers of the virus play a predominant part in causing by various means of transmission sporadic cases of poliomyelitis. On the other hand, the patients with the acute disease may be responsible for the occurrence of the disease in whole groups, first through direct contact (infection by droplets during the presence of respiratory manifestations) and later on by dust infection or flies. In contrast to previous observations the epidemic reached its peak in July, while there was only a mild secondary flare up in August and September. The period of the highest incidence was characterized by abnormal dryness and heat, a very low water level in rivers and streams, and a severe fly plague. As a result of his experience the author emphasizes that officially controlled measures of quarantine are imperative as a preventive means in combating the epidemic. Research should be directed to the early control of carriers of the virus.

Presacral Induction of Retropneumoperitoneum—Bekaert and associates review the history and evaluate various techniques for roentgenologic visualization of the parenchymatous organs in the retroperitoneal space, pointing out that the presacral method of insufflation was developed and first described in 1947 and 1948 by R. Rivas of Spain. They show that this method of extraperitoneal pneumography is excellent for the visualization of the adrenals, kidneys, spleen, liver, and psoas shadow. It is valuable also in the study of the pancreas and of the abdominal portion of the esophagus. It provides an easy way of inducing pneumomediastinum, and some authors assert that its preoperative use simplifies interventions on the rectum, sigmoid, kidney, and spleen because it separates the various layers. With all these advantages, the presacral insufflation technique of R. Rivas involves no greater danger than any other method of examination.

Skin Sensitivity in Nickel Eczema.—Among 58 patients with contact dermatitis who reacted positively to patch tests with one drop of 10% nickel sulfate solution there were only two in whom the primary source of the sensitivity was industrial (nickel plating). Nickel plated garters were the source in 55 patients, and a nickel plated watch in one patient. The eruption in many of these patients involved not only the primary site of sensitization but also other sites where nickel was in contact with the skin as a result of the wearing of earrings, brooches, necklace clasps, medallions, metal watch straps, and even safety pins. Furthermore 31 of these patients when first seen had secondary eczematous spread to sites other than those in contact with nickel, particularly to the elbow flexures, face, and neck. The sensitivity of 54 of these patients was reassessed after an interval ranging from 1½ to 11 years. Persisting sensitivity was confirmed in 31 by the presence of contact eczema with continued exposure, or freedom if contact was avoided, 23 patients gave negative results to patch testing for nickel sensitivity, but 18 of these continued to have eczema. It is suggested that in some of these patients, the specific sensitivity to nickel was merely a transitory phase in a series of eczematous reactions, many of them nonspecific in character. The prognosis of patients with positive patch tests to nickel involved many factors, in some it appeared to be independent of the continuance of contact with nickel. Apparently the constitutional background is often of greater prognostic significance than the specific external agent.

Retroversion of Uterus.—Of 92 women with retroversion of the uterus treated by suspension at the Victoria General Hospital in Halifax between 1925 and 1946, only 44 were followed up. Of these 44, 20 had uncomplicated retroversion, and of

these, only 7 (35%) obtained complete relief from their symptoms following the operation. Twenty four patients had associated with the retroversion some other complicating factor such as cervical erosion, cervicitis, cervical laceration, or fibroid, for which surgical intervention was also done. The uterus in all these patients was mobile. In this group 14 patients (60%) obtained complete relief of their symptoms. The authors feel that the cures obtained in these patients were due to the other surgical intervention rather than to the suspension. In a survey of 2,157 women delivered in the department of obstetrics of Dalhousie University in the last 26 years no evidence was found that the uterus observed to be retroverted at the 8th or 10th day of the puerperium drains less efficiently than the anteverted uterus. In 16 patients found to have a retroverted uterus at the seventh day post partum, in 8 (50%) it had become anteverted by the sixth week. The author believes that in a considerable number of women a change in position from ante- to retroversion and vice versa occurs continually. More medium and small than large uteri were found to be retroverted at the 10th day and at the 6th week post partum. It would seem, therefore, that neither is retroversion caused by a large uterus nor does retroversion itself cause the uterus to be large. There was no evidence that puerperal women with retroversion are more likely to have complaints referable to delivery at the sixth week post partum than the women with an anteverted uterus. There was no clear-cut evidence that retroversion predisposes to or is usually associated with uterine prolapse. It has been the author's policy never to treat a retroversion at the 10th day or 6th week post partum by pessary replacement or knee-chest position. Of 1,118 women delivered between 1928 and 1949 whose uteri were never replaced or supported with a pessary when found retroverted, 24 attributed to their delivery certain complaints such as backache and low abdominal pain. Of these 24 women, 13 were examined at the 10th day post partum and the uterus was found retroverted in only one, seven were examined at the sixth week and the uterus was found retroverted in three. Three of the 1,118 women have had suspensions done. One, whose uterus was not retroverted, had the suspension for prolapse, the two others had the operation done for sterility and neither became pregnant. It is suspected that all these findings may be equally true of the retroverted uterus in the nulliparous women, since the incidence of retroversion seems to be the same in nulliparous as in parous women. As a result of his experience, the author believes that retroversion is a normal position for the women in whom it occurs, and that, unless complicated by such conditions as endometriosis or tender prolapsed ovaries that cause dyspareunia, it is no more likely to produce symptoms than the anteverted organ. Surgical treatment of an uncomplicated retroverted uterus is unlikely to relieve the symptoms attributed to the retroversion.

Liver Function Tests in Organic Nervous Diseases.—A series of liver function tests were employed in 119 patients with diseases of the nervous system in an attempt to study the entire functional spectrum of the liver. Included in the series were the thymol turbidity test, cholesterol test, zinc sulfate test, Takata-Ara test, galactose tolerance test, hippuric acid test, and paraoxyphenylpyraccemic acid tolerance test. Determinations of serum bilirubin and urobilinogen were made, and the excretion of azorubin was tested. In patients with postencephalitic parkinsonism the results of the tests suggested latent impairment of the liver, while only minor deviations from the normal were observed in patients of advanced age with parkinsonism. In patients with paralysis agitans liver function was not disturbed. In nearly all the patients with multiple sclerosis disturbance of the liver function was indicated by the results of the paraoxyphenylpyraccemic acid tolerance test, the hip

puric acid test, and the galactose tolerance test (liver specific tests), the thymol turbidity test and the cholesterol test revealed considerable deviations from the normal. The results of these two latter tests paralleled the course of the disease. In patients with hereditary degenerative diseases deviations from normal could not be detected with the liver specific tests, and the results of the lability tests did not lend themselves to evaluation. In patients with polyneuritis, the results of the tests varied with the pathogenesis. Patients with polyneuritis associated with chronic alcoholism had positive results from the galactose tolerance test, while patients with severe Landry's paralysis and with great increase in the protein in the cerebrospinal fluid without corresponding increase in cells (as in Guillain Barré syndrome) had negative results from the specific liver function tests. Nearly three-quarters of the patients with nonspecific inflammatory diseases of the nervous system had positive results from the paraoxyphenylpyraccemic acid tolerance test, thymol turbidity, and cholesterol test. To do justice to the variety of the metabolic process, it seems important to use many methods of examination in order to determine the significance of disturbed partial function of the liver in diseases of the nervous system.

Fluorosis in the Sudan.—A focus of endemic fluorosis was discovered in the Sudan during an investigation into health and nutrition at Abu Deleig in the Butana desert in December, 1952. During the examination of schoolboys, aged 7 to 14 years, many instances of abnormality of the dental enamel were noted. These were characteristic of fluorosis and were provisionally diagnosed as such. Grade 1 changes included white, opaque, chalky areas of the enamel of permanent teeth that were most commonly seen on the cusps of premolars and first molars and on the distal half of the central and lateral incisors. Grade 2 changes included dark yellow brown discoloration, often in a pattern of broad horizontal bands or wavy parallel lines, that were most prominent in the upper incisors. Grade 3 changes were pitting and mottled discoloration of the enamel, mainly on the incisors. Grade 1 changes were found in 39.6% of 134 boys, grade 2 in 17.1%, and grade 3 in 3.7%, the total incidence being 60.4%. The incidence of caries was low. The incidence of dental fluorosis in adults was similar to that in the children. Nine out of 10 samples of well water contained fluorine in concentrations between 1.10 and 4.00 parts per million.

*Syndrome Associated with Ingestion of Chemically Improved Flour G. C. Sheldon and A. Yorke—p 577

Allergic Response to Chemically "Improved" Flour.—The authors present a detailed history of a woman, aged 50, who had no personal or family history of allergic disorders but who had had a skin disorder since 1940. The chronic eruption involved the face and neck and also the upper limbs symmetrically. It was subject to acute irregular exacerbation, and

pruritus was troublesome during the acute phase. Because of the appearance of the hands, she was treated for dysidrotic eczema but did not respond. Because depression was a dominant feature of the recurring skin episodes, accompanied by sporadic flushing, neurodermatitis associated with the climacteric was thought of, but despite varied treatment the condition persisted until 1952, with occasional exacerbations. In March, 1952, she noticed that when she came into contact with flour, it increased the severity of her existing lesions, but the result of a flour free diet indicated that ingestion rather than external irritation was responsible. An authority on the chemistry of milling provided bread prepared from flour not treated with chemicals, and the eating of such bread caused no skin lesions. Whenever she ate bread made from flour treated with nitrogen trichloride, the lesions on hands, arms, face and neck became manifest within 24 hours. The skin irritation was generally accompanied by mental disturbances in the form of insomnia, irritability, and what the patient herself identified as 'a morose depression'. An alternative to nitrogen trichloride for the chemical treatment of flour is chlorine dioxide, and so the authors decided to ascertain the effect on their patient of flour treated with this chemical. The woman was given bread prepared from flour treated with chlorine dioxide unknown to her. Within three hours of eating this bread, she had pruritus of the hands and forearms, and within 24 hours there was pruritus of face and neck, which felt "dry and tight," together with anorexia and insidious mental depression. Examined after 48 hours, she presented essentially the same clinical picture as that following ingestion of flour treated with nitrogen trichloride, but some of the symptoms, particularly the constitutional ones, such as anorexia, were severer. The question arises of whether this is a rare case of allergy or merely the first recognition of a common disorder.

Erythroblastosis Fetalis and Blood Group Kell J. J. van Loghem, Jr. H. de Raad and A. van Haltem—p 63

Corticotropin and Cortisone in Rheumatic Carditis.—Van Creveld and Kuipers show that the prognosis of rheumatic carditis becomes more unfavorable as the number of relapses increases. Fatalities from this disease are due chiefly to the sequelae, that is, to valvular lesions. Apart from the prevention of relapses by prophylactic methods, the authors feel that improvement in prognosis will be effected mostly by early treatment of the rheumatic carditis with corticotropin and cortisone. From a survey of the literature the authors gained the impression that early treatment with adequate doses can prevent persistent damage, such as valvular lesions, in a considerable number of cases. They present the histories of seven patients in whom they employed cortisone. Two children died, but in two others a fatal outcome was prevented by the treatment. All children showed evidence of a valvular lesion after treatment was completed, despite the fact that it was instituted within two weeks after the first clinical signs of cardiac involvement appeared. From the literature, the authors gained the impression that corticotropin might be more effective than cortisone in preventing valvular lesions.

Streptomycin Combined with Congo Red in Tuberculous Meningitis.—Streptomycin combined with congo red in a 1:9 ratio was given to two persons with tuberculous meningitis to study the meningeal permeation and evaluate the levels and

the elimination curves of the antibiotic in the spinal fluid. In one of the patients the blood levels were also determined. After one intravenous injection of 0.5 gm, the streptomycin level in the spinal fluid was 2 μ g per cubic centimeter and it doubled within the second hour. In the blood, however, the concentration was lower, and it did not increase after the first hour. Moreover, the antibiotic was not present in the blood 10 hours after the injection, whereas it was still found in small traces in the spinal fluid 24 hours later. The preparation seems to become fixed electively in the inflamed meninges, and since the transudate current proceeds from the blood to the fluid, the higher levels that were found in the latter are easily understood. When after 24 hours an additional 0.5 gm was injected, the streptomycin level in the spinal fluid was 8 to 10 μ g per cubic centimeter, but 24 hours later it was again 4 to 5 μ g. This dose was repeated every 24 hours for several days and a cumulative effect was observed, however, 24 hours after the injection never more than 4 to 5 μ g of streptomycin were found per cubic centimeter of fluid. The cumulative effect in the fluid is analogous to the effect it had in the tissues as the authors had previously demonstrated in another study. After the first two days of therapy, the fluid, like the tissues, assumed a pinkish color, which became progressively red. The intensity of the color was directly proportional to the concentration of the preparation in the fluid.

Fatty Degeneration of Liver After Aureomycin Therapy—A 7-year-old girl was hospitalized in severe general condition with acute diffuse peritonitis due to a perforating appendicitis. Successful laparotomy was performed, and the early postoperative course, during which the patient was given aureomycin in addition to other medications, was good. On the day of the operation and the first and second postoperative days she received intravenously 100 mg of the drug every four hours (an average of 24 mg per kilogram of body weight), and on the third and fourth days 250 mg orally every four hours (an average of 60 mg per kilogram of body weight). A total dose of 4,800 mg was given. The patient's general condition was improving and recovery seemed to be assured, when suddenly on the sixth postoperative day, elevated temperature, tachycardia, dyspnea, mild diffuse edema, subicterus at the sclera, and signs of hemorrhagic diathesis were observed. Small amounts of black urine containing large quantities of albumin and urobilin, and hyaline and granular casts were passed. The Takata Ara test indicated pronounced liver damage. A picture of hepatorenal coma developed, and the patient died on the eighth postoperative day. At autopsy all signs of peritoneal inflammation had disappeared. The liver, however, was greatly enlarged, tender, flabby, doughy, and opaque dark yellowish colored. Microscopic examination revealed fatty degeneration that was more pronounced near the Kiernan's spaces, the trabeculae could no longer be distinguished, but there were no alterations in the capsule. The kidneys were also slightly enlarged but had a normal consistency, dark yellowish lines could be seen through the capsule. The child had recovered completely from peritonitis, but had died of acute hepatorenal insufficiency secondary to fatty degeneration of the liver caused by the toxic effects of aureomycin. The author suggests that the degenerative effect of aureomycin on some essential organs is due not to a toxicity intrinsic to the drug itself but rather to the peculiar constitution and the specific reaction of some allergic persons. Excessive doses and the intravenous route of administration may also be responsible for these side-effects.

- Dysmenorrhea From Social Medical Point of View. K. Bockhorn—p 189

Prolonged Controlled Hypotension in Treatment of Intracranial Hemorrhages—Depressin, a proprietary hexamethonium chloride preparation, was employed to produce prolonged controlled hypotension in a 39 year-old woman in her third

attack of apoplexy and in a 43 year-old woman who after an attack of influenza suddenly had become unconscious and paralyzed on her left side. In the first patient the blood pressure was maintained for 12 hours at 80/55, this induced hypotension was produced by intravenous injection of a total dose of 380 mg of the ganglion blocking agent and postural ischemia combined with continuous administration of oxygen. After seven hours of controlled hypotension Babinski's sign and clonus disappeared on the left side. After nine hours Babinski's sign disappeared also on the right side, but recurred after 11 hours, and the patient died suddenly 12 hours after the start of the controlled hypotension. Necropsy revealed hypertrophy of both ventricles, general vascular sclerosis, a recent focus of softening in the right internal capsule, and old foci of softening in the basal ganglia. In this case, the disappearance of the pathological reflexes during controlled hypotension is to be considered noteworthy. In the second patient who was in deep coma with symptoms of acute cerebral hypertension and increasing deterioration of her general condition, the systolic blood pressure of 240 mm Hg was reduced to 50 mm Hg by the intravenous administration of an initial dose of 60 mg of hexamethonium chloride, and blood pressure was maintained for 17 hours at values varying from 40 to 60 mm Hg by the administration of a total dose of 300 mg of the drug. The systolic blood pressure then gradually rose to 80 mm Hg and remained at this level until 25 hours had passed from the start of the induced hypotension. The patient then awakened and orientation was perfect. After 10 hours of controlled hypotension, paresis and Babinski's sign had disappeared. Arteriography of the carotid artery and lumbar encephalography did not reveal definite pathological changes. Lumbar puncture revealed more than 500 leukocytes and a high protein content in the spinal fluid. A tentative diagnosis of encephalitis was made, the patient was treated with antibiotics, and she was discharged free of complaints six weeks after admission to the hospital. The patient died six weeks later, and necropsy revealed diffuse demyelination of the white matter of the hemispheres, severe lesions of the basal ganglia, and neuronal degeneration of the brain stem.

Examination of Lead Line in Ultraviolet Light—The lead line at the gums of patients with lead poisoning represents a deposit of lead sulfide that results from the action of hydrogen sulfide, which is present in the mouth (particularly if teeth are not kept clean), on the lead albuminate excreted by the capillaries of these patients. This results in a bluish black discoloration at the edge of the gum. Stimulated by reports on fluorescence phenomena in the oral cavity, particularly the red fluorescence of dental tartar, Dangel and associates examined the gums of persons with and without lead poisoning under ultraviolet illumination. In a definite lead line there appeared under the ultraviolet light a dark zone that differed from the bluish fluorescing gums. In one patient with lead poisoning the dark line was seen to gradually disappear while he received treatment for lead poisoning. In some doubtful cases a narrow lead line could be clearly differentiated from dental tartar under the ultraviolet light, but in others in whom examination under ordinary light suggested a lead line examination under ultraviolet light clearly demonstrated merely the red fluorescence of dental tartar. The authors admit that the bismuth line, which may develop in patients receiving bismuth in the treatment of syphilis, cannot be differentiated from the lead line under ultraviolet light, but the occupational and clinical history should explain whether lead, bismuth, or mercury is the cause.

BOOK REVIEWS

Hypnosis in Modern Medicine. Edited by Jerome M. Schneck, M.D., Clinical Associate in Psychiatry, College of Medicine, State University of New York, Brooklyn. Cloth. \$7.50. Pp 323. Charles C. Thomas Publisher 301 327 E. Lawrence Ave., Springfield Ill. Blackwell Scientific Publications Ltd. 49 Broad St. Oxford England. Ryerson Press 299 Queen St. W. Toronto 2B 1953

Since the first child was rhythmically crooned to and rocked by its mother and since the first patient was calmed and soothed by the first medicine man, suggestion and hypnosis have retained their essential place among the healing arts. The variegated heritage of such therapeutic practices has never quite lost its magical attraction. Proof of this are the four main derivatives of Mesmer's "animal magnetism" today: the cults of the "magnetic belt" and devices still sold by the millions to the gullible, Christian Science as derived from Mesmer through his disciples Phineas Quimby and Mary Baker Eddy, psychoanalysis via the hypnotists Charcot and Bernheim and their student Sigmund Freud, and the current vogue of hypnosis itself. The wishful yearnings underlying such regressively esoteric approaches to therapy have given rise, since Mesmer's death, to thousands of books on hypnosis, this volume is the latest.

According to its editor, the distinguishing characteristic of this book is that each section was written by an expert with special experience in his subject. The first chapter, a historical account of medical hypnosis written by George Rosen, sets a high standard by reviewing the unscientific origins and fantastic nature of much of the theory about hypnotic phenomena. Unfortunately, many of the other contributors seem not to have studied this introduction very carefully, indeed, William T. Heron, in his section on instruction in hypnosis, states "Actually, there is little in the history of the subject which is useful to the modern practitioner" (page 289). In line with this, the various intervening chapters on hypnosis in internal medicine, surgery, anesthesiology, obstetrics and gynecology, and dentistry repeat a pattern that is now familiar to the serious student of hypnology, a pattern of clinical daring leading to striking observations of significant phenomena, unfortunately followed too often by uncontrolled interpretations and over-enthusiastic therapeutic inferences. As exceptions to this, the chapters by Schneck and by Ambrose on hypnosis in adult and child psychiatry are good surveys by writers obviously familiar with special techniques, but, here again, the work of others is too often accepted on purely impressionistic bases. With regard to the physiological substrate of hypnosis, M. J. Bass, after a somewhat diffuse review of the literature, concluded, "Although hypnosis differs from sleep at the present time, however, reliable criteria for distinguishing hypnosis from the waking condition are not available" (page 251).

The volume is well documented and indexed and should be a useful addition to the reference library of any psychiatrist, psychologist, or research worker already active in the field. Some of its contents, however, may be misleading to general practitioners, medical students, and others who, without specialized training and experience, may attempt to apply certain of its recommendations to clinical practice.

Hearing Aids: Their Use, Care, and Repair. By Matthew Mandl. Cloth. \$3.50. Pp 158 with 64 illustrations. The Macmillan Company 60 Fifth Ave. New York 11 1953

The construction and operation of the modern electronic hearing aid are presented briefly and simply in this short book. It is well illustrated with photographs and line drawings and should be of interest to hearing aid users who have some knowledge of radio electronics. The physician, audiologist, and hearing aid salesman interested in basic hearing aid principles will find this book a helpful introduction to the subject.

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated.

Textbook of Virology for Students and Practitioners of Medicine. By A. J. Rhodes, M.D., F.R.C.P., Research Associate, Connaught Medical Research Laboratories, School of Hygiene, University of Toronto, Ontario, and C. E. van Rooyen, M.D., D.Sc., M.R.C.P., Research Member, Connaught Medical Research Laboratories. Second edition. Cloth. \$8. Pp 561 with 76 illustrations. Williams & Wilkins Company, Mount Royal and Guilford Aves., Baltimore 2, 1953

This textbook covers viral as well as rickettsial infections of both man and animals, with emphasis on human diseases caused by or associated with these agents. The authors have wisely avoided the unsettled formal classification of viruses and rickettsias by grouping the subject matter according to the regional and clinicopathological characteristics of the infections. The first and larger portion of the book is devoted to virus infections and is introduced by a discussion of their fundamental characteristics, response to specific therapy, and laboratory diagnosis. The general biological character of rickettsias is similarly presented to introduce the smaller portion of the text. Discussions of both types of infection are presented under the names of the diseases, a feature that will appeal to medical students and practitioners. The authors present the following aspects of each disease: clinical features, pathology and pathogenesis, epidemiology, properties of the causal agent, immunity, specific treatment, and laboratory diagnosis. Ample space is given to discussion of the immunologic reactions important in the diagnosis and study of viruses and rickettsias. The authors are obliged to utilize numerical and alphabetic symbols that have been introduced to identify various strains and types of these micro-organisms, but the retention of such chemical abbreviations as LGI for lymphogranuloma inguinale (venereum), EKC for epidemic keratoconjunctivitis, CCA for chick cell agglutination, and HA for hemagglutination tests should not be encouraged. The abbreviation ACTH is also employed in place of the adopted generic name, corticotropin.

The second edition of this textbook will be welcomed by teachers, students, and physicians as a highly practical source of basic information for both introductory and advanced studies of the subject. Each section is followed by references, and the general index is arranged for convenience in locating the available information. At the time of printing, the results of the recently reported studies on the prophylactic use of gamma globulin in poliomyelitis were not available to the authors.

Comotio Cerebri: Cerebral Concussion and the Postconcussion Syndrome in Their Medical and Legal Aspects. By Cyril B. Courville, M.D., Director, Ramon Cajal Laboratory of Neuropathology, Los Angeles County Hospital, Los Angeles. Cloth. \$5.25. Pp 161 with 12 illustrations. San Lucas Press, 316 N. Bailey St. Los Angeles 33, 1953

This is a practical book for students and practitioners. It is of special value to attorneys and expert witnesses, those who have to deal with the problem in court. The author has reviewed not only the medical but also the general literature. He has drawn many descriptive references to the symptomatology of concussion from legends, folk tales, and history. It is clear that concussion has been universally recognized as a distinct clinical entity. The review shows how physicians related themselves to the problem and how knowledge of the subject slowly developed through the centuries.

The author is impressed by the fact that persons who suffer from simple concussion too often are not adequately compensated, and that attorneys and physicians employed by insurance companies frequently decide that affected patients are intentionally attempting to defraud.

The book is particularly valuable in its analysis of the mechanism of concussion. Symptoms, diagnosis, and management are adequately discussed. Two distinct schools of thought have arisen, one concludes that all post-traumatic symptoms are to be explained on an organic basis, the other, at the opposite extreme, assumes that all post-traumatic symptoms in concussion are purely functional and should be ignored.

The author concludes that the characteristic residual symptoms of commotio cerebri cannot be lightly dismissed as malingering or a compensation neurosis, that, while purely psychic postconcussional manifestations may also occur, the counterfeiter need not be confused with the genuine, and that an intelligent, comprehensive therapeutic approach to the problem has potentialities for quicker relief of the patient's symptoms and for lowering of cost to insurance carriers.

Practical Clinical Chemistry: A Guide for Technicians. By Alma Hiller, Ph.D. Associate Attending Biochemist in Charge of Clinical Chemistry, Presbyterian Hospital of City of Chicago. Cloth \$6.50. Pp. 266. Charles C. Thomas Publisher, 301 327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications Ltd., 49 Broad St., Oxford, England; Ryerson Press, 299 Queen St. W., Toronto, 2B, 1953.

This book is well written, and the style is simple enough so that even the technician untutored in chemistry may easily use it. An outline for each procedure follows a comprehensive narration and explanation of the principles and techniques involved. These outlines are reprinted on detachable, perforated sheets at the back of the book for the convenience of the technician.

The selection of methods is generally excellent. The only controversial method is that for the estimation of nonprotein nitrogen of blood. The hypobromite deamination method presented is certainly simpler than the old micro-Kjeldahl method, but there is much contradictory literature concerning it, and at least one researcher reports yields as low as 78% of the true nonprotein nitrogen content with the hypobromite deamination method. The author has selected many methods that require the use of a spectrophotometer. For some time, spectrophotometers have been within the economic reach of analytical laboratories, however, for those laboratories still not equipped with spectrophotometers, the usefulness of this book might have been extended by presenting, for each colorimetric assay, an alternate procedure in which a visual colorimeter is used. It should be made quite clear, however, that the superior accuracy of the spectrophotometer is adequate reason for its selection over a colorimeter if the choice can be made.

Dysarthric Speech (Speech in Cerebral Palsy) By Emil Froeschels, M.D., President, International Society for Logopedics and Phoniatrics. New York: Magnolia, Mass., 1952. \$3.75. Pp. 172. With 34 illustrations. Expression Co., Publishers.

Defective speech, particularly in the cerebral palsy patient, is considered in this text. The anatomic lesions of the central nervous system and the vocal mechanisms that account for dysarthric speech are presented briefly. The use of proper neuroanatomic nomenclature in the rather limited discussions requires that the lay speech therapist, for whom the book is primarily written, have a good basic understanding of neuroanatomy in order to gain much from this portion of the text. The congenital dysarthrias and those acquired early in childhood are considered from the symptomatic and therapeutic standpoint. These same basic principles may also be applied to the dysarthrias resulting from injuries and cerebrovascular accidents in adults. The format of the book is attractive, and it is illustrated with simple line drawings. Much interesting reference material is also included.

Preventive Aspects of Chronic Disease: Conference Proceedings, March 12-14, 1951, Chicago, Illinois. Sponsored by Commission on Chronic Illness. Co-Sponsors: National Health Council, U. S. Public Health Service. Paper \$2.50. Pp. 311. Health Publications Institute, Inc., Raleigh, N. C., 1952.

This is a report of the conference of physicians, social workers, and others representing 43 organizations interested in prevention of chronic disease. These diseases are characterized by permanence, residual disability from some acute condition, and an irreversible disease process. Special instruction is necessary for the patient and all who attend him in order that some degree of rehabilitation might be obtained. A long period of observation, supervision, and care must be expected. This involves early diagnosis, thorough and complete cure of the acute condition if possible, and follow-up from the social as well as the medical side of the problem. The physician is not always sure when he has cured a patient completely. Symptoms

may subside, but the condition may become permanent before anyone is fully aware of what has happened. Multiple sclerosis and poliomyelitis are examples of such conditions, and chronic arthritis is always possible in any case of acute rheumatism.

Prevention is the keynote of this 300 page monograph, but all of its authors are well aware of the limitations of the World Seventeen diseases are discussed, and the factors of heredity, predisposition, and carelessness and neglect through ignorance and willful disregard of the principles of hygiene and sanitation are considered. Much of the present knowledge of chronic diseases is included, along with problems that require further study, analysis, and integration.

Plastic Surgery at the New York Hospital One Hundred Years Ago with Biographical Notes on Gurdon Buck. By Herbert Conway, M.D., and Richard B. Stark, M.D. Forewords by John Hay Whitney, Stanley Bayne Jones, M.D., and Frank Glenn, M.D. Cloth. \$5. Pp. 110. With 11 illustrations. Paul B. Hoeber, Inc. (medical book department of Harper Brothers), 49 E. 33rd St., New York 16, 1953.

This small volume tells the story of the development of plastic surgery at the New York Hospital 100 years ago. It is the story of Gurdon Buck, bold and imaginative surgeon, who is regarded as the pioneer of plastic surgery in the United States. Buck is probably remembered by the medical profession mainly for "Buck's extension" and "Buck's fascia," but his most important contributions were in the field of plastic surgery. In 1876 he wrote an important treatise on the subject that was translated into three languages. This book is attractively printed and is illustrated with photographs of patients operated on by Buck. It should be of interest to surgeons and to the medical profession in general.

The Biochemistry of Gastric Acid Secretion. By Edward J. Conway, M.D., D.Sc., F.R.S. Professor of Biochemistry and Pharmacology, University College, Dublin, Ireland. Publication number 119. American Lecture Series monograph in Bannerstone division of American Lecture in Biochemistry and Biophysics. Edited by W. Bladergreen, Jr., Ph.D. Cloth. \$6.50. Pp. 185. With 29 illustrations. Charles C. Thomas Publisher, 301 327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications Ltd., 49 Broad St., Oxford, England; Ryerson Press, 299 Queen St. W., Toronto, 2B, 1953.

Dr. Conway deals with the site of gastric secretion, with ways of stimulating it, with various theories that have been advanced on its formation, both from a chemical standpoint and from the standpoint of energetics, and with the protective role of gastric urease. Except for five pages on the treatment of gastric ulcer with urea, the book does not include therapy. Throughout the book, parietal cells and yeast cells are compared, obviously the latter are easier to study, and more is known of their biochemical processes. The writing is clear, and the illustrations are adequate. The material is made available through a detailed table of contents, summaries for each chapter, and indexes. The bibliography is 10 pages long. Printing and binding are excellent.

Doctor in the House. By Richard Gordon (pseud.). Cloth. \$2.75. Pp. 186. Harcourt, Brace and Company, Inc., 383 Madison Ave., New York 17, 1953.

In this amusing, nostalgic account of the life, labors, and loves of an English medical student in one of London's hospitals, the author describes with gentle humor his struggles with his studies, his trials with some of his teachers, escapades with fellow students, flirtations with nurses, clinical trial and error with the help of patients, and drinking bouts at the King George pub. Some parts of the book are highly entertaining. There is, for example, the colorful description of the nurse in charge of obstetrics students who could talk only about mothers and newborn infants and thought of everyone solely as a reproductive mechanism. When discussing obstetric anatomy she always awarded the parts of the birth canal to the listener. When your cervix is fully dilated, she cautioned the medical students, "you must decide whether to apply your forceps to your baby. You must feel to see if your head or your breech is presenting." And in response to the question "Suppose it's your shoulder or your left ear?" she replied without hesitation, "Then you put your hand in your uterus and rotate your child." There is much more in a similar vein. This book can provide several hours of enjoyable reading.

QUERIES AND MINOR NOTES

EXCRETA FROM TOILETS ON TRAINS

TO THE EDITOR—About two years ago I read that the nation's railway trains, as a result of their open plumbing, may be disseminating poliomyelitis virus throughout the country. At a pediatric meeting in Danville, Pa I talked with other physicians who have wondered about this. It should be possible, by adding a dye to the water in train toilets to determine the amount of contamination. Has any such study been made?

M.D., New York

This inquiry was referred to two consultants, whose respective replies follow—Ed

ANSWER—A quantitative study of human excreta flushed from toilets on railway passenger cars was made a few years ago under the auspices of the Joint Committee on Railway Sanitation of the Association of American Railroads operation and maintenance department. A brief summary of the findings and references to the original reports may be found in an editorial on "Railroad Toilet Wastes" (*J A M A* 137:1134 [July 24] 1948). There appears to be no substantial direct evidence of the importance of railroad toilet wastes in the spread of poliomyelitis.

ANSWER—The most recent authoritative large scale survey of this problem was conducted by the sanitary research project of the Joint Committee on Railway Sanitation, on which were representatives of the United States and Canada's public health services and the engineering, mechanical, and medical sections of the Association of American Railroads. The results of that study, which involved over four years of research and experimentation, were as follows: 1. No evidence was found that sewage wastes from railroad passengers have caused outbreaks or epidemics of communicable enteric disease. 2. The presence of coliform bacteria in railroad ballast, in runoff from roadbeds, and in the atmosphere of fast moving trains is no greater than in other environments generally considered not inimical to good health. 3. The amount of fecal solids discharged to the railroad right of way from passenger trains is exceedingly small, it is estimated to average for all passengers in the United States less than 1 oz. per yard (91.4 cm) of track per year. It was pointed out, however, that whether any undetected relationship actually exists between present disposal methods and the enteric diseases and possibly poliomyelitis like diseases is not known at present. The report proposed that the problem be studied continuously and that hoppers be provided for transitory retention of waste in certain areas in which the deposition may conceivably constitute a hazard despite the inability to demonstrate one objectively. None of the authorities consulted by the project personnel believed that railroad passenger waste plays a significant part in the spread of poliomyelitis. In about 10,000 references reviewed by members of the project, the role of the railroads in this connection was mentioned six times, but in none was more suggested than that railroad toilet waste may possibly be a reservoir of the virus.

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address but these will be omitted on request.

TREATMENT OF NEUROSYPHILIS

TO THE EDITOR—What is the modern viewpoint on the treatment of cerebral and meningovascular syphilis? Is penicillin alone sufficient in every case? What tests indicate a cure, in view of the fact that some patients have irreversible abnormal Lange gold curves, positive blood Wassermann test reactions, and, perhaps positive spinal fluid Wassermann test reactions? One patient shows hypersensitivity (reaction not indicated on her chart) to penicillin. Does this indicate use of the older form of treatment with arsenic or is oxytetracycline (Terramycin) therapy worth trying?

Thomas M. Shannon, M.D., Morganton, N.C.

ANSWER—It is difficult to answer these questions without some preliminary clarification. By meningovascular and cerebral syphilis it is assumed the inquirer means neurosyphilis. There are a number of accepted classifications of neurosyphilis, all of which are considerably more detailed than the two terms employed in the question. Most syphilologists and neuropsychiatrists would agree on some such simple classification as the following one: (1) asymptomatic neurosyphilis, early (infection less than four years in duration), (2) asymptomatic neurosyphilis, late (infection more than four years in duration), (3) acute syphilitic meningitis (usually a manifestation of early syphilis), (4) diffuse meningovascular neurosyphilis, (5) tabes dorsalis, (6) dementia paralytica (general paralysis of the insane), (7) other rarer manifestations, such as Erb's spinal spastic paraplegia and vascular neurosyphilis. "Asymptomatic neurosyphilis" means, of course, neurosyphilis manifested only by abnormalities in the spinal fluid, without neuropsychiatric symptoms or signs.

Penicillin may be used in the treatment of all types of central nervous system syphilis and may be administered by various systems. One is to administer aqueous penicillin G to the hospitalized patient, in a dose of from 100,000 to 500,000 units or more every three to four hours, around the clock, to a total dose over 10 to 14 days of 10 million units or more. Many competent observers now treat most patients with neurosyphilis on an ambulatory basis, utilizing a repository penicillin preparation, usually procaine penicillin G in aqueous suspension or an oil with 2% aluminum monostearate added. Also usable for this purpose are the penethamate hydriodide (Neo penil) and N,N'-dibenzylethylenediamine dipenicillin G (Bicillin). The particular advantage of penethamate hydriodide has been reported to be appearance of a greatly increased concentration of penicillin in the cerebrospinal fluid following intramuscular administration and the advantage of Bicillin to be unusual prolongation of therapeutic blood levels (7 to 10 days) after a single intramuscular injection of 600,000 units. With any of the repository penicillin preparations, the usual practice is the administration of single injections of 600,000 units each at one to three day intervals until a total of 10 to 12 million units has been given.

Penicillin alone is satisfactory for the treatment of most patients with neurosyphilis and certainly for the majority of those with clinical forms other than parenchymatous neurosyphilis (tabes dorsalis or general paresis). In many patients with tabes dorsalis, penicillin alone is not completely satisfactory in the relief of symptoms and the proper management of such patients is often a complex medical procedure, necessitating specialized methods of approach (fever therapy, especially with induced tertian malaria, and neurosurgical procedures for the relief of gastric crises). In one particular complication of tabes dorsalis, namely, primary optic atrophy, evidence is not yet available as to the efficacy of penicillin therapy in bringing about arrest of the atrophic process. Many observers still feel strongly that treatment in such patients should consist of fever therapy, with induced tertian malaria,

combined with penicillin administration. In patients with general paresis, the use of penicillin for the initiation of treatment creates about a 10% risk of serious clinical Jarisch-Herxheimer reactions, which may be avoided by initiating treatment with fever therapy, penicillin therapy being delayed until the patient has had two or three paroxysms.

It is not quite accurate to use the word "cure" in speaking of the treatment of neurosyphilis. This word may be applied only to the inflammatory component of the lesion or, to put it differently, to the possible "cure" of the underlying treponemal infection. A cure of symptoms and signs produced by actual degeneration within the nervous system is not possible. From the laboratory point of view, the efficacy of treatment in neurosyphilis may be measured by the cell count and the protein content in the spinal fluid. In 95% of all neurosyphilitic patients treated with penicillin, both the cell count and protein content usually promptly (within six months) become normal and usually remain so. Having once reverted to normal, a subsequent increase in cell count or protein content may be interpreted as relapse of the inflammatory component of the neurosyphilitic lesion and as an indication for retreatment. This is the so-called Dattner-Thomas concept of "active" versus "inactive" spinal fluid and is thoroughly documented in the literature. Patients who are hypersensitive to penicillin G may usually be satisfactorily treated with either fever therapy or one of the nonallergenic penicillins, such as penicillin O. Metal chemotherapy in such patients or, indeed, in neurosyphilis in general, has been almost completely abandoned. The broad spectrum antibiotics, aureomycin, oxytetracycline and chloramphenicol, are less effective than penicillin.

VITAMIN B GIVEN INTRAVENOUSLY

TO THE EDITOR—*Is there any explanation for the fact that a chronically fatigued woman feels more energetic following intravenous injection of vitamin B? This increased energy and well-being is said to last for a week or longer. The woman is about 40, has four children, is socially prominent, was athletic and is in apparent good health. It is my feeling that this result has more of a psychic than a physiological basis.*

M D Ohio

This inquiry was referred to two consultants, whose respective replies follow.—ED

ANSWER—The good effect obtained from the administration of vitamin B once a week probably has a psychic basis. It is unlikely that there is a deficiency of this substance in a healthy woman who is on a well balanced diet.

ANSWER—The increased sense of well being described by the patient is probably psychogenic. It is doubtful whether there is any clinical indication for intravenous administration of vitamin B other than the presence of wet beriberi. Sensitization reactions following intravenous administration of thiamine chloride have been observed, some severe enough to cause death.

SINUS BRADYCARDIA

TO THE EDITOR—*An 86 year-old woman, well and happy, had the pulse rate of complete heart block, 40 beats per minute. On Jan. 3, 1953, she had an acute cold, with difficulty in breathing and her blood pressure was 190/110. I was surprised to find the pulse of heart block, absent the rate being 64. She has long since recovered from the cold and is again well. I have never heard of a heart block adjusting itself to a normal heart beat. Is this an unusual case? The patient has been receiving no medication that would affect her heart condition.*

M D Iowa

ANSWER—Sinus bradycardia with a pulse rate of 50 to 60 beats per minute is common in many normal persons of both sexes and in all age groups. Occasionally, as on first awakening in the morning, the rate may fall to between 40 and 50 in such persons. An electrocardiogram is usually needed

to establish the presence and degree of heart block. For example, a heart rate of 40 might be associated with an auricular rate of 80, with a 2:1 atrioventricular block, or, rarely, it may be due to atrioventricular nodal rhythm. Complete heart block ordinarily results in an independent ventricular rate of 35 or below. In older persons, it is usually caused by coronary heart disease, although angina pectoris, congestive failure, or myocardial infarction need not be associated as part of the clinical picture. Temporary complete heart block is occasionally seen accompanying an infarction of the posterior wall of the left ventricle. It may also occur with narrowing of the vessels supplying the junctional tissues with blood where the atrioventricular block varies with the activity of the person and the state of the circulation.

AZOOSPERMIA

TO THE EDITOR—*I have been treating a 30-year-old man for sterility. I have given him vitamin E (100 mg) twice daily and testosterone (25 mg) twice a week. Examination of the seminal fluid at the beginning of treatment revealed no sperm, and recent examinations revealed no sperm. This patient had mumps when a child. One testicle appears normal in size and the other is slightly atrophied. What suggestions can you make for treatment?*

B C Kappmeyer, M.D. Hamilton Ill

ANSWER—To determine the proper treatment in this case, certain tests should be made to establish a diagnosis. In azoospermia, such as appears here, bilateral testicular biopsy of the serialized type should be performed. If the biopsy material, taken from several areas of each testicle, shows normal spermatogenesis, a diagnosis of bilateral absence or obstruction of the avenues of sperm outlet is justified. If the biopsies show temporary arrest due to pituitary insufficiency, injections of a potent pituitary product might be beneficial. If, on the other hand, the biopsies show marked peritubular fibrosis or marked diminution in the number of germ cells, treatment is not likely to be of any avail. Vitamin E, when given in sterility, is used on psychological grounds, only. The importance of following the ordinary hygiene of living should be stressed.

POSSIBLY NEUROGENIC HYPOGLYCEMIA

TO THE EDITOR—*The question of Dr. Joel Peterson of St. Paul in THE JOURNAL for April 18, 1953, page 1463, interested me greatly. The history of undue fatigue, nervousness and abnormal craving for sweets with a normal fasting blood sugar level certainly indicates hyperinsulinism or so-called neurogenic hypoglycemia. A six hour glucose tolerance test would no doubt show the hypoglycemia. Regardless of the outcome of the test, the symptoms call for a diet test. Improvement with the proper diet should be spectacular in one or two weeks. This diet is one high in protein, low in carbohydrates and high in fat with no sweets or caffeine and with frequent feedings. The diet recommended by Dr. Seale Harris is still the best. If all physicians would read the work of Dr. Seale Harris on dysinsulinism and hyperinsulinism (J A M A 83:729 [Sept 6] 1924; Ann Int Med 10:514 [Oct] 1936) as well as Body Mind and Sugar, by Dr. Abrahamson (New York, Henry Holt & Company, Inc., 1951), thousands of persons would not have to go through what I did. During three years of severe illness I was examined by 14 specialists and 3 nationally known clinics before a diagnosis was made by means of a six hour glucose tolerance test. Previous diagnoses having been brain tumor, diabetes and cerebral arteriosclerosis. Seeing the six hour cure I found the answer in Dr. Seale Harris's diet and immediately recovered.*

Since then I have used this hard earned knowledge in diagnosing and curing the condition in numerous patients, in some of whom the blood sugar level like mine, at times dropped to 50 mg per 100 cc.

Stephen Gyland, M.D.
